INDEX TO ILLUSTRATIONS IN VOLUME FORTY-THREE.

A

"A Day Off," 401
 Adobes as a Building Material (4) 411
 Agricultural Inventions—Feb. 73—
 74—March, 121-122—April, 171-172—
 May, 220—June, 264—July, 304.
 Allen, A. B. 483
 Antlers of Irish Elk. 28
 Apparatus for a Clyster. 543
 Apparatus for Honey Drying. 281
 Apple Blossoms. 218
 Apples in Barrel. 363
 Apricot, The. 66
 April Days. 145
 Asparagus Bunching. 34
 Australian Wool Farming. 330
 Awnings for Dwellings. 299
 Axe, Fence Post. 306

B

Bacteria. 64
 Bacteria, Magnified. 498
 Ball Holder, A. 380
 Barberries, Evergreen, The. 115
 Barn, \$700, Plans (6), 293—Cattle
 Hillside, Plans (7), 157—Door
 Fastening, 99—Door Latch, A, 151
 —Flooring (5), 18—Florida, A (2),
 410—Medium-sized, Plans (6),
 203—Remodelled (4), 48—(5) 96—
 Small, Plans (8) 4—(3) 253.
 Barrel Coops, Improved. 100
 Barrow, Barrel, A, 374—Rack, 12—
 Wheel, Handles, 112.
 Bars, Sliding Support. 7
 Basin, Silt, Wooden. 196
 Baskets, Fruit and Flower. 378
 Bear-Trap, Saved in a. 26
 Bedroom in Cretonne. 340
 Bee-Feeder. 364
 Bee-Hive, Winter Cover. 403
 Bee-Tent, A. 320
 Beef, Elevating. 5
 "Beneath the Skies of May" 193
 Birds, Interesting. 263
 Blackberries, "Early Harvest" 282
 Blackberries, The New. 22
 Block, Sand-paper, A. 69
 Board, Squaring, A. 162
 Book-covering, A Neat. 24
 Boot-Jack. 167
 Boot Scrapers, Home-made. 24
 Box, Coal, 300—for Plants (2), 65—
 Mailing, for Plants (2), 490—Nest,
 A, 51—Salt and Ash, 416—Wagon,
 A, 52—Window, A, 166.
 Boxes, Transplanting. 163
 Bracket, Corner, A. 63
 Brake, Wagon, A. 203
 Broccoli, Branching, New, A. 257
 Broom, Hanging, A. 340
 Bucket for Bored Well. 326
 Bull with Head-Gear. 197
 "Bunny," A Poor Show for. 17

C

Cabinet, Corner Medicine, A. 425
 Cabinet, Wall. 260
 Canaries, Old and New in. 488
 "Carrying a Joke Too Far" 168
 Carving, Line. 69
 Cattle, Angus, 485—Ayrshire, 305
 —Browsing, Preventing, 11—
 Butter Maker and Beef Breed (2),
 385—Guernsey (2), 321—Heads, 530
 —"Holstein," 635—In Stream, 416—
 "Lady Pamela," 101—"Short-
 horn," 500—Tie, Improved, 542.
 Celery, New, A. 319
 Cellar, Above-ground of Bricks (3),
 875—Plans (2), 147.
 Cellar Bin, A. 381
 Charcoal Kiln. 107
 Chain Cattle Tie. 199
 Cherry, New, A—"Dougalls," 367
 Chest, Meal, A. 340
 Chicken Coop, Movable. 251
 Chicken Coops. 105

IMPORTANT INFORMATION FOR MANY CORRESPONDENTS.

With a view to a clear understanding on the part of our friends who kindly interest themselves in adding to our subscription list, we furnish the following information:—

1st. The price of a single subscription to the AMERICAN AGRICULTURIST is \$1.50 a year. Single numbers 15 cents.

2nd. The price of sample numbers is 6 cents, or three 2-cent stamps.

3rd. Subscriptions may begin with any number past, present, or future.

4th. We can usually furnish any number issued within 15 years at 15 cents each, or \$1.50 for 12 numbers.

5th. Subscribers desiring to complete their volumes for binding, may send their numbers to us, and we will supply missing numbers as above.

6th. The price of binding is 75 cents per year, in black cloth, gilt lettering, to which must be added 30 cents for return postage, making \$1.05 for all.

7th. The price of bound volumes is \$2.00 per year; postage, if sent by mail, 30 cents additional.

Premiums.—8th. Premiums (see Premium List) are given to the sender of new subscriptions, accompanied by \$1.50 for each name.

9th. Names for Premiums may be allowed to accumulate to the credit of the sender upon our Premium Ledger, until sufficient for any desired Premium.

10th. Every subscriber for 1885, who sends us \$1.50, together with 15 cents extra for packing and postage, is entitled to receive the NEW AMERICAN AGRICULTURIST FAMILY CYCLOPEDIA (700 pages, 1,000 illustrations), post-paid, provided he has not already received a premium on subscriptions for 1885.

11th. Subscribers whose subscriptions are already in whole or in part paid for 1885, may renew for 12 months beyond next expiration and receive the CYCLOPEDIA.

12th. No subscription upon which a premium has already been drawn, will be entitled to a CYCLOPEDIA, and no name upon which a CYCLOPEDIA has been forwarded will be counted towards any other Premium.

How to Send Money.—If possible, send by Money Order, Bank Draft, or Registered Letter. We accept the risk of money sent in any one of these ways.

Small sums may be sent by postal note, or in stamps, but at the risk of the sender.

Money in an unregistered letter is at the risk of the sender.

Silver in unregistered letters is liable to wear its way through the envelopes. On Foreign subscriptions, add 14 cents for extra postage.

Recapitulation.—Catalogue of Standard Publications free. Premium List sent on receipt of 4 cents in stamps. Rural Catalogue, beautifully illustrated, for 6 cents in stamps. Sportsman's Catalogue, richly illustrated, for 5 cents in stamps. Specimen numbers of the AMERICAN AGRICULTURIST, 6 cents in stamps. Back and Current numbers of AMERICAN AGRICULTURIST, 15 cents each.

AMERICAN AGRICULTURIST, per year,	-	-	-	-	\$1.50.
“ “ “ “ with Cyclopædia,	-	-	-	-	1.65.

Subscribers and others, working for Premiums, will bear in mind that the number of names designated in the Premium List for each article, is based upon the remittance of \$1.50 for the paper alone, **without** the Cyclopædia or other Premium to the Subscriber.

PUBLISHERS OF THE AMERICAN AGRICULTURIST.

MARVELLOUS CAREER OF THE AMERICAN AGRICULTURIST.

For forty-three years the *American Agriculturist* has been, as it is to-day, the recognized leading Agricultural Journal of the world. At times its regular paid circulation has approximated to one hundred and fifty thousand, and it has long been taken and read wherever the English and German languages are spoken. Twenty-four kindred journals in the United States have been absorbed by it. It has kept pace with the growth and development of the country, and at no period since its organization have the Company publishing the *American Agriculturist*, and the paper itself, been in a more prosperous condition than now.

A Great Premium List!

The most tasteful, attractive, practical and desirable Premium List ever prepared by us is sent to any address on receipt of two 2-cent stamps for mailing. It embraces about everything every member of every family wants—both useful and ornamental—selected with great care personally by the Publishers and Editors of this Journal, to meet the tastes and wants of its readers. All of the hundreds of these premiums can be secured without money, and with only a little labor. They are supplied to us at special prices by manufacturers, when not specially made for us, so that we are enabled to furnish them to our readers at very favorable rates. They are sold to, or made for us, at cheaper prices than for the regular trade, because of the public attention drawn to them, and their manufacturers, through the columns of the Premium List, which are printed by the hundred thousand. We are consequently able to supply them to our readers at correspondingly less prices. Never before was there such an opportunity presented for getting good things at good bargains. Several premiums, which have proved popular in past years, we again offer this year. Though a better quality of goods has been secured in many cases, we offer them at the same, or lower prices.

P. S.—It should be remembered that no name can in any case be counted for more than one premium. For example, the name of one who has already received the *American Agriculturist* Family Cyclopædia cannot be again counted towards another premium.

OUR FAMILY CYCLOPÆDIA.

HOW IT IS RECEIVED.

Everybody Surprised and Pleased with the Volume.

Below are samples of the kind of responses every mail brings us from subscribers who have received our FAMILY CYCLOPÆDIA, presented to all subscribers (old and new), to the *American Agriculturist* for 1885, who immediately send us the subscription price, and 15 cts. for mailing the CYCLOPÆDIA, making \$1.65 in all.

A Treasure for Every Family.

KEENE, N. H., Nov. 3, 1884.
Cyclopædia received. It seems to be a very valuable book that every family might possess. JOHN BOWKER.

LEBANON, Pa., Oct. 6, 1884.
Cyclopædia received: am delighted with it; it ought to be in every family and home. HENRY S. HEILMAN.

TAWAS CITY, Mich., Oct. 8, 1884.
The Cyclopædia received. My wife and daughter say it is excellent. J. M. WALKER.

BELL PORT, N. Y., Oct. 6, 1884.
Have this day received the Cyclopædia, and find it a very nice work. Think every family should try to obtain a copy. I. J. RAVEN.

ENFIELD, N. H., Oct. 17, 1884.
Cyclopædia received. Am very much pleased with it; think it will be a great help to my children. C. C. CHANDLER.

BIRMINGHAM, Conn., Oct. 7, 1884.
The Cyclopædia came safe yesterday, and it is certainly a very useful book for any family. I am well pleased with it. S. G. SCOTT.

WALKER, Pa., Oct. 20, 1884.
Cyclopædia received. Am much pleased with the work; it will be a welcome visitor to the homes of thousands. JAMES IRVIN.

WEST CHESTER, Pa., Oct. 6, 1884.
We are in receipt of the Cyclopædia, and are surprised at the careful and complete manner in which it is printed and compiled. It certainly will prove very useful in every home. HOOPES BRO. & THOMAS.

Surpasses all Expectations.

MOORE'S STORE, W. Va., Nov. 2, 1884.
Cyclopædia received, and am much surprised to find so valuable a volume given as a premium. D. J. ANDER.

IPSWICH, Mass., Nov. 3, 1884.
Cyclopædia received; thanks. It is more of a hook than I had expected. I think it will be very useful. NATHANIEL HILLS.

PROSPECT PLAINS, N. J., Oct. 21, 1884.
Cyclopædia received. Am more than pleased with it. ALBERT R. WALTERS.

DICKINSON, Dak., Oct. 17, 1884.
Cyclopædia received, and am much pleased with it. It is a better book than we looked for. L. W. GRANTIER.

CLIFFORD, Pa., Oct. 9, 1884.
Herewith I acknowledge receipt of Cyclopædia, and can only add that it is beyond my expectation. J. V. AYERS.

WOODBURY, N. J., Oct. 9, 1884.
I acknowledge receipt of the Cyclopædia. It is certainly very liberal in you to give away so much valuable information for so small an outlay. JNO. B. TWEELS.

ELLENVILLE, N. Y., Oct. 16, 1884.
Cyclopædia received. I am more than pleased with it. It is a marvel even in these times of cheap literature, but its value consists in its useful and instructive features. GEO. F. HEATH.

VALLEY STREAM, L. I., Oct. 9, 1884.
Much pleased with Cyclopædia, and please accept my thanks for it, and will further distribute those accompanying circulars that you mailed to me, in order to do justice unto my fellow beings. OLIVER H. CROMMELIN.

EQUINUNK, Pa., Oct. 12, 1884.
Cyclopædia received O. K. Thanks for same, and for prompt delivery. I am very much pleased with it. It is a great deal better than I expected. Will get some subscribers for you if possible. GEORGE BUDD.

PETERBOROUGH, Ont., Nov. 1, 1884.
Received Cyclopædia. I can assure you it is beyond my comprehension altogether, how you can supply so much for so little money. I expected to get a book in pamphlet form, but was agreeably surprised to receive instead a well bound book of over seven hundred pages. F. MASON.

An Agreeable Surprise.

HINGHAM, Mass., Oct. 8, 1884.
I have received the Cyclopædia, and would say, that I am agreeably surprised at the reception of such an attractive looking volume, for I did not suppose as a gift it could be any more pretentious than a pamphlet. HENRY W. CUSHING.

Law Firm of Larrabee & Lewis.
COUDERSPORT, Pa., Oct. 13, 1884.
Family Cyclopædia received. In completeness and value it far exceeds my expectations, and I do not understand how you can afford to give so valuable a premium for a single subscription to a periodical so well worth the subscription price. D. C. LARRABEE.

SOUTH WESTPORT, Mass., Oct. 31, 1884.
Cyclopædia received; accept our thanks. Surpasses anything I could have expected as a gift. It will prove a very useful book. Have been a subscriber to your publication seventeen years; have always been faithfully served and well pleased with it. MRS. WM. W. CLIFFORD.

AKRON, Ohio, Oct. 7, 1884.
Cyclopædia received, for which receive my heartfelt thanks. The hook is a better gift than I expected, the outside being neat and respectable; inside a mine of truthful knowledge. I shall try to persuade my neighbors to grasp the treasure. I am well pleased with it. J. B. BLOOMER.

LEWISTON, Me., Oct. 10, 1884.
Book came safely to hand: it is the best; just what I should expect from the *American Agriculturist*; myself and family are more than satisfied with it. I have bought many knives, razors and tools from Maher & Grosh (the firm who make the cutlery for our Premium List), and they have given the best satisfaction in every case. Gratefully yours, H. A. CHANNELL.

Meets a Long Felt Want.
MILROX, Pa., Oct. 20, 1884.
Received Cyclopædia safely. It supplies a long-felt want with many folks. H. P. SIGLER.

BAYPORT, N. Y., Oct. 14, 1884.
Many thanks for the Cyclopædia. I consider it a very valuable work; just the thing for every family in the land. B. D. OVERTON.

Full of Instruction.
PHILADELPHIA, Pa., Oct. 7, 1884.
Cyclopædia came to hand safe, many thanks; it appears to be a very complete book. Wishing you much success for the year 1885, etc., EDWARD KLINE.

MIDDLETOWN, N. J., Oct. 8, 1884.
Have examined the Family Cyclopædia with care and interest, and find it a book full of instruction, and invaluable to not only the farmer, but to every one, whatever their calling or station in life. While the *American Agriculturist* is a treasure to any farmer and family, and cheap without any premium, this useful hook added to it ought, and I think will, call forth the gratitude and thanks of every subscriber. Yours, with thanks, A subscriber for seventeen years. GAR. A. LUTSTER.

Perfectly Satisfactory.
WAVERLY, Md., Oct. 14, 1884.
Family Cyclopædia, and October number of the *American Agriculturist* received, and all satisfactory. Have distributed the circulars. J. S. NETTLETON.

BELLWOOD, Pa., Oct. 8, 1884.
Cyclopædia received, and is all I expected; am satisfied with it, as I have been with the *Agriculturist* for these many years. JAS. LOWTHER.

Worth More than the Price of the Paper.
NEW KINGSTON, N. Y., Oct. 16, 1884.
Cyclopædia received. I think it is worth more than the price of the paper for one year. WALTER F. COULTER.

ODEBOTT, Iowa, Oct. 8, 1884.
Received the Cyclopædia. It is the very thing I was looking for. I am well satisfied with it; it is a finer book than I expected. HERMAN FROST.

Model Book of Reference.
INDIANA, Pa., Oct. 7, 1884.
Am well pleased with the Cyclopædia, and think it a model book of reference. JACOB A. HILE.

EAST ORANGE, N. J., Oct. 11, 1884.
Received the Cyclopædia; think it will be useful as a book of reference. MINNIE BALDWIN.

DAYTON, Ohio, Oct. 9, 1884.
Family Cyclopædia received. It will be a very convenient reference book. Very truly, J. McLAIN SMITH.

Superb and Invaluable.
GREIGSVILLE, N. Y., Oct. 31, 1884.
The *Agriculturist* maintains its rank in full, and the Cyclopædia is superb and invaluable. FRANK RIOE.

BLOOMSBURG, Pa., Nov. 1, 1884.
Cyclopædia received. It is just what I have needed as a book of reference. WM. BEERS.

SLATERSVILLE, R. I., Oct. 17, 1884.
Cyclopædia received, and would say that it is a condensed work of much information, and of great value. OLIVER A. KELLY.

NEWTON LOWER FALLS, Mass., Oct. 14, 1884.
Cyclopædia received in good condition. Please accept thanks. Very satisfactory. Hope to see the paper soon. I have taken it before, and it is a great help to me in cultivating. ELLEN F. WISWALL.

VINELAND, N. J., Oct. 10, 1884.
Cyclopædia is received, and after nearly one hour's examination by each one giving out a word to be found, and a careful look through myself, I can say I am perfectly satisfied with it. After giving it another look through, I shall start it around among my friends and neighbors, with the hope that it may benefit you. Thanks. I. F. SINGERS.

A Gem.
NEW YORK, Oct. 15, 1884.
Mr. Samuel Simpson, head of the great Plated Ware firm of Simpson, Hall, Miller & Co., rated at six hundred thousand dollars, writes us as follows: WALLINGFORD, Conn., Oct. 14, 1884.

My brother, George Simpson, farmer, has received your *American Agriculturist* and Family Cyclopædia, and is much pleased, and while I have Appleton's, and Johnson's, and some other Cyclopædias, yet some of my family have seen that sent to my brother, and think it a gem. I therefore enclose the sum of \$1.65, for which please send me your *American Agriculturist* and Cyclopædia, agreeable to your advertisement, and oblige, Yours, respectfully, SAMUEL SIMPSON.

P. S.—Two of my friends desire me to send an order for them also; I, therefore enclose, etc.

A Very Handy Book.
COXSACKIE, N. Y., Oct. 7, 1884.
A very handy book of reference, for its biographical features particularly. R. H. VANBERGEN.

DOBBS FERRY, N. Y., Oct. 7, 1884.
The Cyclopædia has come to hand all safe. A very handy hook to have in the house. JOHN DUTCHER.

WEST NORWALK, Conn., Oct. 18, 1884.
Cyclopædia received. Am much pleased with it; think it would be useful in every family. W. H. HITCHCOCK.

SOMERVILLE, N. J., Oct. 6, 1884.
Received your Cyclopædia this morning; many thanks for the same. I think it will be very handy and instructive. THEODORE F. CORNELL.

NORWALK, Conn., Oct. 16, 1884.
We received the *Agriculturist* and the Cyclopædia, with which we are pleased. Accept our thanks. C. F. CORNWALL.

MONTMAONY, Canada, Oct. 16, 1884.
Received your Cyclopædia; it is a very good hook, and of undeniable usefulness. Your Journal, the *American Agriculturist*, is always of the greatest interest and help, accordingly I am going to recommend it heartily to my friends. L. H. BLAIS.

The * American * Agriculturist * Family * Cyclopædia. *

A Book of Reference for the Various Departments of Human Knowledge.

Including Agriculture, Astronomy, Architecture, The Various Arts and Sciences: Biography, Botany, Chemistry, Engineering, Geography, Geology, History, Horticulture, Literature, Mechanics, Medicine, Physiology, Natural History, Mythology, and many other departments.

700 PAGES AND OVER 1,000 ENGRAVINGS.

CONDENSED, COMPILED, AND ARRANGED FOR CONVENIENT USE.

SPECIMEN PAGES, SHOWING SIZE OF PAGE, STYLE OF TYPE AND ILLUSTRATIONS.

DIRK

267

DISCOPHORA

FRICITION-BALLS

352

FRINGE

Dirk, derk. A dagger formerly much used in the Highlands of Scotland, and still worn as essential to complete the Highland costume.

Dirt-eating, dert'et-ing. Cachexia Africana, a disorder of the nutritive functions among negroes, and in certain kinds of disturbance of the feminine health, in which there is an irresistible desire to eat dirt. The practice of some tribes of S. America, of using certain kinds of clay for food.

Discharger, dis-chärj'er. In Elect. an instrument for discharging a Leyden jar, &c., by making a connection between the two surfaces. In calico printing, a discharge.

Discharge-valve, valv. In steam-engine, a valve which covers the top of the barrel of the air-pump and opens upward.

Discharging Arch, 'ing arch. An arch formed in the substance of a wall to

Dirk.

Leyden Jar with Discharger.

Discharging Arch

relieve the part which is below it from the superincumbent weight, commonly used over lintels and flat-headed openings.

Discipline, 'plin. Education; instruction; training. Rule of government. Subjection to rule. Correction; punishment inflicted by way of correction and training: instruction by means of misfortune and the like. In the R. C. Ch. bodily punishment inflicted on a delinquent; or that external mortification which a pen-

itent inflicts on himself. The scourge a delinquent uses in self-chastisement; or that yielded by his confessor. Books of discipline, two books drawn up for the reformation of the Scotch Church—the first by Knox and four other ministers in 1560, the second by a committee of Assembly of 1578, in which Andrew Melville took a leading part. This is still appealed to as the most complete and authoritative exhibition of Scottish Presbyterianism.

Dischidia, kid'ia. A gen. of Asclepiadaceæ, herbs or under shrubs. One species, *D. Rafflesiana*, is remarkable for its numerous pitcher-like appendages.

Disciples of Christ (Campbellites). An independent sect holding views substantially identical with the Baptists, founded in the U. S., 1809, by Rev. Thomas Campbell, a distinguished preacher of the Presbyterian church, from which he seceded, and his son, Rev. Alexander Campbell, both natives of Ireland. The sect numbers nearly three-quarters of a million communicants, most of them being in the S. and W. States.

Discobolus, kob'o-lus. In Class. Antiq. a thrower of the discus or quoit; a quoit-player. The name given by Cuvier to his 3d family of soft-finned teleostean fishes. The lumpfish (*Cyclopterus Lumpus*) is a good example of the group.

Discophora, ko'ô-ra. A sub-class of the Hydrozoa, comprising most of the organisms known as sea-jellies, jelly-fishes or sea-nettles. A name sometimes given to the order of annelids, Hirudinea, to which the leech belongs.

Discobolus throwing the Discus.

Friction-balls, balz. Balls placed under a heavy object to reduce the friction, while that object is moving horizontally. Some swing-bridges have such balls placed under them.

Friction-clutch, kluch. A species of loose coupling much used for connecting machines which require to be frequently engaged and disengaged, or which are subject to sudden variations of resistance.

Friction-cones, kônz. In Mach. a form of slip-coupling, which allows the cones to slip on any extreme pressure being applied.

Friction-coupling, kup'ling. A form of coupling in which two shafts are connected by friction, as in the friction-clutch and friction-cones.

Friction-powder, pou-der. A composition of chlorate of potash and antimony, which readily ignites by friction.

Friday, fri'dä. The 6th day of the week. Good F., the Friday immediately preceding Easter; which is kept sacred, in memory of the sufferings and death of Christ, as it is believed to be the anniversary of the day on which he was crucified.

Friedland, frêd'lahnt. A town of E. Prussia, 36 m. S. E. of Königsberg, noted for the great victory, June 14, 1807, of the French under Napoleon I. over the allied Russian and Prussian armies, resulting in the treaty of Tilsit.

Friendly Islands (Tonga). An archipelago of the S. Pacific, of which Tongatoo is the chief island; pop. abt. 25,000.

Friend, frend. One of the Society of Dissenters, which took its rise in England about the middle of the 17th century, through the preaching of George Fox.

Frieze, frîz. In Arch. that part of the entablature of a column which is between the architrave and cornice. It is a flat member or face, usually sculptured. A coarse woolen cloth having a shaggy nap on one side, extensively manufactured in Ireland.

Frieze-panel, pan-el. One of the upper panels of a door of six panels.

Friga, frig'a. In Scand. Myth. the wife

of Odin, a goddess corresponding in some respects to the Aphrodite of the Greeks and Venus of the Romans. Called also Freya.

Frigate, fri'gät. A war vessel larger than a sloop or brig, and less than a ship of the line; usually carrying thirty to sixty guns, on the main deck and on a raised quarter-deck and fore-castle, or having two decks. Since the introduction of iron-clad war vessels the term has been applied to those having a high speed and great fighting power. Double-banked frigates, such as carried guns on two decks and had a flush upper-deck. Steam frigates, large steamships carrying guns on a flush upper-deck, and having a tier also on the lower deck.

Frigate.

Frigate-bird, berd. The name given to a gen. of tropical birds (*Tachypetes*), pelican fam. (*Pelicanidae*), and allied to the cormorants; a man-of-war bird.

Frigate-bird.

Frigid Zone, frîj'id. A space about either pole of the earth, terminated by a parallel of 66° of latitude, known as the polar circles. At the pole the sun is visible for half the year and invisible to the other half.

Frimaire, frî-mär. The 8d month of the French republican calendar, dating from September 22, 1792. It commenced November 21, and ended December 20.

Fringe, frinj. An ornamental appendage to the borders of garments or furniture, consisting of loose threads. The use of fringes is of very great antiquity, as shown by the dresses of figures on the ancient

Assyrian Fringes.

A Remarkable Storehouse, and Work of Reference, for Almost Every Department of Human Knowledge.

This is an entirely new book, compiled by competent Editors, in consultation with the best authorities. It contains over 700 pages, and is printed from entirely new plates, and the type is large and clear. This Cyclopædia is a Treasury of Knowledge, and will be found of the greatest use in answering the ten thousand questions that constantly arise, in regard to dates, places, persons, incidents, statistics, etc., etc.

What the Cyclopædia Contains.

The various Arts, Trades, and Sciences, of necessity make use of technical terms, and these are so little used outside of those special branches, that ordinary Dictionaries omit a large share of them. Among the technical terms explained will be found those belonging to

Agriculture. **Astronomy.**
Architecture. **Botany.**
Chemistry. **Engineering.**
Geography. **Geology.**
Horticulture. **Mechanics.**
Medicine. **Physiology.**
Natural History. **Mythology.**
And Numerous Other Arts and Sciences.

Among other topics upon which it is very full are: **Biography**, including eminent living persons. **History**, **Literature**, and others, in nearly all the various Departments of **Human Knowledge**.

Over 1000 Engravings. On account of the size of the pages, the engravings are necessarily small, but they are wonderfully clear, and selected with a view to illustrating the subject rather than to make a show.

When we consider the vast number of topics, the judgment exercised in their selection, the conciseness with which they are treated, and the copiousness with which they are illustrated, **The American Agriculturist Family Cyclopædia** is a remarkable book.

Every one who reads, should, when he meets with a word that is new to him, or one the meaning of which he does not understand, at once look up the word in a dictionary or elsewhere. But the definitions of the dictionary in many cases are found to be meagre, and the meaning must be sought in some more comprehensive work of reference. Comparatively few can afford to possess one of the standard Cyclopædias, in many volumes.

Consequently the publishers of the *American Agriculturist* have been on the lookout for some volume sup-

plementing the Dictionary, some **multum in parvo**, which they might present to all of their readers, old and new. They now have it in this entirely new Cyclopædia, which is now ready for delivery.

PRESENT EXTRAORDINARY.

To every Subscriber (new or old), to the *American Agriculturist* for 1885, at \$1.50, whose subscription is forwarded us before Jan. 1, '85, we will present this Cyclopædia at our office.

Or we will mail it to any subscriber in the United States or Provinces, on receipt of 15 cents additional for packing and postage, making \$1.65 in all.

AMERICAN AGRICULTURIST

FOR THE
FARM · GARDEN · & · HOUSEHOLD

"AGRICULTURE IS THE MOST HEALTHFUL, MOST USEFUL, AND MOST NOBLE EMPLOYMENT OF MAN."—WASHINGTON.

VOLUME XLIII.—No. 1.

NEW YORK, JANUARY, 1884.

NEW SERIES—No. 444.

THE FIRST SNOW STORM.

Drawn and Engraved for the American Agriculturist.

Contents of This Number

[Articles marked with a star (*) are illustrated; the figure with the star indicates the number of illustrations.]

Abutilon, The Snowball.....	23
Apples, Keeping in Winter.....	23
Barn Floorings.....	13
Barn, Plan of a Small.....	4
Barrow for Drying Bedding.....	12
Beef, Elevating a Slaughtered.....	5
Blackberries, Two New.....	22
Boots, Mending Rubber, and Shoes.....	8
BOYS' AND GIRLS' COLUMNS:	
A Western Boy's Adventure.....	26
Games for Winter Evenings.....	27
The Mangrove Tree.....	27
Do Deer Shed their Horns Annually?.....	23
How Our Eyes Sometimes Deceive Us.....	23
Going! Going! Gone!.....	23
Hunger the Best Cook.....	23
About Scorpions.....	23
Head, Bodies and Legs.....	23
Butchering, Home.....	16
Cattle, Preventing from Browsing.....	11
"Cattle Pull," The.....	8
Carp as a Food Fish.....	11
Cellars, Above Ground.....	11

Work, Farm, for the Month.....	2
Work in Horticultural Department.....	3

For Humbug exposures, book reviews, business announcements, etc., see the last pages of the paper.

Wanted.

100,000 men, women and children to canvass for the *American Agriculturist*. Special inducements are offered in the way of valuable Premiums. Furthermore, those who wish to make a business of canvassing will please immediately address us for particulars regarding special offers.

New Features for the New Year.

We have completed arrangements for new departments, and new writers, which will make the *American Agriculturist* in the future more valuable and interesting, if possible, than ever before. During the coming year, agricultural inventions, plans for farm buildings, and the best regions to migrate to in the West, will receive special attention. The Household and Children's Departments are to be rendered more interesting with fresh contributors, while the schemes for duping and defrauding unsuspecting farmers and others, are to be thoroughly exposed.

Why Given?

A subscriber in Kansas wishes to know why old subscribers do not receive Premiums the same as new ones. If he will study our offers more closely, he will discover that premiums are given to old subscribers, as a reward for their efforts in behalf of the *American Agriculturist*. Our object in giving Special Premiums, is to increase the circulation of the paper. We do not give any premiums because the journal is not worth far more than the subscription price. Every year we expect to, and are willing to expend tens of thousands of dollars in this manner, in making known, and extending the circulation of the paper. We were, if we mistake not, the first publishers in the United States, to systematically reward the friends and workers of a paper, by means of Premiums. The policy so successfully carried out in the past, we propose to adhere to in the future.

Our Premium Picture.

The warmest encomiums are everywhere pronounced upon the elegant Engraving, "Foes or Friends?" Remember it is furnished free at this office to every subscriber, new and old, or mailed to any address on receipt of ten cents to pay for packing, postage, etc.

The Premium Dictionary.

Our Premium Dictionary, given to every sender of a new subscriber, has proved so satisfactory that we have completed arrangements for furnishing 50,000 more of them, as called for. The offer of this Dictionary stands alone by itself. Every sender of a new subscriber at the regular rate of \$1.50 a year will receive the Dictionary free at this office, or it will be mailed to such sender on the receipt of ten cents for postage.

Special Premiums.

See page 43 for descriptions of new and special Premiums which we present to those who procure and forward us Subscriptions. They are in every way most desirable.

Premium List.

We have now printed **50,000** more copies of the beautiful 32-page Premium List for the benefit, among others, of those subscribers who may have lost or mislaid the one received in October. If every such subscriber will forward his name on a postal card, he will receive a second copy.

What is thought of the American Agriculturist.

See page 42 for expressions of opinion from old and new subscribers, regarding the *American Agriculturist*.

Live Stock Notes.

Horses.—Regularity in feeding is more important than is usually appreciated, with horses as well as with milk-producing cows. Wholesome food and sufficient quantity at stated times is essential to healthful growth and efficient service. The amount of rations is governed by the age of the animal and whether at work or idle. No rule in pounds and ounces of hay and grain can be laid down for any horse, and the one in charge needs good judgment to keep the horses in a strong and healthy condition. A knowledge of the requirements of a locomotive would help many horse owners to a better understanding of the laws of feeding. The amount of coal, water, etc., depend upon the easy movement of every part of the engine, and upon the work being done. The horse is an engine, and, more than that, because it is a living creature and has additional wants. Plenty of food and water are only a part of the needs of a horse. There should be a comfortable stable and all those little attentions which add so much to the health of the animal. Good grooming is essential to good digestion. Cleanliness of the skin is as necessary for the health of a horse as for that of a man. The irritation of the brushing stimulates the healthful functions of the skin; but the brushing may be too severe. There is strong objection to the use of a harsh curry comb. If a good stiff brush is used daily there will be no use for a wire-toothed comb or other harsh implement. The rubbing of the "running gear" of a horse is as essential as that of an engine.

Cows.—Milch cows are generally doing double work at this season, and should be fed and cared for accordingly. It is folly to milk a cow up to within a few days of calving; it is running the animal machine at a reckless speed, and a break will come somewhere. Highly fed cows require a reduction of the rations as the period of calving approaches. This is especially true of high bred animals which are more or less pampered. The young stock, when infested with lice, should have a mixture of equal parts of sweet oil and kerosene rubbed thoroughly upon the surface of the skin.

Sheep.—When lambs are dropped this month almost constant care will be required for a few days, especially if the weather is very cold. It is often best to wrap a chilled lamb in a woollen blanket, and even to remove it to the house for artificial warmth by the fire, and to stimulate it with a little hot ginger tea. A few extra early lambs bring more in the spring market than several times the number of late ones. The breeding ewes should be by themselves in warm quarters. The rest of the flock need comfortable sheds and yards, with good hay, straw and grain, fed regularly with enough litter to keep the floors dry, especially the part which the flock uses for sleeping.

Swine intended for pork are now mainly disposed of, or should be. The store pigs need only moderate feeding and clean warm pens. Provide now for young pigs in May, the most favorable time for them, as the weather is warm and green food

abundant. If possible use a pure-bred boar. As a rule it is not the most profitable to raise pure-bred swine for the pork barrel or for the market either.

Poultry.—Unless the house be warm and the food wholesome and abundant, the hens will furnish very few eggs. The birds enjoy the winter sunshine.

Work in the Horticultural Departments.

A Word to Farmers.—That for cultivators "Summer is the time for work; winter the time for reading and thought," is none the less true because said many times before. When an author says: "There are no acres which the farmer can cultivate with so much profit as those within the boundaries of his brain," it is a striking way of stating it, but it means the same old story, "Now that you have leisure, read and think." It may be asked: "What shall we think about?" We address these notes to farmers rather than to horticulturists. The first point for every farmer in the older parts of the country to settle is this: Am I making the most of my land? It is an accepted fact that those near cities and large manufacturing towns cannot afford to raise ordinary farm crops. All the centres of dense population afford markets for other produce than corn, wheat, oats, etc., and it is the interest of every farmer in such localities to ask and ascertain how he can turn his acres to the greatest profit? These winter months should allow abundant time for answering the question, What shall I grow? There are three principal kinds of culture that may be undertaken by farmers who find a change desirable. Orcharding, small fruit growing, and the raising of vegetables or farm gardening. Each of these, especially the last two, afford products that meet with a ready sale wherever a large population is concentrated. If orcharding is decided upon, let the trees, whether apples, pears, peaches, etc., be of the early varieties, and those kinds in demand which cannot be transported from long distances. If small fruits are to be grown, study up the subject, and select varieties that will cover the whole season. If vegetable raising, usually the easiest for most farmers, ascertain the demands of the market, and arrange to meet them. There is nothing about either of these cultures that cannot be mastered by any farmer of fair intelligence. It is safe to say that by devoting his land to either, he can, after deducting all extra expenses, more than double the return per acre than he can get from any of the farm crops proper. Every farmer near a market should take up this matter seriously, and be ready to make the best use of the advantages of his location. The books and periodicals in each department afford a sufficient guide to those who would take a new departure.

Orchard and Nursery.

The First Duty Here is to take care of what we have. See that fences and gates are secure. In those unfortunate localities where animals are "free commoners"—allowed to run in the road, these half-starved four-legged tramps will take advantage of deep snows and go over an ordinary fence to browse upon the twigs of an orchard.

Rabbits and Mice will continue to do mischief. When the snow is deep and has a slight crust, rabbits can reach the lower branches of trees and prune them after a "system" not given in the books. Traps and shot guns will convert a nuisance into a savory dinner. Rubbing the trunks of young trees with fresh meat or smearing them with blood will keep off rabbits. Pack the snow while light around the base of the trees, to repel mice.

Fruit in the Cellar of the dwelling.—Open the windows whenever there is no danger of freezing. The ventilation is important to the inmates, and low temperature prolongs the keeping of the fruit.

Planting next Spring.—If fruit trees are to be set out next spring, much of the work may be done now—upon paper; make a plan of the orchard, select the varieties and indicate the place for each. In choosing fruit for market, have but few kinds.

Root-Grafting in nurseries is carried on now, the stocks and scions being placed under cover last fall.

The Fruit Garden.

A Great Mistake is made by growers of small fruits who send all their produce to New York or other city markets, ignoring the local markets, which as a rule pay much the best.

Preparation for Planting.—The whole subject should be thoroughly considered and selections made, recollecting that choice varieties for home use, are not always the most profitable for market.

Every Farmer, whether he markets fruit or not, should have an abundant supply of small fruits, all that the family, no matter how large, can eat, from the earliest strawberry to the last grape. Not only will they conduce to health, but will greatly help to make farm life acceptable to young people. The cost for a start need not be large, and when one has a few plants they may be readily increased.

Kitchen and Market Garden.

Though the season prevents outside work with most of our readers, there is no month when something may not be done to save time in spring.

A Gardener's Faith in the return of "seed-time and harvest," is shown by the large amount of labor and expense he puts forth; before results can be secured. His work is largely one of preparation. Much can be done now to save time in the busy days of spring. The successful gardeners are those whose preparatory work is most complete. The most important work of the garden at this season is:

The Accumulation of Manure.—Manure is, "first, last, and all the time," the foundation of profitable gardening. While all else is dormant, the heap of fertilizing material should be growing. All home sources should be made the most of. Horses should, if possible, be bedded with leaves, for the sake of the manure pile. If cattle are fed on corn fodder, by all means cut it, if not for the good of the animals, at least for that of the manure. Arrange to have the chamber slops, and all kitchen refuse not needed by pigs or poultry, go to the pile.

The Poultry House is an important source of manure. It should be cleaned at least once a week. If the fowls are numerous and the room small, a daily cleaning will pay in the benefit to the fowls. The droppings may be added to the manure heap, or kept separate in a dry place for special crops.

Manure from Outside must usually be purchased by market gardeners. It is well to contract for the year with livery stables and others. Whenever a load of "truck" goes to market, the wagon should bring back a load of manure of some kind.

Fertilizing Materials, other than from the stable, are to be had in all large towns. Where there is a brewery, the spent hops, regarded as valuable as stable manure, should be secured. The refuse of tanneries and slaughterhouses will make a valuable addition to the heap. Wherever there are manufacturers of horn, bone, or whalebone, secure the refuse and look into the value of other wastes.

The Manure Pile should be so large that it can not get chilled through. When it becomes hot, it must be turned to prevent burning or "fire-fanging." Build up the heap anew, breaking up all lumps, and in such a manner that the outside portions will be on the inside of the new heap.

Other Preparatory Matters.—Overhaul and repair the tools and implements, and have duplicates of parts liable to wear out or break, such as plow points, cultivator teeth, etc. If more sashes are needed for hot-beds, purchase them in ample time.

Home-Made Appliances.—Markers of various sizes should be made. A good wooden reel for the garden line, is better than the poor iron ones usually sold. Make a stock of window boxes for sowing seeds in the house, and provide a stock of flats, etc.

Flats or Shallow Boxes, are much used for sowing seeds to be started in hot-beds, and in which to transplant young seedlings. Starch, soap, and other boxes from the store, can be bought very cheap, and each will make, when cut apart, three or two flats, according to the depth of the box. Three inches is amply deep enough for the flats, and for a number of uses, two inches is sufficient.

Soil for Hot-Beds.—If a supply has not been secured, take advantage of the first thaw, and place an ample stock of rich, light soil in the cellar, or under some shelter where it will not freeze.

Hot-Beds.—For the majority of plants, these should be ready and the seeds sown, six weeks before the plants can be set out in the garden. In the warmer States they will be wanted this month.

Seeds.—Watch advertisements, and send for catalogues, and as soon as they are at hand, decide what seeds must be purchased, and order at once. There is an advantage in this to buyer and seller.

Care of Stored Crops.—Besides preparing for next season's work, it is necessary to care for the stored crops. These are chiefly roots and celery. If roots are, unfortunately, stored in the house cellar, keep its temperature down to thirty-four degrees. Use a thermometer, and when it shows that the temperature is too high, open the windows.

Roots and Celery in Trenches.—Storing roots, etc., in trenches, divided by earth partitions into pits of a few bushels each, is preferable to storing in the cellar. When cold weather sets in, these need a final covering of eighteen inches or two feet of soil, rounded up so as to shed water. In many localities this is not needed before the present month. Celery, if covered too soon, will heat and decay. Leaves, straw, or marsh hay, are used for the covering, which should be slight at first, and finally a foot or more thick. We usually lay boards roof-wise over this covering, to facilitate getting out the celery, when the trenches are covered with snow.

Flower Garden and Lawn.

Little can be done here just now. If snow lodges in evergreen trees, shake it out at once, before it gets icy, or the branches may be broken, as the lower ones are especially liable to be, by the settling of heavy snow upon them. This may need shovelling away.... When snow hides the roads and walks, unless they are marked by wires stretched on stakes, people will drive or walk a straight line for the house, and thus often injure small shrubs on the lawn. This may still be done during a thaw.... In mild spells, shrubs may be pruned. Some of them produce their flowers from buds formed last summer, and others upon the growth of the current season. They had better go unpruned, than to allow one not understanding this, to work upon them. While the latter kind may be cut back severely, the others only need judicious thinning.

Green-house and Window Garden.

Bulbs potted last fall may be brought, a few pots at a time, to the window or green-house, and given water, gradually at first, and more as the leaves increase. When the flowers fade, cut them away, but keep the leaves in a growing state until they also begin to fade. Then cut away these and take the pots to the cellar. In spring plant the bulbs in the open ground, where they will flower, but not so finely as at first.... Water plants in pots as they seem to need it. It is better to allow them to suffer a little and show that they require water, than to water all alike daily. If this be done the soil in the pot will be in the condition of mud, and the plant grow sickly and die.... Dust is a great enemy to house plants. Contrive a screen of light fabric to cover them when the room is swept. Plants with thick, smooth leaves should have them washed weekly, using a sponge or soft cloth. Others may be showered, first setting the pots in a bath-tub or sink.... Insects in the green-house are for the most part kept under by a weekly fumigation with tobacco-smoke. House plants may be treated with tobacco water, to be followed after an hour by a showering of pure water. Remove scale insects and mealy bugs by hand; it is the best remedy.... When chrysanthemums cease blooming cut the stems away and remove the pots to the cellar.... A green-house is, of course, provided with means of ventilation, which should be employed judiciously, according to the outside temperature. House plants often suffer for want of fresh air. Letting down the windows at the top, in the middle of the day, will greatly benefit the plants.

Plans and Description of a Small Barn.

BY "BURR OAK."

For general dimensions see drawings, and for timber, etc., see estimates below. The foundation

lined plank. All the doors are made of inch dressed and matched flooring six inches wide. The floors over horse and cow stables are eight-inch matched boards. The outside covering of inch stock boards twelve inches wide, dressed and battened. The cornice of the main building projecting about

Home-Made Incubators.

Several subscribers who have read the recent articles in the *American Agriculturist* on this subject, wish to know what success has been obtained, especially in using the machines, packing in sawdust, etc.

Mr. "C. E. M.," Fall River, Mass., asks for the dimensions of all the parts of a machine to hold seven hundred eggs, best mode of ventilation—in short, all details for constructing a successful incubator. Most of these inquiries are answered in the following from P. H. Jacobs, author of the article in our June, 1883, number, which called out the above requests:—Nearly all the makers of incubators have testimonials in proof of their efficiency, and some of them are excellent. The inquiries now are about those "home-made." Two methods of construction were adopted for the trials; several made by the operators and heated by lamps, hatched well. The average percentage of chickens may be safely stated at sixty per cent. One gentleman secured over eighty per cent from three

Fig. 1.—FRONT ELEVATION OF BARN.

Fig. 2.—SIDE ELEVATION OF BARN.

walls are started in a trench below frost and laid in mortar above the grade, eighteen inches high by eighteen inches thick, faced and pointed, with the sills imbedded and suitable openings left in the walls for ventilation. The horse stable is nine

twenty-eight inches, is finished in good style with neat crown moulding. Ends of rafters cut to pattern as shown (fig. 7). Outlookers are cut in the same style in the gables. The roof is covered with the best quality of shingles. Cupola as shown on elevations, made thoroughly water-tight around its base. Rafters doubled and made four by six inches under cupola.

Incubators, with about one thousand two hundred eggs, one thousand chicks being hatched. One incubator, which was operated by drawing off cold water from a tank daily, and replacing it with heated water, gave fifty per cent. In every case the operators were novices. The secret of success is in the storage of heat by the sawdust packing which, when fully warmed, gives off the heat very slowly, thus preventing

Fig. 3.—GROUND PLAN OF THE BARN.

feet high between timbers; its floor of two-inch plank laid with three-inch slope, the planks doubled in the stalls. It is fitted up with mangers, feed boxes, harness-room, etc., as shown. The cow stable is eight feet high between timbers; floor of two-inch

be first-class of its kind, and the entire building to be thoroughly and completely finished, as specified.

Total Cost.....	\$945.00

In giving the estimates of cost, the prices for building materials are those of the large markets. They will vary somewhat in different localities.

Fig. 5.—STABLE SIDE OF DRIVEWAY.

sudden changes of temperature. The thicker the packing of sawdust, the longer the retention of heat, but of course this increases the dimensions of the incubator without corresponding increase of capacity. The hot-water incubator is the safest, as no lamps are used. To hold one hundred eggs, the tank should be eighteen inches wide and thirty inches long, and the depth not less than twelve inches, as the deeper it is the greater the volume of

Fig. 6.—SECTION OF HORSE STABLE.

water, and the longer will the heat be retained. The tank is larger than the drawer, as the former rests on supports, while the drawer slides in and out under it. The ventilator and drawer are of the same dimensions (making allowance for the

Fig. 4.—BAY SIDE OF DRIVEWAY.

plank sloping one and one-half inch back to the drop. It is fitted with stanchions (fig. 8), manger, etc., as shown. The driveway floor is of two-inch plank dressed and matched, or square edged and

packing), and would therefore be an inch all around less than the tank, or sixteen by twenty-eight. Every two inches added to the length of the tank gives room for another row of eggs. The largest incubators used in Hammon on are three feet wide and four feet long, the capacity being a little over three hundred eggs. To hold seven hundred eggs, the drawer should be about four feet wide and six

Fig. 7.—SECTION OF COW STABLE.

feet long. The incubators are ventilated by pure air passing under the bottom, then through tin tubes just under the egg drawer, while the heat is radiated upon the eggs from the tank above. The illustrations in the June *American Agriculturist* convey a very good idea of the tank incubator, accompanied by descriptions of the several parts. This

Fig. 8. THE STANCHIONS.

brief statement being a reply to special inquiries, those who have not read the June descriptions should do so. Many suppose that incubators require but little care, and numerous mistakes are the result. To hatch successfully, any operator should be willing to devote as much time and labor to the management of incubators as he would to other important painstaking enterprises that are expected to be profitable.

The Public Domain.

H. A. DAIGH.

The "National Domain" embraces all the territory under the domain, jurisdiction, or government of the United States, including main-land, islands and water. By the last census this amounts (exclusive of Alaska) to 3,025,600 square miles, made up of 2,970,000 square miles of land and 55,600 square miles of water in its lakes, rivers, bays, etc.—or 1,900,800,000 acres of land. Alaska is not yet surveyed, but is roughly estimated at 577,390 square miles, which, added to the rest of the country, makes the total "National Domain" 3,602,990 square miles. Allowing same proportion for Alaska (536,780 land, 10,610 water) we have in our National Domain 66,210 square miles of water area, and 3,536,730 of land, or 2,263,539,200 acres, enough to supply 160 acres, such as it is, to each of fourteen and one-seventh million persons.

The term "Public Domain" applies especially to lands owned in fee by the Government, with full right to dispose of them. Since its foundation the Government has owned nearly 3,000,000 square miles, or nearly 2,000,000,000 acres of land (2,894,235 square miles—1,852,310,400 acres). Of this a little over one-third, or 630,000,000 acres, have been disposed of up to the last census, including 100,000,000 acres pledged to the railroads. So we see that Uncle Sam has still quite a good deal of land including swamp waste, etc. [About 45,000,000 acres were parted with up to July, 1883, since the census report of 1880.—ED.]

How ACQUIRED.—The lands constituting the public domain were acquired by treaty, by cession

from States, and by purchase. All lands in the United States formerly belonging to Great Britain passed to our Government by the treaty of peace concluding the Revolutionary War. Large tracts claimed by certain of the States were ceded by them to the General Government. The territory so acquired embraced the present States of Ohio, Indiana, Illinois, Michigan, Wisconsin, and part of Minnesota, Alabama and Mississippi. They were held by Massachusetts, Connecticut, New York, Virginia, the Carolinas and Georgia under British grants. Lands have since been purchased from France, Spain, Mexico, Texas and Russia.

ITS COST.—No price was paid for the lands acquired from Great Britain or ceded by the States. The purchase from France was made in 1803, under President Jefferson. Napoleon Bonaparte, who was then First Consul, acted for the French Republic. This purchase embraced all of Louisiana, Arkansas, Missouri, Iowa, Nebraska, Kansas, Oregon, Dakota, Montana, Idaho, Washington and Indian Territories, and a part of Alabama, Mississippi and Minnesota. The cost was \$15,000,000, besides certain liabilities assumed by the United States, which ultimately brought the cost up to over \$27,000,000. This sum seemed at that time a very large one; but as the tract contained 757,000,000 acres, the cost was only a trifle over 3½ cents per acre! Florida was purchased from Spain in 1819, in Jefferson's administration, for \$5,000,000, paid in bonds on which about \$1,500,000 of interest accrued before their maturity; so that the cost was really about \$6,500,000, or 17½ cents per acre, as it contained about 38,000,000 acres. There were two purchases from Mexico; one in 1848 under President Polk, and another in 1853 under President Pierce. The first included California, Nevada, Utah, and part of Arizona, New Mexico and Colorado. It contained in round numbers 334,500,000 acres, and cost \$15,000,000, or 4½ cents per acre. The last, known as the "Gadsden purchase," included a strip of land called the Mesilla Valley, lying in the present territories of Arizona and New Mexico, on their southern boundaries. It contained 29,000,000 acres, and cost \$10,000,000, or 34½ cents per acre.

The purchase from Texas was made in 1850, under President Fillmore. It included about 65,000,000 acres lying in Kansas, Colorado and New Mexico, and cost \$16,000,000, or 24½ cents per acre.

The purchase of Alaska from Russia was at the lowest price per acre of any land that Uncle Sam has bought. It included about 370,000,000 acres, and cost \$7,200,000, not quite 2 cents per acre, or only 1½ cents per acre.

The entire public domain has cost a little over \$88,000,000, or 4½ cents per acre. But the expenses of surveying it have thus far amounted to about \$50,000,000, and the expenses of quieting the Indian titles the enormous sum of about \$200,000,000. So that the public domain has really cost about \$338,000,000, or about 18 cents an acre!

How DISPOSED OF.—This vast public domain has been a coveted prize for which schemers have schemed and lobbyists have lobbied. It is estimated that about 20,000 propositions, involving grants of land for all conceivable objects, have failed in the Senate and House of Representatives, and much honor and praise is due to the men on the Congressional Committees having the public lands in charge. But many schemes have been successful, some of them of questionable propriety, yet upon the whole the public domain has been and is being disposed of to the best advantage. The following are the principal items: Cash sales, including preëmptions, commuted homesteads, etc., about 175,000,000 acres; donations, about 4,000,000 acres; military and naval land bounties, about 62,000,000 acres; railroad land grants, about 156,000,000 acres; canal grants, about 5,000,000 acres; homesteads, about 60,000,000 acres; swamp lands given to States, about 70,000,000 acres; schools, seminaries and agricultural colleges, about 79,000,000 acres; lands held under the Timber Culture Act, about 11,000,000 acres.

The railroads have been most successful in get-

ting lands from the Government. The Northern Pacific Road, which has just been completed, had a grant of 42,000,000 million acres—the largest ever given to any corporation—being an area nearly as large as the States of New York, Massachusetts, Vermont, and New Jersey, or nearly equalling Wisconsin. Though the Government still owns an enormous amount of territory the arable agricultural public lands are being rapidly absorbed. It is estimated that exclusive of certain lands in the Southern States there does not remain more than 15,000,000 acres which can be cultivated without irrigation or other artificial means. And these are being very rapidly taken. The facilities afforded persons in over-crowded foreign countries for reaching these lands and the generous liberality of the Government in giving them all farms, leave nothing to wonder at in the enormous emigration which is taking place. From \$100 to \$200 per person will cover the expenses of an emigrant journey from most of the European countries to the free lands of the West. Under the existing laws persons from such countries, after declaring their intention to become citizens, can get 160 acres under the homestead act, and another adjoining 160 acres under the timber culture act. Every head of a family can do this, and every other member of the family except the mother, of over twenty-one years old, can do the same. If an emigrant has a family of five children, all of age, he can get nearly 2,000 acres of land from the Government for the mere taking. There can be no serious conflicts between labor and capital, no real oppression of the laboring classes by monopolists, and no possible pretense of excuse for communistic doctrines in this country so long as such a condition of things exist.

Elevating a Slaughtered Beef.

Mr. H. C. Blackwood, of Washougal, Washington Ter., sends us a sketch and description of a very simple, yet powerful method of elevating a slaughtered beef, which a single man can easily

METHOD OF RAISING A BEEF.

operate. To any suitable support overhead, fasten the two ends of a strong rope, letting its middle portion down to the desired height. Insert a round gambrel in the hind legs, and bring the middle of the rope around its center. Place a stick long enough for a lever through the loop of the rope, as shown in the sketch. Carrying this round coils the rope with much force. [If the gambrel be four inches in diameter, and the lever two feet long, one hundred pounds force applied at the end, will lift twelve hundred lbs.; on a three foot lever, eighteen hundred lbs., and so on. Eds].—The carcass can be held at any point, by placing a stick between the upper end of the lever and the ropes. If properly adjusted, when the rope reaches the legs of the beef it will spread the quarters apart.

VENTILATE THE CATTLE STABLE.—Stabled animals require much fresh air, and to secure it there must be a way of escape for the foul gases forming in the stable. Confinement in a closely built stable is liable to bring on inflammation of the lungs and other serious diseases in the cattle.

A Weeding Hook or Hoe.

Mr. P. S. Dorland, of Deaus' Corner, N. Y., sends us full size sketches for making what he considers the best "Weeding Hook" he has ever used. A steel bar one-and-one-quarter inch wide and one-quarter inch thick, ten inches long, is hammered into the form shown in figure 2, the edges of the blade being made sharp by the smith and ground. It is bent in the form shown in figure 1, and the shank fastened in a hoe handle of good length.—[This is practically the "bayonet hoe," now sold at many implement stores. We have used one many

Fig. 1.

Fig. 2.

years, and for working among plants, using the flat edge like a common hoe, have found it preferable to any other garden implement designed for the same purposes. Indeed, it has usually taken the place of the common hoe after seed planting, not only in the garden, but frequently for field beans, corn, etc.—Ed.]

The Tobacco Ferment in Hookertown.

Seth Twiggs came in to my barn floor, where I was threshing beans, with an extra amount of smoke curling up from his old stump of a pipe, and greeted me with, "Have you heerd on't?"

"Heerd o' what?" said I; "there's are a good many things stirring in these days of telephones; a man can hardly lead his horse to water, but it is reported in Hartford."

"Yes, I know," said Seth, "but this didn't come over the wires, but happened right here in Hookertown. You see Mr. Spooner's sermon agin tobacco raisin', and chewin', and smokin', has raised the dander on a good many heads, and we are gwine to discuss the tobacco question in the club at the school-house to-morrow night, at early candle-light. Squire Way is coming up from Shadtown, and you chaps that are runnin' down the tobacco crop, and turning up your noses at tobacco smoke, will jest ketch it, see if you don't."

"Well," I said, "I've been eatheing tobacco smoke a good many years when Seth Twigg's pipe is 'round, and if there's anything worse than that at the club, I'd like to see it. I'll be on hand."

"Say, Squire, is Miss Bunker a gwine? You see, Tirzah would like to go, if the other wimmen do."

"No; Sally's mind was made up a good while ago, and though she says she's open to conviction, I'd like to see the man or woman that would undertake to convict her. There has been no tobacco on the farm or in the house since, not even to kill lice on the calves."

The sermon Seth spoke of was from the text, "Abstain from fleshly lusts which war against the soul," in which Mr. Spooner showed, to his own satisfaction at least, that the tobacco habit was one of these lusts, and gave the strongest kind of proof from scientific authority that it did make war upon the bodies and souls of men. Then, as his first "inference," if it was wrong for a man to injure his health and destroy his body, as many were doing, it was wrong to grow the weed, and to traffic

in it; the growers and the vendors were accomplices in the crime. It was these "inferences" that gave offence, and started the ferment in Hookertown parish. Mr. Spooner never dodges any responsibility, or undertakes to ride two horses headed in opposite directions. He is square-footed in the pulpit, and we listened patiently for his views on the moral uses of tobacco, and on other things.

It is fair to look at the financial drift of the tobacco crop, at the farmer's club, and in the agricultural journals. Hookertown has an experience with it of a dozen years, or more, and it may interest some readers of the *American Agriculturist*, who are expecting to make their fortunes in the business, to know the results. However profitable it may be in other sections, it is blue ruin here. Our farmers went into it with large expectations of making money, of finding it an easy road to fortune. Mortgages were to be paid off, bank-accounts opened, old houses repaired, new ones furnished, and rag carpets to give place to Brussels, with pianos, and silk dresses—in short, a new order of things, in-door and out. Exaggerated stories were circulated of its profits, such as that an acre of the weed could be sold for a thousand dollars, with clean culture and a favorable season. The less prosperous and careful farmers jumped at the chance of paying debts, and making money. Jake Frink, with his usual fondness for new enterprises, and forgetting his many failures, run in debt five hundred dollars for a tobacco barn. His son, Kier Frink, up in the White Oaks, stopped burning and peddling charcoal, and with a few other coal peddlers started tobacco patches. Deacon Smith was carried away with the craze, and his finest meadow became a tobacco field. Judge Hubbard, whose fine mansion overlooks the river, built a large tobacco barn costing six thousand dollars, for curing ten acres. The barns went up in all directions, great and small, according to the means and enthusiasm of the owners.

Well, after a dozen years of trial and costly experience, we have got down to hard pan, and the bottom facts are visible. The man is not to be found in Hookertown who has made a fortune by raising tobacco. Some have quit the business, and even those who continue it, admit that it does not pay at present prices. The big barn stands empty, and as Mr. Spooner rides by, he quotes from Paul, "They that will be rich, fall into a snare, etc." The brush pasture acreage is increasing, and the heavy business on many farms, now, is earthing wood and timber to the river landings, to raise money to pay help. Sugaring down the experience, we have these facts:

1. The tobacco crop requires a good deal of capital to make it profitable. A good barn, built or made over for the purpose, is essential to success. Only heavy manuring and skilled labor will make it pay, and both are expensive.

2. It is an exacting crop to raise, cure, pack, and sell, requiring more watchfulness than most other crops. Starting the plants requires close attention; transplanting needs a wet spell when rains are often wanting; cultivation must be frequent and thorough; topping and worming must be looked after; and as maturity approaches, there is great peril of the early frosts, and liability to damage or total loss. After harvesting there is need of watching in curing the leaf, and experience and skill in regulating temperature and air. Then, stripping and proper packing depend much upon the state of the weather. There is little rest from anxiety, from planting until the sale.

3. It is more uncertain than most other crops. There is one crisis after another, from June to December, and when ready for sale, the price is unsteady and often below the cost of production. There is a gambling element about it not friendly to industrious habits.

4. It tends to divert farmers from more legitimate crops, which feed and clothe the race. This does neither, but sends sickness and poverty into many a home. The grains, vegetables, and grasses, beef, pork, mutton, butter, cheese, poultry, and eggs, are necessities of life.

5. There is little or no manure in this crop. The stalks, if kept upon the farm, are indeed a good

fertilizer, but there is comparatively little of this residue. A ton of hay, consumed in the barn, makes five dollars' worth of manure, if properly cared for, and a ton of clover hay, nine dollars' worth. All animal products make manure to enrich the farm.

6. But tobacco growing, as usually practised, runs out the farm. A few acres may grow fat, but there is leanness in every other spot. Meadows run out and pastures grow up to brush, and there is less grass and hay, fewer cattle, less butter and cheese. If a man gets a little money in bank with this crop, he is likely to lose his farm as a machine for making crops. The deserted farms, the old chimney stacks, the increase of brush and forests, where the plow and the scythe once gathered their harvests, are sad commentaries upon the tendencies of this industry. If any man wants to go into this business, let him hear the wisdom of Hookertown, as she cries on every street—"Don't!"

Yours to command,

TIMOTHY BUNKER, Esq.

HOOKERTOWN, Ct., December 7, 1883.

A Cheap Good Saw-Horse.

Having a rough lot of fire-wood, eight to fifteen feet long, irregular round sticks, straight and crooked, from two to seven inches or more in diameter, we made a saw-horse in less than half an hour that has done good service all the past year, and is as good now as ever. An oak stick averaging half a foot in diameter, was selected from the wood-pile, and a piece five feet long cut off. Two one-and-a-half inch auger holes were bored near each end, not quite opposite each other, to avoid weakening the timber at one point, and four strong sticks from the same wood-pile were driven in for legs a little under two feet long, and standing well slanting outward. Six one-inch auger holes were bored in the top, and split out pegs eight or ten inches long were driven in, in a position to firmly hold the wood to be sawed. The two pegs of each pair are not directly opposite, but separated far enough for the saw cut to run down between them.

A LONG SAW BUCK.

Of the first pair one is four inches from the end, and the other seven inches back. The second pair is fifteen inches back of these, and the other in the farther end of the horse, these last answering as a support to the long end of the wood to be cut, the other two pairs being used as the saw-horse. When a stick is reduced to five feet or so in length, it is drawn forward and wholly supported on the two pair of pins near together. The whole is solid, cheap, and thoroughly convenient and effective.

Young Trees on the Prairies.

It is not yet too late to secure Cottonwood cuttings. This tree is not specially commended, but as many will continue to plant it, some suggestions based on experience are offered.—1. Take no cuttings from other than thrifty, vigorous young trees, of an erect clear-limbed habit of growth.—2. Cuttings should be a foot long, and be set in a slanting direction, so as to leave but one bud above the ground. Tramp the earth firmly over them.—3. The next spring, after the cuttings have grown one year, cut them off just above the ground, so as to leave not more than one bud above the soil. This will give one strong, vigorous shoot, and tend to destroy the forky, sprangly habit, which often spoils young Cottonwood trees grown from cuttings. The same plan may be profitably pursued with young seedlings. Many

Western readers of the *American Agriculturist*, will have young Cottonwood plantations a year old next spring, and ready for this treatment. Do not be afraid to cut them off. They will be larger in two years after, than if not thus treated. Young Ash require about the same treatment as Cottonwoods, under the same circumstances. —4. Stir the soil often but not deeply among the young trees, and keep them free from weeds.

Support for Sliding Bars.

"H. L. C.," Rochester, N. H., sends us a sketch and description which we give with a little modification. The bars are say twelve feet long, requiring the posts to be set eleven feet apart to cen-

ARRANGEMENT OF THE BARS.

ters. The fence boards, coming in from each side, are nailed fast. An upright piece is fastened to each post, standing out far enough to let the bars pass in against the fence boards, and rest on stout pins of iron or hard-wood. On the fence post, seven or eight feet distant, a similar piece is put on, with space for the bars to slide in on the pins as shown by the lower bar partly open. By this arrangement each bar, as moved back, nearly balances itself, requiring little exertion to hold and move it, until it reaches the pin in the post, when both ends being supported, it slides very easily back and forward. There is no stooping to pick up the bars or going to one side to draw them through. It may be well to make a slight notch under the left-hand end of one or more of the bars to drop over the pins, to prevent animals pushing them loose when rubbing against them. If any cow or other unusually intelligent animal learns to lift and shove the bars, as we have known done, a bit of wood over the notched end will hold it down.

Horticultural Facts.

TREES FOR IRELAND.—Among the plans for the relief of the rural population of Ireland, *Afforestation*, or planting forest trees, is now seriously advocated. That there are wide areas in that generally beautiful country suited to timber culture, all who have traversed it are aware. It is claimed that preparing the land and planting the trees will afford immediate relief by giving employment to large numbers; the forests thus planted would be a provision against future times of scarcity and trouble. It is probable that the aid of the Government will be asked in behalf of the scheme. The project is one that seems to commend itself as eminently wise and practicable for that popular island.

SINGLE DAHLIAS.—The remarkable "boom" with which the new single Dahlias started in England a few years ago, does not seem to have subsided. They have not yet attracted the attention in this country which they really merit. A few exhibitions like those made by our growers last autumn, must attract amateurs to their great variety and richness of color. The English growers have, the past season, succeeded in obtaining a "break," and they now have one, the "Union Jack," in which the white ray florets are striped with red, and it is said to be very brilliant. This result should encourage our own growers of seedlings. There is yet a future for these easily cultivated and showy flowers.

FORESTRY EXHIBITIONS.—Preparations are being made for an Exhibition of Forestry, during 1884, at Edinburgh, Scotland. It is intended to include everything relating to the forestry of the world. Essays and reports are expected, both upon forestry and forestry materials in every form. Our country made such a creditable showing at the great Fisheries' Exhibition, last year, that we hope Congress

may aid in making an exhibition of our forestry. The date of opening is not yet fixed, but it will probably be early in July.—It is also proposed to hold at South Kensington, in the ample halls occupied by the Fisheries' Exhibition, an International Horticultural and Forestry Exhibition in 1885. This early announcement allows ample time for those wishing to exhibit to make preparations. We trust American horticulturists, and especially those interested in forestry, may be as creditably represented in this as we were in the fisheries exhibition.

THE TUBEROUS-ROOTED GRAPE-VINE.—We some time ago announced the discovery in Cochinchina and in the Soudan, of a grape with large tuberous roots, a rampant annual stem, and an enormous bearer. Whether the vines from the two localities are identical or not, remains to be seen. The vine does not appear to have fruited in Europe as yet, but in Portuguese Guiana it has been successfully cultivated. Accounts differ as to the quality of the fruit and of the wine made from it, though all are agreed as to its prolific character. We hope it may be found adapted to some of our far Southern States.

MANY-FLOWERED ROSES.—This class of roses (*Rosa polyantha*) has not yet become generally known in our country. When better known they must become popular. Their small flowers are in large clusters of great delicacy and beauty, and must be useful in bouquets. Mr. Jean Sisley writes us from Lyons, France, that a new variety of this class, the "*Perle d'Or*," received a gold medal at the floral exhibition last autumn. It is a dwarf perpetual, with pale-yellow flowers, deeper in the centre, and the petals edged with white. He thinks it will prove fine for pot culture.

AN AMERICAN VIOLET.—Our native Birds-foot Violet (*Viola pedata*), so common in sandy and gravelly soils in the Northern States, has succeeded most admirably with us as a garden plant. It keeps in bloom much longer than when wild, and its lilac-purple flowers are large and showy. We are glad to see by the journals that this violet is attracting attention in England. There are two wild varieties of this, well worthy of a place among choice hardy flowers. The White (*Viola pedata alba*), some specimens of which are fragrant, is quite abundant. The other, and rarer variety (*bicolor*), has its two upper petals of a dark, rich purple, with the velvety appearance seen in some pansies, making it the most beautiful of violets. It blooms all summer.

Pigeons and Pigeon Houses.

BY D. Z. EVANS, JR.

Breeding pigeons affords especial delight to almost every boy, and those once getting a start will soon have more birds than they know what to do with, unless they are neglected or some accident occurs. As with "grown up children" the first boy making a good start in a neighborhood with pigeons is sure to soon have many followers, often to the advantage of the pioneer who has surplus stock to sell. Many a farmer's boy has yearly earned quite a sum by raising squabs for the early spring markets; and they have sold all the way from twenty-five cents to two dollars a pair, according to the season, demand, etc. As the common large pigeons make good squabs, a stock to begin with costs but little. Later hatched birds are readily sold in autumn, to sportsmen for trap shooting, at twenty-five to forty cents a pair, according to the demand, which is sometimes large.

As there is much interest in "fancy pigeons" many boys, and men too, are making good snug profits by producing pure-bred varieties of various kinds; those who have considered pigeons mere children's pets will be surprised at the large prices paid for many choice birds in the show room.

PIGEON HOUSES, neat and attractive, cost but little. Fig. 1 shows an independent house, and Fig. 2 one attached to another building. Fig. 1 is set on posts about five and one-half feet long, eighteen inches in the ground and four feet above. These are capped with inverted tin pans to keep out cats,

rats, mice, etc. Four to six inches in diameter is heavy enough; cedar or chestnut posts are most durable. The house may be of first-class three-quarter or choice one-half inch stuff planed on both sides; the floor should be of one inch boards.

Good dimensions are six feet long and four feet wide. Place neat windows in each side about two feet long and one foot high. An entrance door for the breeder is just in the rear (not shown). Make a ventilator in each end under the peak, protecting it from driving rain. The pigeons enter through a skeleton affixed on the front end, made as light as possible, but secure, staying it with wires from the two upper corners, and if necessary placing supports under its outer corners. Common lath will serve for making a neat cage of this kind. It may have a solid floor of one and one-half inch stuff, or be slatted. The latter is objectionable in many ways. A sliding door, controlled by a string, admits or excludes the birds from this cage at

Fig. 1.—AN INDEPENDENT PIGEON HOUSE.

pleasure. Such a house, thoroughly and frequently painted, will last many years, even if made of half inch thick pine boards. Neatness and cleanliness do much to insure success; and purchasers will sooner purchase from and pay the best price to those having the best appearing houses. Pigeons do better and are freer from disease in an outdoor house than in one, over-heated and illy-ventilated, in a room in a dwelling house, barn, or granary.

Figure 2 is a cheap style of a pigeon house built against a barn, granary, or carriage house. If desired, it can extend along the entire end or side of the building. As the building furnishes a back and half the support, it is much cheaper than an independent house. The floor and roof are firmly fastened to the building with strong nails attached to two by three-inch pieces. The outer posts are the same as in fig. 1, and as many and as long as needed. A good light is four feet above ground and six feet from the floor to the highest point, the front being three feet high. Small sash in front, or on either or both of the ends afford necessary light. The floor, ends and roof should be of inch stuff; for the front, three-quarter or one-half inch boards will do. A skeleton cage or exercise room should run the entire length, supported as shown in the en-

Fig. 2.—A PIGEON HOUSE AGAINST A BARN.

graving, or the weight may pull the house from the main building. The space underneath may serve as a shelter for small implements or be fixed to accommodate many chickens at different seasons of the year. Ventilators should be made at each end and at the highest point of this pigeon house.

Mending Rubber Boots and Shoes—Dissolving India Rubber.

For many years we have had, at the approach of winter, a number of inquiries about mending India rubber boots and shoes, and they have begun to come this season. In cities, the large stores for the sale of rubber goods of all kinds sell a cement for mending rubber articles. Where this can be procured it is cheaper to purchase than to undertake to make a cement. Pure, or virgin rubber, *i. e.*, rubber that has not been "vulcanized," which is very far from pure—is more or less soluble in various liquids. Pure ether, chloroform, pure turpentine, benzole, naphtha, and some other liquids, especially bisulphide of carbon, either cause the rubber to swell up into a soft jelly, or dissolve it altogether. When exposed to the air, the liquid evaporates, and the rubber is left more or less in its natural condition. To use any of these compounds, including that sold (usually rubber dissolved in turpentine), the edges of the patch, and portion of the shoe, etc., should be freshly cut, where it is to be applied. Rubbing the surface with sharp sand paper will often answer instead of cutting, the object being to secure perfectly clean and fresh surfaces at the junction. To make sure of a good job, the surfaces are often covered with the cement, and allowed to dry; then a fresh application of cement is made and the patch carefully adjusted to its place. It is necessary to avoid touching the fresh surfaces. The parts should be held closely together after cementing, by placing weights on them or by some other device. For home make, bisulphide of carbon is the most ready solvent for the rubber. The same difficulty is found here, as in buying the cement, it is only sold in cities and in large places. One part of virgin rubber, cut into thin slips, is to have six or seven times its weight of bisulphide added to it. The solution will, in time, take place in the cold, but more rapidly with the aid of heat. Place the materials in a glass or tin vessel, and set this in another of hot water. Keep the inner vessel from the bottom of the other by two small sticks. The bisulphide of carbon is very volatile and dangerously inflammable, and this should be kept in mind in working with or handling it near a fire or a light. Being so volatile both the sulphide and the cement should be closely stopped. Our correspondent, "J. W.," Harford Co., Md., asks: "How can rubber be melted?" Rubber melts at a high heat, but is of no use in this condition as a cement.

Bracing End Fence-Posts.

Mr. J. Bartlett, Oshawa, Ont., sends us a sketch and description of a mode of bracing the end posts of wire fences in wet, soft land. The post is set

Fig. 1.

down three to four feet, according to the softness of the soil, and any irregular stone bedded against it, as shown in figure 1. The piece, *c*, is notched in near the foot of the post, or held by a strong spike, or better by a bolt, and the horizontal piece, *a*, nailed on. The upper fence-wire is given a turn around the top of the post, brought over through a notch in *c*, and fastened to the stone by a turn or two around it. The operation is seen at a glance.

[This will answer where stones of proper size are

available near such land. It has the advantage of allowing for the contraction and expansion of the wires, even though the projecting arms and stone may be in the way, and unsightly. If the end post be in the corner of a lot, it may be better to brace

Fig. 2.

the next post to it, and let the stone hang down close along the wires.—Another method for using the same materials is shown in figure 2, where the weight-stone is placed in the soil, with brace resting against it. This does not provide for contraction.]

The "Cattle Pull."

What the race track is to many agricultural gatherings, the "cattle pull" is to not a few New England fairs, and well it may be. The go-ahead Westerners are ill content with slow ox-teams; the more speedy horse, and machinery worked by horses, better suit their broad plains and their ideas. On the great pastures a steer is looked upon for the amount of round and sirloin steaks he will furnish, the dollars he will balance on the scales in the cattle pen and slaughter yard. Imagine a Maine boy telling his Western friend that his steers had gained six inches in girth, and earned their living while doing so! To the latter, the idea of a steer being compelled to earn his board is scarcely comprehensible. But in much of New England, especially among the pine trees of Maine, working oxen are appreciated, and at the shows dispute the claim to public attention with the fast horse that absorbs so large a share of admiration in other sections. Hence the "cattle pull" is a feature in most agricultural exhibitions at the far East. It is a novel and interesting sight to one witnessing it for the first time—the level sward set off by a rope, and surrounded by an eager throng of anxious farmers discussing the points and merits of a favorite yoke of oxen, attached or to be attached to a drag weighted with tons of granite slabs. The question to be decided is, which oxen, or whose, is to carry off the palm, by moving the ponderous load the greatest number of measured feet and inches—in other words, which breed, what strain, what feeding and care, what training, have produced oxen that can supply the most strength when put to accurate comparative tests. The trials are of single pairs, and with several teams to show how they will pull together, an important point often.

You see the committee man mount the load, and he calls out so as to be heard by the vast throng, "These cattle are owned by John Martin; girth, seven feet; weight of load, eight thousand five hundred pounds." At the word, the animals, as if conscious of their importance, and that their own credit and that of their owner is at stake, put forth giant efforts. "Fifty-six feet, four inches," is announced. Half a dozen men add their weight to the load. "Twenty-three feet, nine inches," is recorded.—Another yoke takes its turn, but not yet trained to pull at command, and when unhitched, the load has not advanced an inch.

At last autumn's fair of York County, at Buxton, Me., an old dispute was to be settled between two farmers' yokes, one of which had been victorious at the N. E. Fair, and the other at the Eastern Maine State Fair. Both yokes were Buxton cattle; both girthed seven feet three inches, and never had "St. Julius," or "Jay Eye See" more ardent adherents than these bovines. The enormous load of over FIVE TONS (10,500 lbs.) was to be pulled over a grass stubble by a chain. The record of the victors was: Twenty-four feet in twenty pulls!

Who Owns a Boy's Wages?

"W. B. R.," Otsego Co., N. Y., inquires: "If he hires a young man under age, paying his wages as earned, has the father a legal right to collect the amount from him, when he has not given notice that he claims his son's wages?"—This is an important question, as many minors are employed upon farms, and we submitted it to our legal contributor, who replies in this wise: The law writers say that the parent, being under obligation to support, care for and educate his minor children, he is entitled to their custody and the value of their service (2 Kent's Comm., 194; 1 Blackstone, 153). The Courts have several times confirmed this view (7 Mass., 145; 15 Mass., 272; N. H., 28; 15 N. H., 486; 4 Mason, 380). But this right hangs by a rather slender thread. If the minor has been "emancipated," or, as we commonly say, "his time has been given him," then he is entitled to his earnings, can sue for them if necessary, and they should be paid to him, which discharges the debt (6 Cushing, 458; 8 Cowen, 84; 3 Barbour, 115). This emancipation may be brought about by a written instrument, or by a verbal agreement, or by the conduct of the parties. (Shouler's Domestic Relations, 368, and case there cited). The parent's casting his child off or leaving him to shift for himself, forfeits his right to his earnings, and the Courts are liberal in granting such children the right to their wages, and thus encouraging them to earn an honest living themselves. (See many cases cited in Shouler's Domestic Relations, p. 370). A parent's consent to the marriage of a minor, works an emancipation, for the reason, it is said, that in such cases the minor needs his earnings to support his own family. This alleged reason would seem to be just as forcible if the marriage were without parental consent, since the family would need supporting just as much; but a Court in Maine thought otherwise, and gave to the father the young benedict's earnings, leaving the poor wife without a penny (24 Me., 531; 18 Texas, 367). A parent absconding to parts unknown emancipates the minor child, and cuts off a right to his earnings (2 Metcalf, 92). Emancipation may result from misfortune (15 N. H., 490), as when the parent, becoming a pauper, is unable to support his child. This extreme doctrine, however, was only asserted on the ground that, if the parent received the child's wages the latter would himself become a pauper. If a parent authorizes the employer to pay the minor, or the minor to receive the wages, payment to the latter is legal. Such authority may be implied from circumstances (10 Barbour, 300; 19 Pick., 29.). American Courts favor such arrangements between father and son; they are in the spirit of our free institutions. A N. Y. Court, following a Mass. decision, held that if a son goes out and contracts his services on his own account, with the father's knowledge and without objection from him, the payment to the son cuts off the father's claim (10 Barb., 300; 2 Pick., 202). Another Massachusetts case went so far as to imply that unless the father notified the employer that he claimed the son's wages, the employer may suppose authority has been given the son to collect his own wages (15 Mass., 273). New York and some other States provide by statute that payment to a minor will be valid unless the father gives notice to the employer that he claims the minor's wages, within a certain time after the hiring. In New York State it is thirty days.—The above meets the case of our inquirer, and in that instance renders the father's claims worthless, unless, perhaps, the boy had run away from home, and the father did not know of the hiring. But not all the States have such statutes, and in those which do not have them the doctrines above set forth are presumably in force. It is, however, safe to advise all parents to give prompt notice of any claims to minor children's wages, and all employers to ascertain from the parents of non-emancipated children how their wages shall be paid, if they would avoid all possibility of having to pay twice. [This is an interesting topic, and the above will answer several inquiries that have been made from time to time.—EDS.]

TALKING OVER THE CROP PROSPECTS.

Drawn and Engraved for the American Agriculturist.

All the speculation in crops does not take place at the New York Produce Exchange or at the commercial centres of other large cities. Many transactions, some of them of considerable importance, occur in country stores, village taverns, and even in the farm houses. Within a few years a new branch of the produce business has been developed, that of making the purchases by travelling buyers. These are now a recognized class, as distinct, if not as numerous, as the well known

"drummers." The buyers, while very shrewd business men, are affable and companionable, and are able to make themselves at home with the farmers, with whom they talk about crops and their prospects. By going about and meeting the farmers at stores, etc., they are able to form a fairly correct estimate of the probable yield of apples, potatoes, and other produce in the district. From data thus gathered, the buyer is able to make bargains for produce, to be de-

livered at the cars for a given price, on a future date. Often by paying a needy farmer a portion of the purchase money in advance, they drive a more favorable bargain for themselves, while the farmer is able to meet his interest or other payment. The business has some good features, and in many localities is favorably regarded by the sellers. The buyers knowing this, usually so time their visits as to appear in the farming neighborhoods not long before the period at which interest on mortgages is payable.

Marking Things—Home-made Stencils.

The owner's name put plainly on grain bags, hoes, rakes, spades, shovels, steelyards, etc., and on larger implements, is very convenient, and will very often save their wandering and loss. We have long kept a steel punch, a piece of iron one-half inch square, the corners rounded off a little, the lower end terminating in a flat piece of steel, three-sixteenths-inch thick and three-fourths-inch wide. On the bottom edge of this the letters of the surname and initial of the given name are cut in relief. With this, and a hammer blow or two on its head, the name is cut into every implement, large and small. It is beaten into any soft iron, if there is any, otherwise into the wood, and has doubtless saved twenty times its cost (twenty-five cents a letter) in keeping a great variety of things from straying off, or remaining in possession of borrowers, who are thus precluded from saying of them "they did not know whose they were." These punches, made to order, can be got by mail at moderate cost.

STENCIL PLATES are very convenient, not only for marking boxes of merchandise, but also farm implements, grain bags, barrels, etc. They are thin strips of tin or other metal, with the letters cut through. The stencil is laid flat upon any ar-

ticle, and a brush or cloth wad, smeared with a lamp-black mixture, is brushed over the letters, marking through the openings. It is important to keep the edges straight and even, so that they will lay flat and close upon the article to be marked, or the color will spread out under the plate, and the interior lines run together. Such plates are made to order usually at five to ten cents per letter. "Iroquois," of Jamestown, Ohio, sends us a method of easily making stencils at home, at no cost, if one has a simple bracket saw which will cut tin plate. Mark the desired letters on paper, being careful to have the pieces inside the letters supported by attachments to the outside. Paste this paper on any piece of tin, and saw out the parts to be removed. Old fruit cans serve well for the plates; the bottoms and tops are taken off by melting the soldering, and the side seams cut off with shears. With a mallet beat it out to a smooth, flat plate. Lamp-black mixed with coal oil, kerosene, or spirits of turpentine, makes a blacking mixture. A coating of common varnish applied after they are dry enough, renders such letters permanent. The boys may well exercise their taste and skill, and find amusement, in getting up a variety of such plates, as a present to father, and for their own use.

THE KEIFER (OR KEIFFER) HYBRID PEAR.—The discussion as to the value of this singular pear, has extended to the "secular" papers. Mr. C. A. Hovey, having suggested in the "Massachusetts Plowman," that the pear is a "humbug," Mr. Josiah Hoopes, of Pennsylvania, writes in its defence in the "Philadelphia Press." Having been the first to figure and describe this pear (see *American Agriculturist*, January, 1879), we take some interest in the controversy. We then said: "While it may not come up to the high standard of 'best,' it is of sufficiently good quality to be acceptable to those who esteem the Bartlett." Our aim has always been to induce our readers to grow fruit. We do not need to be told that the Concord is far from being a first class grape, that the Wilson is one of the poorest strawberries, but one who has a Concord vine, or a patch of the Wilson, is quite sure to have fruit in abundance. Our object has been to have people begin with fruits from which they would be sure of results, believing that they would soon try better kinds. The Keifer Hybrid tree has proved in healthfulness and productiveness, all, and more than all, that was claimed for it. The fruit is large, strikingly handsome, and sells rapidly

at a paying price. It is not a Beurre Bosc, or a Winter Nelis, but it is a pear, and the tree has thus far withstood "leaf," "twig," "insect," "frozen sap," and every other form or stripe of "blight." If it were only fit for baking or preserving, we should regard it as of great value. As one who has found out that he can grow Concord grapes, soon makes his way to better kinds, so those who are encouraged by their success with the Keifer, and pleased with its size and great beauty, will soon wish to go a step higher in the list of pears.

The Chief Crop of the Country.

BY E. P. ROE.

What May is for grass, and July for corn, these winter months are for the invaluable growing crop of boys and girls; and upon the care and attention given to this crop the future of the country, the lights and shadows of our own coming years, and the success of the boys and girls themselves, largely depend. The stock breeder looks carefully after the development and training of his animals, especially if thorough-breds. Should not we with more solicitude try to make thorough-breds of our children? Which do you visit most frequently and examine with most diligent interest, the developing animals, the grain fields, the fruit trees or the olive plants in the school-room? Do you personally know the trainer there—his manner and methods? What morning and evening attention do your children get, save to know that the chores are well attended to? Do you father, and you mother, personally know where they are in the evening hours, who are their associates, what outside influences are molding their characters? Do you know that they are developing as strongly, as symmetrically, as rapidly as they might?

I credit every reader of the *American Agriculturist* with understanding well that mind is the true stature of the man or woman. Are you content with providing shelter, clothing and food, and to see them add inch by inch to stature? One hundred and forty pounds of flesh and bone may not make a man; they may constitute an ill-natured, ignorant cad or boor. One hundred and fifteen pounds of feminine symmetry do not make a woman, even though expensively clad. They may present a parody, a caricature, a false sham that will bring bitterness and disappointment to more than one heart.

It is not essential that young men and women be positively bad or obtrusively disagreeable, to fall short of what they should or might be. If we plant a tree or vine of the best variety, and allow it to grow without special attention and training, we know well what we shall find after a lapse of years. It may overspread a wide area of soil, with a useless mass of wood and foliage, yielding a few defective apples or ragged clusters of grapes, that are not poisonous, but such fruit is not in demand in the world's market, nor desirable for the home table. So the boy or girl merely left to grow, develops much as the neglected vine. They may never become vicious, and may even be spoken of as good at heart, like the half-barren apple tree, but are scarcely worth the room they take up in the world.

Are the daughters, when receiving their bent in in early age, actually learning how to fill their future positions well—how to be wives, how to keep the house orderly and make it inviting; to help economize for rainy days ahead, to provide, perchance with limited means, a daily variety of inexpensive yet delicious, well-cooked healthful food. Much of the dyspepsia and ill-health now prevailing is chargeable to lack of early training in the home circle.

If a girl is learning to play upon the piano, is the acquisition of a few showy pieces her aim, or is she studying music? There is as much difference in the two efforts, as between pinning material together to look like a dress, and the power to cut and make a graceful costume. Washing dishes

steadily a thousand years, will not teach a girl, the high art of thrifty housekeeping; she should not be merely taught to do housework, but to keep house.

Boys may work on a farm until grown up and then be less able to take charge of it than a finest hand. Childish helplessness, combined with physical maturity, is so often seen because children receive knowledge too much as potatoes are placed in a bin—both in a crude state. The one makes blood and muscle, the other mental expertness and power, but both need proper preparation and assimilation. Boys taught to farm as well as to work on the farm, are far less anxious to leave home for town or city. Instead of mere treadmill drudgery day after day, enlist interest in the sciences related to farming with its endless variety. Show a boy that some of the finest minds and most eminent men in the world have been devoted to this calling. Interest him in a pair of blooded fowls or pigs, if not in larger animals, and let him have a pecuniary interest in their increase, however small, also in some crop that he aids in cultivating. Above all, incite him to learn how skill can make "two blades of grass grow where there was but one before."

Now, the long evenings supply just the opportunity for fathers, and mothers as well, to give personal and special attention to the most important product of the farm, the growing crop of boys and girls. The boy at yonder table is studying his lessons; doing "sums" perhaps. Is he merely tumbling dry rules and disjointed facts into his mind to be repeated parrot-like? Suppose you come out of your doze and talk with him. See that he knows why he adds and multiplies. Teach him to apply his knowledge to every-day affairs. Give him the purchase and sale of your farm products, the expense of fields and crops, implements, etc., and have him apply the knowledge he is gaining. Teach him to use it as the soldier uses his weapons, and the mechanic his tools. Your interest in what he is doing will add to his interest, will make him more ambitious, more thorough and more practical. If he is studying geography, show him that the towns and cities he is hunting on the atlas, are not mere dots on the map, but places full of live men who will certainly get ahead of him unless he use his knowledge aright.

And the same is true of the daughters. The results of half hours thus spent will be a surprise to both yourself and the children. If your own early education was faulty and they teach you in some things, it will be all the more interesting to them.

Now is the time to enlist your sons' enthusiasm in your calling, perhaps to rekindle your own also. Go over the *Agricultural Journals* with them and let them see and know what live men are doing and thinking, and awaken emulation. Let a book or two about some part of your business, or the whole of it, be read to you by the boys. Draw out their comments and make your own. Remember the story of the industrious man, who was ever repeating, "he worked only for his children." Indeed he worked so hard that he never had time to form their acquaintance, much less to help them to become men and women. As a result they soon scattered what he had gathered for them.

You want your children to sympathize with your life and work. Sympathize with their life and pleasures—the life and fun that you enjoyed at their age. A holiday with them now and then, will not be lost time, it will be more than made up by increased efficiency on other days. You can thus renew your youth and give joy to theirs. Recall your own thoughts and feelings when at their age. A few holiday gifts within your means, will bring unalloyed pleasure now, and for many days to come. Make a child happy and he can scarcely fail to be good. At the same time let him be initiated into the secret that those are most happy who add most to the happiness of others. Is your home not a happy one? Ask yourself what you are doing to make it happy. Be not like the publican, always sitting at the receipt of custom, taxing others.—Subject yourself to a little examination.

Preventing Cattle from Browsing.

While that is not the best farming which devotes the same land to orchards and pasturage, yet it is often convenient, sometimes necessary, to allow cattle to graze among trees. Swine are the only farm animals that will do no mischief when allowed free range in the orchard. Cattle, the most gentle, are perverse; however abundant and succulent the grass, they will vary their diet by browsing. It may be they require the tonic bitter of the apple twigs to increase their appetites for the grass; but they will do mischief. Whether among fruit or ornamental trees, they must be prevented from lifting their heads. On the Island of Jersey, where orchard pasturing is general, and where the animals are always tethered, a singular crib-like

understood. So the Carpean be made a toothsome feature of the dinner table, if the mistress of the kitchen comprehends the mysteries of the sauce-boat. Without that skill, which by the way is universally possessed by our adopted German fellow citizens, and can be learned from almost any of them, the carp is rather tasteless. In very cold spring brooks carp will not grow at all, they rather seem to shrink, if we can imagine a fish shrinking with the cold. But in warm waters, especially in the Southern States, where there is no trouble with frost, they attain an enormous size quickly. There have been instances of their growing to seven pounds weight in two years, which far surpasses anything known of any other species of fish. In the North, if the ponds have hard bottoms and freeze their entire depth, the carp will be killed. But if the bottom is soft and muddy, they

Above-Ground Cellars.

Eben E. Rexford writes us very urgently in favor of having cellars always above ground. He does not explain how he would construct them, but we gather that he would build against one side of the house, as a part of it, with double walls and a covering that would keep out frost. As for that matter, if on the rear side, they might not be very offensive in appearance, and they might be hanked up and covered with earth and green sods, and even be covered with plants or trailing evergreens. If adjoining the kitchen warm air enough might be admitted to keep out destructive frosts in very cold weather. These are only suggestions of our own. Mr. Rexford's arguments are that cellars thus placed could be entered on a level like other rooms,

PREVENTING CATTLE FROM BROWSING.

Engraved for the American Agriculturist.

structure of wood is used to protect the trees, which is not put upon them, but on the cows. If the gentle creatures have any sense of the ugly, one with her deer-like neck encumbered with such a timber structure would keep her head down for shame, without the need of all its weight. Much simpler are the various methods shown in the engraving, which do not disfigure the animal, and are equally as effective as those more cumbersome.

The Carp as a Food Fish.

BY ROBERT BARNWELL ROOSEVELT.

There is much inquiry concerning the German Carp introduced into this country by the United States Fish Commission. People want to know where it will live, how fast it will grow, and generally what it is worth now that we have it. Often as these questions are answered they come up again, and in truth, the different results reported are confusing unless accompanied with an explanation. Carp are not a first class table fish, but they are immensely superior to no fish at all, when a fish dinner is wanted. They are not as good to eat as the bull-head for instance, but then it may be said that the bull-head is a very excellent fish when well

will burrow into it and protect themselves. They are said to feed on vegetables, either the natural growth in the water, or the refuse from the garden, but I imagine they are greatly improved by an occasional taste of the numberless insects that are found on all aquatic plants. The same rule applies to them, that is found to govern in all other departments of nature; the best is always the hardest to get. Not only will carp never supply the place of trout, but they will hardly live in the same water. They need little care, and will exist on poorer food, are content in less fine water, and they are in the end an inferior fish. The common proverb says that whatever is worth having, is worth working for, and that, translated into fish literature, means that an ordinary variety is more easily maintained than a superior one. Still there is always more need of the lower class. Few men eat trout, more eat shad, and infinitely more use cod, while the ponds that are adapted to trout, are not as one in a hundred to those fitted for carp. Any old sluggish pond, above a mud-hole, will answer for them. In conclusion, it is almost self-evident that carp are no more a game fish, than a fattened hog is a game animal. Carp can generally be procured through the State Fish Commissioners, and several breeders offer them for sale.

by a door direct from the kitchen, and a great deal of running up and down stairs would be saved. He further argues in favor of such cellars that they are more healthful, since there is always a large amount of odors and noxious gases from materials in the underground cellar that rise up and penetrate all through the house, which would be blown away if it were placed outside the house. Again, if on a level, they would be far more likely to be kept clean like other rooms. It is often no small job to carry out the large amount of refuse that is constantly accumulating. Where much milk is produced, and the cellar is the only dairy room, as it is on a large majority of farms, the saving of labor in going up and down stairs to attend to the milk, is an important matter.

The question of economy in construction is one item in the account. Every house must of course have a solid foundation, and the first floor should be two or three feet above ground, or more. The expense of excavation, and of the walls extending below the needed foundation, would usually balance a portion of the cost of an above-ground cellar. There are several arguments on both sides of the question. Let us have some plans and estimates of building cellars on the ground from our readers. "The question is before the meeting."

Wood-House and Wash-Room.

Multitudes of farmers and others have a very good dwelling that answered all purposes when it was first built, but they now want more room in the form of summer kitchen, washing-room or laundry, store-room, etc. The present kitchen has baking and cooking, washing, ironing, etc., and in

Fig. 1.—SIDE VIEW OF WASH-HOUSE.

many cases this is the only available room, and in the absence of others serves as dining and sitting-room. It is generally desirable to have the wood-house and wash-room connected directly with the dwelling, or built as part of it, yet some will prefer to have them separate; while in other instances the addition of these to the present buildings would entail considerable expense, and many undesirable changes, such as shutting out the light from one or more windows, placing the stove in an inconvenient position, increasing the number of doors too greatly, etc. The building here presented will supply or suggest one remedy, in the form of a detached building, which, however, may be so near as to afford ready passage to the old house. The building here shown is sixteen by twenty-six feet. It is enclosed either with matched or battened stuff, planed and painted. This is cheaper than clapboarding, and is warmer and more durable. The outside entrance is to the wood-room, from which another entry is to the wash-room. The wood-room is fourteen by sixteen feet, and is large enough for most houses. A charcoal bin is shown. If hard coal is the principal fuel, the room may be considerably smaller. The coal bin, or bins, if coal is the chief fuel, should have outer doors for filling direct from the wagons. If wood only is used, it should be neatly piled along the end of the room. There should be a door at least three feet wide at the most accessible place for a wagon, for throwing in the wood. The floor should be supported by strong sleepers or joists, though if the wood is to be worked up under shelter, it is better to dispense with the floor, and simply fill in hard earth a few inches above the outside, to have it always dry. The wash-room is twelve by sixteen, and should

Fig. 2.—INTERIOR OF WASH-HOUSE.

contain a stove, stationary wash-bench, tubs, washing machine, portable clothes-driers; and if a churning power is used, it may be placed in this room, or in the wood-room and be connected by a band or lever or other gearing to churn. If the posts of the building are twelve feet, with seven and a half feet walls below, a nice, large, commodious room may be placed above, and serve an excellent purpose as a workshop for repairs and making tools, doing odd jobs, etc. In this case it will, of

course, have a work-bench, grindstone, a general assortment of common tools, and a lathe, scroll-saw, etc., will be convenient additions. The stairs can run up from any convenient place, say in front of and four feet from the entrance door, for more readily carrying up long sticks, boards, or other timber, as needed. An upper window is useful for taking in long timber. A portion of this chamber may be used as a meal-room, a place for drying clothes during inclement weather, and for a general store-room or catch-all. It may have a bedroom or two for extra help. And last, though not least, place a bell upon the building, protected from the elements by a small belfry, and a rope should connect it with some convenient point in the wood-room. There are steel triangles, now obtained quite cheaply, which answer for bells. So arrange it, that the water may be poured from the tubs and machine direct into the drain, without leaving the room. The wash-room may be used for peeling apples, pitting and drying fruit, trying lard, making soap, and many other important things.

I do not give any estimates, as but few would perhaps build of this exact size; besides being a mere skeleton building, the amount and cost of material is easily obtained. At present prices this building would cost, complete, about one hundred and thirty-five dollars. AGRICULTURAL BUILDER.

Drying Barrow for Stable Bedding.

In cities and villages, often in the country, bedding straw for horses is scarce and high, and quite an item in the expense of keeping. Much of the litter is merely dampened, and if well aired and dried, may be used several times. A simple, convenient

A RACK BARROW.

and effective arrangement for this purpose, is a light wooden frame, placed upon a skeleton wheelbarrow, the handles being about seven feet long. At each corner of the frame a wooden post is placed, twenty inches high. Two inches from the top of each, a nail is driven to support a second light skeleton frame when needed. Wheel the barrow to the stable, and fill the lower frame with the soiled bedding, put on loosely, nearly up to the nails. Then rest the second frame on the nails, throw on the rest of the litter, wheel out into the sunlight for drying and airing, and by night, even that badly soiled, which would otherwise be thrown away, is in good condition. In stormy weather the barrow may be wheeled into some out-building or shed. The stables are thus rendered purer and more healthful. This simple cheap arrangement pays for itself in two months.

Do Trees Increase Rainfall?

GEO. GLENDON, JR., OF VIRGINIA.

An old theory, that dies hard, and is constantly reappearing in our newspapers, is, that "forests increase the rainfall," and that felling forests has been attended with decrease of rain. Statistics from Jamaica have been much used, but do not prove the old theory. The former copious rains there now fall in the sea north of the island, where there are no forests to attract it—resulting perhaps from a change in the Gulf stream. That forests preserve moisture in the soil, and water in the springs; that mountains covered with timber protect lowlands from destructive freshets, is true, and cannot be too strongly impressed on the public, but it is not necessary to mix error with truth, and try to make people believe that by planting a few trees they can change the climate of a whole continent.

In Virginia the drouths for the last ten years and more, are disheartening to farmers, and they talk of the good old times before the war, when seed time and harvest never failed, lamenting the dry seasons that now prevail in the well-wooded mountains, as well as in the low country. Yet, the whole country is growing up to trees, the "old fields" being quickly covered with pines. On my own farm, a field that was in corn eleven years ago, is now an almost impenetrable thicket. Surely if trees affect rainfall the Virginians may well say, "Down with the trees, for they bring drouth!"

We really know but very little about the causes that bring about an increase or diminution in the annual rainfall. Two French philosophers, Fautrat and Sartriaux, found that about one-twelfth more rain fell over a piece of forest than on the adjoining country. This fact went the rounds of the papers as proof that the foliage of trees attracted rain, until it was pointed out that the experiments extended from February to July—about half before the leaves opened, and half afterwards, and that the trees received quite as much rain when entirely bare as when covered with foliage, and even one-sixth more in March when there was no foliage to invite rain or condense the vapor.

A few years ago when spending some time in Utah, I noticed that Great Salt Lake was rising. Some fences, once on dry land, were under water, and the rise of water was said to average one foot a year. The inhabitants said the annual amount of rain was increasing. Some attribute it to the orchards and shade trees they had set out, forgetting that for every tree planted, a hundred or more were cut down on the mountains. Others thought it was due to plowing and cultivation; others were sure that the iron rails of the Pacific Railway brought electricity and rain from the East! A like increase of rain prevailed, and perhaps still prevails in Western Kansas and Nebraska. Forgetting their destructive drouths the papers asserted that rain followed civilization, with its clearing, plowing, and harrowing. This was certainly a pleasant view of the subject to an incoming population, and for those who had lands to sell.

On the contrary, early settlers in Illinois found navigable rivers that are now dried up, or more disconnected puddles. A writer in 1874 says: "Formerly the Fox River was a deep and flowing river all the year round. To-day, and during the drier portions of the last four summers, its vast, deep, and broad bed was, and is, nearly dry." As there were no forests to destroy in Illinois, may not the claim be true that cultivation means drainage, and drying up of the country—the reverse of what is believed to obtain in Western Kansas?

The amount of water which air can hold in solution depends on the temperature. A wind from the Atlantic expands in rising over the land; its temperature consequently falls, and rain is precipitated; going westward, more water falls, until the wind crosses the Rocky Mountains, a dry wind. The winds from the Pacific deposit rain and snow on the low lands, and on the western mountain slopes, passing beyond into Nevada, as dry as air can well be. In crossing the Sierras from Nevada into California, in a wagon, I have been repeatedly struck with the great difference a few miles of country make in the vegetation. Once when crossing into California with a small party of miners, on reaching the summit they all would shout, "see that flower," "see that bush," pointing to well-known Californian plants. Then as we rolled downwards, singing and laughter showed how happy the men were in the home memories suggested by this mountain flora that cannot flourish on the moisture lacking eastern side of the Sierras.

The great Utah Basin, bounded on the east by the Rocky Mountains, is cut off from the Atlantic moisture by the Rockies on the east, and the Pacific's evaporation by the Sierras on the west. The vast tracts lying between the Missouri River and the Rockies, rising slowly but constantly, has necessarily a diminishing rainfall as we go west, and higher. The rise is so gradual as to be imperceptible, but the grasses become shorter, the soil drier, farms and homesteads fewer in number until agri-

culture ceases, except by irrigation, and sheep and cattle graze the short herbage of the unplowed prairies.

To tell men struggling on the border line between tillage and pasture, that setting out trees will alter the climate is to deceive and injure them. A few years of extra rain in the growing season, excite hopes, and grain is sowed, to be certainly followed by years of drouths and ruin. Seasons vary, but our country is laid out in such a way that the intelligent observer may know where he will run the ordinary chances of success or failure depending on the weather, and where, too, he will be surely ruined if he plays a game against nature.

Trees, where they will grow, will protect hillsides from denudation; and the forest soil by holding back water like a sponge, will prevent to a great extent the destructive floods that rush off from a bare mountain, like water from the roof, but that trees bring rain is not proved. Our weather appears to be subject to important changes, far beyond the reach of a forest, or a clover field.

A Rack Hurdle.

The hurdle shown in the engraving is much used in England and other old countries for feeding off clover, vetches, and such crops upon which it is not desirable to have the animals turned while

A FEEDING HURDLE.

eating. The hurdle is placed upon the edge of a field bearing a forage crop, and the animals, usually sheep, graze through the openings. When all the fodder within reach has been eaten the feeding fence is moved forward a few feet to new pasturage. The panels of the hurdle are placed in a leaning position, resting on stays, which may or may not be fixed in the ground. The construction of the hurdle fence is clearly shown by the engraving. A structure of this kind would do good service on many American farms when it is desired to thoroughly feed off a small part of any field.

A New Requirement in Modern Farming.

A good farmer always needed skill, but in the changed conditions of modern farming a different kind of skill is needed from that required by our fathers and grandfathers. This is more largely the case West than East, but true in both. Formerly it was mostly manual skill in the use of simple implements, such as the sickle, the scythe, and the common walking plow. Now the farmer needs to know how to adjust, run, and care for machinery. Machines properly handled call for little manual expertness to run them. But to manage the present implements requires a degree of mechanical skill that a large proportion of our farmers do not possess. To comprehend the full extent of this change, compare the modern threshing-machine with the old-fashioned flail, or the self-binding harvester with the old sickle, or its successor the grain cradle. Every careful observer must recognize the fact that the lack of skill in using and caring for his machinery, is one of the most potent sources of loss to the farmer.

We have known one man to use a mower for ten years, without expending over thirty dollars in repairs—or three dollars annually—while his neighbor, in cutting a smaller quantity of grass used up three equally good machines in the same time. Compare the expenses of this one item: First farmer expended one hundred and thirty dollars,

plus, say seventy dollars for interest—or two hundred dollars in all—for ten years. This is just twenty dollars per annum; quite an item, you will say, for mowing-tools alone, but still much cheaper than mowing with the scythe. The other wore out three machines, three hundred dollars, to which add repairs, say same as the other, thirty dollars, and interest on one hundred dollars for ten years, seventy dollars; on one hundred dollars (the second machine, for six years), forty-two dollars; and on another one hundred dollars (the third machine, for three years), twenty-one dollars, and you have a grand total of four hundred and sixty-three dollars—or forty-six dollars and thirty cents per annum—an annual expense of more than twice as much as the other. The same calculations concerning the harvester, the sulky plow, the hay rake, and other farm implements, make an enormous difference in the cost to the man who is unskillful in using and caring for them. An important inquiry is, how the present difficulty can be remedied.

It cannot be done at once. It will only be done effectually when our farmers' boys are trained to some knowledge of elementary mechanics, either in the public school, or in those established for the purpose. It would now be a paying investment for the farmers in a township to contribute money and hire a skilled mechanic to teach the boys—and men, too, for that matter—the principles and something of the practice of running and keeping in order farm machinery. For illustration, take the mowing machine. There are two points in this needing special attention, viz., the cutting arrangements, the knives and guards, and the parts where the circular motion is converted into reciprocating motion. It is not difficult to teach any one the conditions needed for a shear cut; the section should be sharp, and the corner of the guard against which the grass is pressed to be cut, should be square or sharp. This point once understood, there is little danger of a driver risking the experiment of mowing with a dull knife. The other point is equally important. If there are any loose bearings between the drive wheels and the knives, the power required is much greater, and the danger of breakage, as well as the wear and tear of the machine, will be increased in a much higher ratio. A play of one-sixteenth of an inch in the wrist from where it is connected with the pitman will increase the power required one-fourth. Now in the school suggested, a skilled mechanic could teach, explain and illustrate such points as these until the dullest could not fail to comprehend the difference between a machine in order and one not. It would be easy to make models of those parts of common farm machines where most trouble is met, so arranged as to exhibit to pupils in the most convincing manner the points referred to above.

The difficulty with many farmers is not want of general intelligence, but total ignorance of the simplest mechanical principles. A neighbor once asked the writer to examine a mower which acted strangely. It would go well enough for a while, and then suddenly refuse to cut at all. He was on the point of throwing the machine away and getting a new one. Examination showed the simple difficulty was that the frame was loose, so that when any unusual strain came upon the cutting apparatus, it spread and allowed the cogs to slip past. Ten minutes' time remedied it, and the machine ran for some years afterward. The owner was an intelligent, well-informed man, but had no knowledge of machinery. Our Public Schools may do something in teaching the elements of mechanics to the older boys. It would not be difficult to prepare a little manual which would enable a teacher who himself comprehended the subject, to teach much that would be of the greatest use to these young men. Something may be done also by intelligent farmers in furnishing these boys with a small shop and a few good tools, and on rainy days encourage them to learn their use by making small articles, either for play or profit. Anything which will cultivate the mechanical eye of the young, teach the use of tools, or develop a taste for mechanical employments, is in the right direction. But something must be done. The West cannot afford to

stand the enormous drain on its profits in farming, caused by this needless destruction of farm tools.

Feeding-Box for Cattle or Sheep.

Mr. J. Bartlett, Oshawa, Ont., sends us a sketch and description of a convenient feeding arrangement which has several advantages. We add several suggestions to Mr. B.'s description. It is simple in construction; may be made either stationary or portable; will save much waste of feed usually trampled under foot or soiled; and may

Fig. 1.—A LARGE FEED-BOX.

also protect the feed from rain. It can be used for hay, straw, or roots. If to be stationary, set in the ground four strong posts, *a, a, a, a*, of any available size, or six by six inches. Round timber, hewn straight on two adjacent sides, will answer. They may extend above ground, six, seven, or eight feet. The box may be of any size, but four feet square is a good one, and they can be multiplied to any number needed. If to be portable, the posts will not be set in the ground, but a narrow board nailed a little above the ground will strengthen them, if the top boards are not strong, and firmly nailed on. Feeding boxes may be put on two or four sides. About two and three-quarters to three feet above the ground, nail boards on each side, continuing them to the top. About two feet from the ground, on the inside, place bottom boards slanting upward to the centre at a sharp angle (fig. 2), like a roof—a two-sided one if there are to be two feeding boxes, or a four-sided one if there are to be feeding-boxes on all sides. From the base of these inside boards extend feeding boxes on the outside, as shown at *c, c*. The bottom arrangement, *e*, which will have nine to twelve inch-openings, *d*, will keep the feed sliding down to the animals,

Fig. 2.—SECTION OF FEED-BOX.

or for finer feed and roots may be even narrower than nine inches. A cover, *b*, will protect the feed from rain or snow. This may turn back a little past perpendicular, and be supported by a short bit of chain attached by a spike or staple at one end, and to the side of the box, or by a stake. It may have hinges that will allow it to turn over and down against the outside, but this will require more labor in moving it. It may be simply a loose cover to slide partly off, when placing in feed. If set on with a little inclination, by making one side of the box lower than the opposite one, it will shed rain better. With boxes of this kind, spacious and high enough, two or three days' supply of feed for the cattle may be put in at one time.

Editorial Notes on the Road.

Among the Lumbermen.—The picturesque life and more picturesque scenery in the lumber regions of Michigan and Wisconsin richly repay one for the time spent in reaching them. Machinery and railroads are working great changes in these regions. Formerly logs were floated down rivers to Clinton, Ia., Fond-du-Lac, Wis., and other points, and there converted into timber. Now these logs are largely sawed up in the forests by portable mills, and the lumber is distributed through the country by a net-work of railroads. "Osbkosh and Fond-du-Lac are running down," said a fellow passenger to me, living at the latter place; "small holders have been bought out by large syndicates, who run portable saw-mills in the lumber regions." One capitalist alone, residing in Fond-du-Lac, now owns eighty thousand acres of pine lands in Southern Michigan, near the Wisconsin border. These lumbermen are great characters in their way. Very many of them, in addition to their dark-blue shirts, sport woolen trousers of a fiery red color. They frequently work during the winter months in the pine forests, and act as sailors upon the Lakes during the summer season. The illustration at the top of the page affords a glimpse of logging scenes on the wild Menomonee, which river for some distance constitutes the border line between Wisconsin and Michigan. Several lawyers and other professional gentlemen of Chicago, are accustomed to spend their vacations in this wild region of country. Mr. John Lyle King affords some pleasant sketches of this out-door life in his volume of "Summer Wayfaring in the Northern Wilderness."

Treacherous Quick-sands, and River-bottoms.

—The quick-sands of the Missouri, Platte, and other Western rivers, are nothing, if not exceedingly treacherous and dangerous. Every year many cattle, and some horses and swine "go through," as the expression is, and disappear. Immediately following the fall of the section of the great bridge spanning the Missouri at Omaha, the necessary grappling irons were brought into play for its recovery. But no traces of the missing section could be found. The vast structure had, in a few hours time, sunk in the sands of the river-bottom, beyond all reach or hope of raising. One night, a water-spout carried away the Kansas and Pacific railroad bridge, over the Kiowa Creek, fifty miles this side of Denver. The next train, comprising an engine and freight cars, was precipitated into the quick-sands beneath, killing the engineer. From Lawrence, Kansas, hundreds of miles away, a large gang of laborers were forthwith despatched to the scene of the disaster. When, four months later, I visited the spot, they had fished out the cars, but were still sounding for the engine with poles, which, though of immense length, were not long enough to discover the object of their search. One July morning, Mr. Howard Kennedy and the writer, thought to ford the turgid Platte at Ogallala, Neb., to one of the large cattle drives, stretching for miles over the prairie

south of Ogallala. A daring fellow named Leech led us across the treacherous river, now considerably swollen by recent rains. We rode three Indian ponies, the writer bringing up the rear. The horses plunged boldly in, and were soon struggling with the down current. One-third of the way across, and the water covered our saddle-girths. Kennedy and the writer looked wistfully back, but were cheered on by Leech's assurances that there was no danger if we followed close after him. Soon I could feel my animal sinking. He made three or four steps forward, and then refused, in spite of tongue and whip-lashing, to advance further. Apparently the brute had resigned himself to going down and carrying his rider with him. To my calls for assistance, Leech quickly turned back and with a good deal of dexterous pulling and vigorous English, extracted the animal after all but ears and rump had disappeared under the water. It was a ludicrous and trying scene, but perhaps the most provoking part of all was the unconcern manifested by the animal as to whether he went over or went under. It is unnecessary to add that in recrossing the Platte we closely adhered to the instructions of Leech.

On the Upper Mississippi.—Following the Upper Mississippi northward, from the Falls of St. Anthony, there are very many picturesque and beautiful views. In coming from Brainerd, on the Northern Pacific road, to St. Paul, one constantly catches sight of these views. Abandoned fortifications, dismantled forts, abrupt bluffs, miniature water-falls, afford a constant variety, while prairie and forest add to the ever shifting scene. While the train waited for some little time at a point seventy-five miles north of St. Paul, the artist accompanying the writer hastily sketched the scene presented in the illustration below.

What Makes a Boom?—It is somewhat amusing to observe in new States the solicitude expressed by settlers for good crops, not only for the crops themselves,

Shooting from the Railroad Train.—As we drew near Glendive, on the Yellowstone, one afternoon, the carcasses of several buffalos were strewn along the railroad track. The train in advance of us had suddenly come upon a drove, and for a few moments there was a sharp fusillade from the car windows. While this kind of amusement has not been uncommon in the Territories in the past, it is now of rare occurrence. Less than ten years ago, travellers were accustomed to fire from moving trains at buffalo, in Kansas and Nebraska; now, however, they have entirely disappeared, with the exception of a very few in Western Colorado, and a small herd in the Indian Territory; there are none south of Wyoming and Montana Territories. Unless Congress immediately takes some steps to prevent the wholesale butchery of those remaining in the north, they will very soon be driven into the British Possessions. Every one who does not wish to see buffalo immediately exterminated, should write his representative at Washington on the subject.

Stacks by the Million.—In travelling through the wheat region of Minnesota, we amused ourselves in endeavoring to count the wheat stacks, appearing in rapid succession. As we whirled by one farm after another in our open car, fifteen, twenty, thirty, and even as many as forty stacks would be seen in a single inclosure, presenting indeed a novel sight to an Eastern farmer, accustomed to his single stack or more.

Hands Up and Getting the Drop.—It was the same daring Leech—referred to elsewhere—who for days tracked and followed the band of train robbers over the prairie far down to the Kansas border, after they had secured several hundred thousand dollars of Government specie. The masked robbers brought the Eastern bound train to a dead halt at Ogallala, made all the passengers throw up their hands while they rifled their baggage, secured all the gold being conveyed in the express

car from the Colorado and Utah mines, and then leisurely rode off. There were no soldiers, no organized force to pursue. Leech, whose father was then keeping a tavern at Ogallala, started off after the robbers on his own hook. Day and night, like a sleuth hound, he followed the desperadoes, keeping close on their trail, and one night looked down in their camp while they divided their booty. Soon after they were surrounded and killed, and all the stolen property restored. It was a most exciting story of adventure, as Leech narrated it. A reporter of an Omaha paper, who overheard the recital in the car as Leech was returning eastward

ON THE UPPER MISSISSIPPI.

but for the effect upon the East. For example, all over Nebraska this last autumn one could hear such expressions as, "If the frost will only hold off a few days longer we shall have a big boom in emigration," "If the corn crop holds out as well as it now promises, lots of new people will come in," etc., etc. To-day grasshoppers make a whole region of country unsalable, and send many emigrants back to the East, abandoning their "breakings" or selling them for whatever they may fetch. To-morrow good crops bring a rush of new-comers. Lands appreciate in value, and everybody is happy.

with characteristic rapidity and shrewdness, reproduced from memory in book form in a few days' time the majority of the facts, much to Leech's chagrin. "Hands Up," the title of the volume, sold to the number of fifty thousand in a short time, but with no pecuniary benefit to the hero of the hunt. A year later we suddenly came upon Leech in the large reception room of the depot at Laramie, Wyoming Territory. He was closely watching the movements of a desperate-looking fellow who, to use his own expression, was endeavoring to "Get the drop" on him. The desperado was connected with the Train

Rohbers or Road Agents, as they call them at the far West, whom Leech so successfully trailed a year before. He had repeatedly stated that he should kill Leech, and he was now following him for that purpose. Several times he went around the room watching an opportunity to fire upon Leech and make his escape, but the latter faced him at every turn, and with his hand on the hilt of his revolver, prevented the would-be assassin from taking him at a disadvantage. A few months later, through Leech's efforts, the remainder of these Road Agents were captured in Elk Mountain, and one of them was suspended on a telegraph pole, at Rock Creek, by the captors, on their way back to Laramie. During the following spring Leech came on to New York, and declined all propositions of publishers to prepare a story of his frontier experiences. The last time we heard of him, he was mining in California Gulch, Colorado.

A New Model of Palace Cars.—We hear that three cars are now being constructed at Troy, New York, after a new European model, which may perhaps work quite a revolution in modes of travelling. Instead of being through the centre, the passage-way is at the side of the car. From this passage-way, doors open into the state rooms, which, with adjustable partitions, can be made to meet the requirements of any number of passengers from two to ten. During the day time, meals are served, and at night hammocks or berths are unswung. A gentleman can have his entire family with him in one of these state rooms, and eat and sleep as if at home, though of course in more limited quarters. If this new pattern of travelling cars should take with the public, a company is to be organized for their construction.

Icelanders in America.—One afternoon we came upon a settlement of Icelanders, near Marshall, Lyon County, Western Minnesota. They were represented to us as being excellent, desirable citizens. During the same day we drove past Scandinavian, French and Belgian colonies, and through two entire townships exclusively owned and settled by Low Dutch. Thus it is that peoples of all nationalities from the old world mingle together in the new, and add to the wealth and industries of the States which they populate. They speak different tongues. Their children will all unite in speaking English.

Take Care of Your Credit.—A few years ago Neodesha, beyond the Missouri, borrowed ten thousand dollars for School purposes; when the bonds became due recently, they were not honored, and we have yet to hear that they have been paid. Very great injury has been done in the past to entire regions of the West by acts of this kind. Better that the people of any State which desires emigration should club together and pay off the bonds in such a case as this, rather than that they should go unredeemed. People wonder why Eastern capitalists take three and one-half per cent. for money, when they can loan the same at seven, eight, and ten per cent. in the far West. A single case, however, of town or city repudiation, injures the credit of an entire State, and begets distrust among Eastern capitalists. Furthermore, people moving West do not care to settle in neighborhoods which do not pay their obligations.

Pierre Versus Pierre.—Less than two years ago Pierre, Dakota, was located on the Eastern bank of the Missouri River. Then came other parties who laid out the Pierre Extension, or new Pierre, on the plateau overlooking the first site. Then followed a rivalry between the old town and the new as animated in proportion as that prevailing between St. Paul and Minneapolis. When we were there last autumn the people interested in the new, assured you that the old town would be submerged whenever a heavy flood came, and the people of the old town as confidently asserted that the new town never could and never would amount to anything. Houses were being transferred bodily from one site to the other. A hotel projected on the Flats, and likewise a bank, have been removed bodily to the upper plateau, by owners whose faith is in the new town.

Arkansas Bill Dies.—Last year he repeatedly crossed from the Indian Reservation to Pierre, and fired indiscriminately at the lights in the opera house, and elsewhere. One afternoon he stopped in front of a circus tent, and discharged a half-dozen balls through the canvas. That was a little more than the citizens could put up with, and they sent word across the river to Arkansas Bill, that he never would return alive, if he ventured over again. He however defied the authorities, and again came, declaring that he'd just as soon die then, as at any time. The citizens took him at his word, and, as he touched the shore, riddled his body with seventeen bullets. He had killed a man some months before in the Black Hills, and become a desperado of the worst description. These outlaws, who have long terrorized portions of the Western Territories, are being disposed of, one after another. All the country from the Missouri to the Black Hills, once regarded as so dangerous for travel, is now comparatively safe and secure.

Chat with Readers.

PRESERVING DAHLIA ROOTS.—"Subscriber," Lynn, Mass. —A dry cellar, one which will keep potatoes well through the winter, will preserve Dahlia roots.

THE RED POLLED CATTLE CLUB.—"E. R. H.," Brooklyn The President of the Red Polled Cattle Club is Col. J. B. Mead, Randolph, Vt., who was elected to that office at the late meeting in Chicago, when the club was organized.

SUNFLOWER SEED.—"W. G. C.," Loretto, Pa., asks where he can procure sunflower seed in large quantities, and thinks that such poultry supplies should be advertised. Those who need this seed for horse-medicine or for poultry usually raise it themselves. Probably wholesale seed-houses can supply it by the bushel.

A DOUBLE EGG.—"J. R. Jones," Chanute Kans., writes us, that he found a perfectly developed, hard-shelled egg, within the albumen of another egg, which had a soft shell. The outer egg is quite as large as a turkey's egg. This is a monstrosity of not very rare occurrence. Unusually large eggs are generally double yolked, but occasionally they contain a perfect egg within them.

THE TIME TO CUT CLIONS.—"M. A. J.," Hamilton Co., Ohio.—Clions for grafting, should be cut as soon as the trees from which they are taken are dormant. Experiments show that twigs cut for clions at the end of winter, are much less likely to succeed than those taken as soon as the leaves fall in autumn. Take advantage of the first mild spell, and cut all needed for grafting next spring. No other material is so good for preserving them as fresh sawdust. Sand will do, but it adheres to the clions, and dulls the knife.

MOUSE STAINS.—"J. B. W.," (no date,) asks, "how to remove mouse stains from a woollen garment." The works on scouring say nothing of this kind of stain, and our correspondent must experiment. Clear warm water will remove many stains. This is quite likely to be alkaline, and we should try a weak acid, such as vinegar, or acetic acid, much diluted. If the fabric is white, we should try, after removing all that is possible with water, bleaching, by burning sulphur matches under the spot while it is damp.

THE GERMINATION OF SEEDS.—"H. J. D.," Ocala, Fla. The only recorded experiments to show the time required for the germination of seeds which we now recall, are by a Frenchman, M. Appellus. Such lists are of little value, as the time is greatly influenced by temperature, the amount of moisture in the soil, and especially by the depth to which the seeds are covered. In the list referred to the time given is much longer for some seeds and a great deal shorter for others than is shown by the experience of gardeners in this country.

COMPOST AND QUACK.—"R. B. Reynolds," Columbia Co., N. Y., writes us that he has a large heap of compost, made up of coal ashes, which has been used in earth closets, kitchen garbage, leaves, and other materials that readily decompose. He was about to apply this compost around his fruit trees, currant bushes, etc., but was told, if he did so it would bring in, or "draw Quack," and asks if it is true. "Quack," or Couch Grass, likes a rich soil, and will not flourish on a very poor one. Whatever enriches the soil may encourage weeds, but one manure will not "draw Quack," any more than another.

BERMUDA AND JOHNSON GRASSES.—"J. Gerhart," Lawrence Co., Ill., asks if Johnson-grass and Bermuda-grass are the same, and if it will prevent the after use of the land for ordinary farm crops. The two grasses are about as unlike as they can be. The Johnson-grass is a coarse, tall plant, often six feet or more high, with large tuberous roots, and is raised from seed. The Bermuda grass, on the contrary, is one of the finest of grasses, rarely a foot high. It does not ripen seed in this country, but imported seed is sometimes to be had. The usual method is to cut up the clumps, and plant the cuttings. We advise our correspondent to first experiment with these Southern grasses, before planting them to any extent.

AN ADOBE BARN.—"J. Johnson," Marysville, Kans., is about to build a barn, and is advised to put up one of "adobe," or clay mixed with straw, and asks our opinion as to the material. In Mexico adobe is the common building material. Either large sun-dried bricks are laid, or the material is built up in frames, the same as concrete houses are constructed with us. In Northern Mexico, houses are still standing, so old that all tradition of their building is lost. The climate there, with only a brief rainy season, greatly favors these houses. In Kansas they must contend with both rain and frost. Frost would do no harm if the adobe were dry, and it is probable that an outside coating of cement would protect the material from the rains. We shall be glad to hear from those who have tried adobe buildings in the damper northern climates.

HOW TO KEEP ASHES.—"M. V. L.," Erie Co., N. Y.—Where wood is the chief fuel, disastrous fires often occur from placing the ashes for future use in barrels. A coal of hard-wood, no larger than a hickory nut, will, if covered with ashes, sometimes retain its fire for weeks, so as under favoring circumstances, to start a conflagration. We have made the experiment of burying a small hickory stick partly on fire, in ashes on Wednesday, and on the following Monday, found it a mass of live coal. In cities, where they are less needed, large iron cans are sold. Every country house,

if it has not a brick or other receptacle for ashes, may well have one of these heavy sheet-iron cans. Ashes are worth careful preservation for use upon the farm, and in saving them, it is well to keep in mind, that they may be exceedingly dangerous.

TROUBLED WITH RABBITS.—"C. L. Mason," of Wisconsin, has a farm in Florida. In order to secure a field that was not overrun with rabbits, he purchased a neighboring island, but now finds that this island breeds rabbits faster than he can get rid of them, and comes to us for advice. Are the "rabbits" one of the American hares which do not burrow, or naturalized European rabbits which make runs and nests underground? In Australia, where the true rabbit is a great pest, the most efficacious destructive agent is sulphur fumes. The sulphur is burned in a fumigator, and by means of a pump, the fumes are forced into the runs of the rabbits with deadly effect. If the rabbit in Florida is a true rabbit, it will be well to try sulphur fumes. If it is a hare, this is not practicable. We should then try strychnine, by sprinkling a few grains upon bits of sweet apples or carrots, both of which they are very fond of, and placing these in their paths.

A MACHINE FOR MEASURING DISTANCES.—"P. Butler," Polk Co., Oregon.—The contrivance to attach to the wheel of a vehicle to record the distance travelled, is called an *Odometer*. There are several instruments of the kind, one of which we used a couple of times. It was attached to a spoke near the hub, a weight like the pendulum of a clock always hanging downward by its weight, and every revolution of the wheel, moved a wheel one notch by a ratchet on the weight. The movement of this wheel was recorded on a dial plate outside. You had then only to multiply the circumference of the wheel by the number of revolutions shown on the dial, to know the distance travelled. It acted well until loaned, when a run-away horse smashed it. This we brought from Europe, where it cost one pound, or about five dollars. We presume they are to be obtained of mathematical instrument dealers, and of some dealers in implements, at from six to ten dollars for a common measurer, and more for those of greater accuracy.—We only know of the "Institute" you inquire of, through its advertisements.

"CONTINENTAL TEA."—"NEW JERSEY TEA."—"Mrs. L. D.," Tuckerton, New Jersey, sends us an account of a plant growing in low swampy ground near the sea, which is gathered, dried, and used as "Continental Tea." We do not recognize the plant from her description, and request a specimen. A low shrub, *Ceanothus Americanus*, quite common in the woodlands all over the country, is known as "New Jersey Tea," and was used by our revolutionary grandmothers as a substitute for real tea, which, as Dr. Gray quaintly says, must have been a severe test of their patriotism. Some twenty years ago, it was claimed that real tea had been discovered growing in a Pennsylvania mountain. A company was formed to work up this "tea," and the stock was offered with great claims. We procured a sample of it from head-quarters, and the *American Agriculturist* showed by engravings of the leaves, that it was not real tea, but the old "New Jersey Tea," with a new name. The president of this Tea Company called on us, with threats of prosecution. He was told to go ahead.—We have not since heard of the law suit,—or of that Tea Co.

IMPROVING COMMON FOWLS.—"R. L. King," Holt Co., Mo., asks our opinion of the following. He proposes to take one hundred selected hens from the barn-yard flocks of the vicinity, and place with them four of the very best White Leghorn cocks. The eggs from these hens he proposes to sell to the farmers who keep only common poultry, at an advance over ordinary eggs, but at much less price than is asked for eggs from pure-bred fowls. Mr. E. thinks that this would bring up the standard of common fowls, and show farmers what they might expect from pure-breds. The plan is a doubtful one. The eggs he sells may produce chicks better than the common fowls, and may not. But those who buy the eggs will breed from the birds produced by them, using mongrel cocks with mongrel hens, and the result, in the second generation, is likely to be a very "mixed lot," vastly inferior to the first cross, and probably less desirable than the common fowls. The only way to surely improve ordinary barn-yard fowls is, to continue the use of a pure-bred male with each generation. By the way, twenty-five hens for one male is altogether too many. For breeding purposes ten is quite enough.

HORSE-RADISH FOR MARKET.—"J. A. G.," Manhattan Co., Kans. It is a mistake to treat horse-radish as one would a weed. Many plant it in some low place and let it take care of itself. Properly managed it may be a profitable crop. The secret of success is in allowing it to remain in the ground only one season. Market gardeners usually grow it as a second crop, planting it between the rows of early cabbages. English works advise planting the crowns. Our gardeners know a better way; they plant the "sets," or small roots, half an inch, or less in diameter, and six inches long. The sets can always be bought at the seed stores. They are made from the small roots when the crop is dug; cut square across at the top, and slanting at the bottom, so that in planting they may be set right end up. These having horse-radish already in the ground should dig it the first mild spell. Some erroneously suppose it to be marketable only in spring. In the New York markets it is offered all through the cooler months, and finds buyers. After digging, cut off the side roots and pack in boxes of sand, to prevent drying up. In the markets horse-radish is sold in the grated state; the vendors have very large revolving graters, which are moved by a treadle. Some of the market women use a large, very coarse hand-grater.

Hot Water for Cabbage Worms.—

Dr. Stone, Rutherford, N. J., informs us that he has applied water to his cabbages heated to the temperature recommended (160° F.), and it badly blistered the leaves of his plants, and caused many of them to turn yellow. Probably a lower temperature will kill the worms.

Gambrel or Gammon—Which?—

From childhood up, we have heard and used the word "gambrel," to indicate the stick put through the hind legs of a hog to suspend it in dressing. Recently we saw written and heard the term "gammon stick" instead of gambrel. Turning to the Dictionary, we find: "GAMBREL, the hind leg of a horse," and "GAMMON, noun, the leg of a hog smoked or pickled.... verb, to cure as bacon." The "gammon stick" men seem to have in this case the lexicographers on their side.

Rendering Lard.—

Much lard is injured or spoiled by overheating and burning some portions; the smallest quantity scorched gives a bad flavor to the whole. A hocket of water in the rendering kettle prevents this, if the fire is kept from rising too high around the sides. The water is easily separated at the bottom if not slowly evaporated off during the rendering. Cutting the leaf, etc., fine with a sharp hatchet or cleaver facilitates the free extraction of the lard.

Home Butchering.—

Some prefer to sell all their swine and buy what "hog products" they desire; but as a rule, it is preferable to kill what is needed at home, even when not necessary, as it is on a majority of farms perhaps. One then knows the healthfulness and quality of what he is eating, and with a little experience and skill, farm slaughtering is more economical. The introduction of pulleys and some other simple contrivances, enabling one or two men to handle and dress a considerable number of heavy hogs in a few hours, has, in recent years, done away with the dread and much of the importance of "butchering day."

Putting Down Pork.—

Mr. Stahl writes us thus: Pack closely in the barrel, first rubbing salt well into all exposed ends of bones, and sprinkle well between each layer, using no brine until forty-eight hours after, and then let the brine be strong enough to bear an egg. After six weeks take out the hams and bacon and hang in the smoke-house. When warm weather brings danger of flies, smoke a week with hickory chips, avoiding heating the air much. If one has a dark, close smoke-house, as the writer has, the meat can hang in it all summer; otherwise pack in boxes, putting layers of sweet dry hay between. Long experience has convinced me that this method of packing is preferable to packing in dry salt or ashes.

Sausage Making.—

The quality will depend largely upon the kind of meat or meats used. Cutting or grinding fine is desirable, running twice or more through the machine unless it be a better one than most of those in use. It does not pay to use "skins"; to prepare the intestines thoroughly involves much labor, and they add nothing to the substance or flavor. For early use, press the meat into cakes with the hands, and pack the rest in earthen jars, to be made into cakes as wanted for frying. For long keeping, into summer if desired, make into suitable cakes and fry; pack in jars, and fill these with melted lard. The pieces can be taken out at any time and simply warmed through; they will be as sweet and fresh as when first prepared. Don't spoil sausage meat with spices or mint. Use salt and pepper moderately, leaving every one to apply these freely in eating, as individually desired.

The Power of Roots.—

Instances are not rare in which roots, by their gradual increase in size, have lifted large rocks of several tons weight. Their force, though exerted through a slight space, is nevertheless almost irresistible. In cities and villages, where the Ailanthus is planted as a shade-tree, its scattered seeds fall everywhere, and germinate where there is a little soil or dust. They often fall into areas, and the plants appear in the cracks of pavements, or they lodge in a cavity of the foundation wall, and there soon produce a young

tree, which, in a few years, will be several inches in diameter. We have noticed several instances in New York City in which the roots of these young trees had already thrown the underpinning of buildings visibly out of line, and we occasionally visit a village in which the retaining wall to the terrace in front of a church is visibly disturbed from the same cause. All young trees, whether Ailanthus, elm, or others, springing up in such situations, should be removed while young, before they have caused mischief.

Lord Spencer on Irish Dairying.—

In a speech at an Agricultural Show at Limerick, Lord Spencer said, that during the past ten years domestic animals had increased somewhat, and poultry aggregated nearly two million head. He thought also, that the condition of the poorer class of the people had improved; at the same time, there was enormous room in the country for still greater improvement of them, their agriculture, and live stock breeding. Strenuous efforts have been made, and quite successfully, to increase the dairy products, and better the quality of them, especially in butter. Travelling schools to go about the country have been established for teaching an improved system of dairying, and to show their benefit, the city of Cork market alone the past year had paid the farmers about fifty thousand dollars more for butter than had previously been the case. It is a great satisfaction to us to learn the above, and we hope other and still greater blessings may be in store for this heretofore unhappy country, and make it as nature designed it, one of the most productive and fortunate of the earth.

Lime for Blasting.—

Every one who has slowly added water to a lump of quick-lime, to slake it, has noticed that in combining with water, the lime swells up, and becomes much larger than before. This expansion of quick-lime, when in contact with water, is a force exercised through a short distance, but, like the expansion of water in freezing, is almost irresistible. This force has lately been used in the coal-mines of England, to throw down the coal. To prepare quick-lime for use in blasting, it is first reduced to powder, and then forced into cartridges or cylinders by means of a hydraulic press. A mold two inches across and seven inches long, is filled with powdered lime, and compressed by a hydraulic press of forty-ton power into a solid mass about four inches long. When these cylinders, or cartridges, have lengthwise grooves cut in them to admit water, they are ready for use. Holes are drilled as for blasting with powder, a cylinder of compressed lime is placed in each, and tamped. A tube is provided for in the tamping, and water, by means of a force pump, is forced through the tube, and brought in contact with the lime cartridge. In slaking, the swelling of the lime throws down the coal without any smoke or the liberation of unwholesome gases, and there is no loss of time in getting rid of these. This method of blasting will no doubt find a wider application than for coal-mines.

Sylvan and Northern Hares.—Rabbits.

BY DR. G. A. STOCKWELL.

In the eastern half the United States, two species of Hares, aside from the Swamp and Water varieties, are noteworthy, viz., *Lepus sylvaticus*, which ranges from Central Michigan and Wisconsin to the Gulf of Mexico; and *Lepus americanus*, found in the mountain ranges of Virginia and Pennsylvania, and becoming more abundant northward until it encroaches upon the domain of the Arctic species, *Lepus glacialis*. Though both may become unmitigated nuisances, under certain conditions, yet, within proper bounds, both are desirable, affording happy sport in autumn and winter for youthful trappers and ambitious gunners. Properly prepared, they supply delicious and nourishing food for the table.

Americans are not over exact in using zoological terms, and quite generally call a thrush a "robin," a grouse a "partridge" or "pheasant," a colin a "quail," a stag or wapiti an "elk," an elk a "moose," a hare a "rabbit," etc.—The Rabbit is not found in North or South America, save in a domesticated form. All natives are true hares. —That "All rabbits are hares, but all hares are not rabbits," is true. While both belong to the *Leporidae* family, there is a marked specific dissimilarity. The hare has fur on the soles of its feet, and hairs growing within its mouth; its young, or "leverets," are born perfect in form, amply clothed with fur, have good eyesight, and are able at once to care for themselves in a measure. Hares live in forms (a rude nest of grass or leaves) in depressions or hiding places on the ground, never burrowing beneath it.—The Rabbit, on the contrary, is always a burrower, warmth and concealment being essential for rearing their young, born, as they are, imperfectly developed, helpless, and requiring, during their infancy, care-

ful nursing and a warm bed of fur plucked from the maternal breast. Rabbits have no hairs in the mouth or on the soles of the feet, the latter being defended by pads.

The SYLVAN HARE is usually called the "GRAY RABBIT," probably from its similarity in color and size to the wild rabbit of the Old World (*Lepus Cuniculus*). As its specific name, Sylvan, implies, it is properly an inhabitant of the forest, but it is very susceptible to the benefits of civilization, and spreads northward with the destruction of evergreen forests and the advance of husbandry. It takes especially to open scrub, to borders of cultivated fields, long grass by the sides of ditches and fences, hedge rows, slashings, rocky pastures, and deserted clearings—sometimes it resides in farmyards, hiding under barns, haystacks, wood piles, brush heaps, open stone walls, stump fences, etc. It clings to any residence once chosen, hence is often and unexpectedly found in the heart of large towns or even in the midst of new cities of rapid growth, where abundant shrubbery supplies them with needed concealment.

It is not gregarious; two are seldom seen together except for play. Though several may associate in the same neighborhood, or same frame, for mutual protection and concealment, each pursues its own way. They are nocturnal in habit—restless, and constantly afoot after sunset in pleasant weather, but often move about mornings and evenings, and even at mid-day when it is warm and cloudy. On warm, moonlight nights, a dozen or more are often seen romping, playing games, on a pleasant hillside or grassy knoll, frolicsome as kittens, rolling, tumbling, leaping over each other's backs. They will cover an astonishing amount of ground in a night, but always within a limited area, treading the same ground over and over. The innumerable footprints on a light snow, of even two or three of them, convey the idea that there were scores of them. Their persistent adherence to the same paths or runways makes them an easy prey to trap and snare. In cold, stormy weather, they lay up for a day or two, crouched in their pens, often covered with snow so closely that one not knowing their habits might walk near them for hours without starting one.

As indicated by their long ears, their sense of hearing is very acute; the slightest unaccustomed sound sends them to an erect position, ready to spring away in an instant. Their vision is imperfect, especially for objects in front; the backward inclination of their eyeballs would alone show that their province is to flee from foes rather than to contend with them.—A fleeing hare is always a pretty sight, its long, graceful bounds, covering eight to fourteen feet, outstripping most dogs for a short distance, but lacking in staying power. Their peculiar mode of progress is due to the extraordinary development of their hind limbs and the arrangement of the muscles on the back. The forelegs are short, slender, mere pegs to help support the body when at rest. At each leap the hind legs straddle widely, overlap the forelegs on the ground, the latter being quickly lifted out of the way for another spring. I was much amused at a novice who on first seeing a hare's track said, "The blamed thing is running backward, or else its feet are set wrong." The leaps of some hares are so instantaneous that they appear much like a rubber ball skimming and rebounding over the ground instead of leaping.

The foes of the hare are many—hawks, owls, polecats, weasels, minks, snakes, dogs, and wild and domestic cats. When attacked, it yields passively to its fate. Speed and strategy are its sole defence, and in these it lacks little. No fox is shrewder than an old buck hare, who, when pursued, doubles and twists, now turning aside to let the foe pass on, and then taking the back track, it passes leisurely through form after form of his species to break and confuse the scent. Sometimes when closely pursued he will bolt another hare, take possession of his form, trusting the dog will pursue the fleeing one, guided by his eye rather than his scent. Again, he will take to a hollow tree, and force himself up a yard or more, like a chimney sweep. A young hare usually seeks a burrow or a hollow log at the outset, and ordinarily becomes an easy prey. The doe, however, will fight like a little fury to defend her leverets, though never for her own safety. In defence of her young she has been known to attack and defeat a good-sized black or rattlesnake, leaping over and stamping him with her powerful legs until he was killed or ingloriously fled. The snake vainly strikes his fangs against her thick mantle of hair. The males fight among themselves for possession of the females, making a great fuss by stamping on the ground and leaping at one another, though seldom with more dire results than sheer exhaustion.

When wounded, suddenly seized, or frightened, the hare utters a quick, clear, sharp, wailing sound, like que-a-a-a! que-a-a-a! strikingly like a very young infant. When quite near a place where hares are playing or fighting, one may hear a low, peculiar purring sound. They also stamp the ground violently with their hind feet, producing the peculiar sound known as "drumming."

The Sylvan hare (or gray rabbit) is very prolific, rear-

tender shoots of briars, buds, twigs, etc. They are very destructive to gardens, speedily consuming lettuce, cabbage, carrots, beets, bean plants, etc., and when abundant and driven for food, they tear down the stalks and consume the half ripened kernels in grain fields. They seriously injure young orchards, gnawing and clipping the tender shoots with their sharp incisors as clean as if done with a knife—their work sometimes being charged to neighbors accused of stealing cions for grafting. But hares are unjustly saddled with the depredations of field mice, which quickly ascend the trunks a foot or two before beginning their gnawing the bark, which is then so rapidly done that few suspect them. Against rabbits or mice, a brown or white weasel about, or a tame ferret,

within bounds. Hawks and minks prefer food more easily captured. Cats and dogs are readily taught to capture them, while the judicious use of snares may be a source of revenue as well as amusement to farmers' boys.

The **NORTHERN HARE** prefers evergreen forests, and frequents the dry knolls contiguous to swamps in summer, and the swamps themselves in winter. It is one-third to one-half larger than the Sylvan or Gray hare, and every way more powerful and long winded, more wily and astute, and never seeks concealment beneath the earth; it never troubles the farmer save during winters of extraordinary severity, and is far less prolific. It is less suitable for the table, its food, chiefly evergreen buds and twigs, gives its flesh a well-marked flavor of fir tops. This species is also of a grayish color in summer, assuming more of the leaden hue in autumn, in winter becoming white, or whitish-yellow, mottled with ochreous or tawny spots and blotches. It also runs in a circle when pursued, and once missed by the gunner, it is only necessary to wait patiently for its speedy return. I think their vision is even more imperfect than the Sylvan variety, since on more than one occasion, when closely pursued by the hound, I have known them to dash against intervening obstacles so violently as to cause instant death. Both species are easily killed, a very trifling wound being sufficient to stop one in his headlong career; and both are to be avoided in the

A POOR SHOW FOR "BUNNY."

Drawn (by W. M. Cary) and Engraved for the American Agriculturist.

ing each year three to six litters of five to six leverets each. The only provision made for their young is lining the form roughly with a little dried grass. Their food embraces various fruits, grass and other herbage, the

is a valuable help. The weasel is one of the best abused creatures known, and its labors in destroying mice is beyond computation, while its decided preference for young leverets greatly helps to keep the prolific rabbits

spring, since they are then low in flesh, and apt to harbor disgusting parasites, especially playing the host to the larvæ of a species of oestrus, or gad-fly, that deposits its eggs beneath the skin on either side of the neck.

Building a Stone Fence.

A permanent stone fence should be built from four to five high, two feet wide at the base and one foot at the top, if the kind of stones available allow this construction. If a higher fence is desired, the width should be correspondingly increased. The surface of the soil along the line of the fence should be made smooth and as nearly level as possible. The height will depend upon the situation, the animals, the smoothness of the walls (whether sheep can get foot-holds to climb over), and the character of the ground along each side. If the earth foundation be rounded up previously, sloping off to an open depression or gully, less height will be needed. Such an elevation will furnish a dry base not heaved by frost like a wet one. Without this, or a drain along side or under the wall to keep the soil always dry, the base must be sunk deeply enough to be proof against heavy frosts which will tilt and loosen the best laid wall on wet soil. The foundation stones should be the largest; smaller stones packed between them are necessary to give firmness. The mistake is sometimes made of placing all the larger stones on the outside of the wall, filling the center

LAYING UP A STONE FENCE.

with small ones. Long bind-stones placed at frequent intervals though the wall add greatly to its strength. The top of the fence is most secure when covered with larger, cross-fitting, flat stones. The engraving shows a wooden frame and cords used as a guide in building a substantial stone fence. Two men can work together with mutual advantage on opposite sides of the stone wall.

The Farmer's Most Active Enemy.

PROF. S. R. THOMPSON.

This destroyer of the farmer's hard earned savings is on every farm, in every house, and never leaves us day or night, summer or winter. It damages at midnight, and destroys at noonday. The marks of its teeth may be seen on the pasture fence, it is wasting the barn sills, and pegging away at your sulky plow. Even iron and steel are not exempt from its ravages. The plow comes in from the field bright with use; next week it needs several hours of work and worry to make it scour. You lend your new bright handsaw to a neighbor, who kindly leaves it lying on the grass a night or two, and its condition when returned mars its usefulness, and lessens your faith in human nature. A careless farmer leaves his new mower in the field, or the fence corner until next summer, by which time this fell destroyer has damaged it one-third of its value. The sections are black with rust, the journals are all gummed, and the wood-work is penetrated and weakened in every part.

Those who have read thus far, will have recognized this enemy as rust, rot, or decay, the most active promoter of which is oxygen. This invisible gas forms one-fifth of the entire bulk of the air, and eight-ninths of the weight of all the water on the globe. While of the greatest value in the economy of life, it is also a destructive agent of the most untiring kind. Yet its ravages are easily checked in many instances. A thin covering of some oil will perfectly protect steel and iron from its action. A coat of paint good enough to keep

water from soaking into wood, will protect it from decay almost indefinitely. In the far West, where building is somewhat more expensive than in the East, farmers are disposed to leave their farm-tools out of doors the year round. Such men are making a great mistake. If they are not able to afford shelter for their tools, they can buy a gallon of paint, which, if carefully applied to the wood-work will go a long way towards protecting it from decay. It is certain that if the farmers of any State would expend one thousand dollars for paint next year for this purpose, they would save ten thousand now likely to be utterly lost. If any one thinks this overstated, let him look around among his neighbors, and see the hundreds and hundreds of dollars' worth of machinery that is going to ruin from decay, which a little paint would prevent. Here at least in the protection of farm implements a penny saved is as good as a penny earned.

Wheat as a Staple Crop in New England.

According to the latest definite statistics (the last Census), no State exceeded Connecticut in the average yield per acre of wheat, except Colorado, where the average was twenty-two bushels, against nineteen bushels in Connecticut and about the same in Indiana, Michigan, and Wyoming Territory. Ohio came next with eighteen, Oregon, Vermont, and Illinois followed with seventeen; California and Utah with sixteen; New Hampshire, Maine, Massachusetts match Pennsylvania with fifteen; and Rhode Island equals New York with fourteen bushels. So we have all the New England States among the highest sixteen; Connecticut and Vermont among the highest eight. Colorado's exceptional large average teaches a practical lesson. It was due no doubt to the extensive irrigation

secured by damming her mountain streams, and turning the waters over the dry but rich land. Two or three irrigations in addition to the natural rainfall secures almost uniformly a remunerative crop. Most of the streams of New England are so appropriated to manufacturing that we cannot expect to raise wheat largely upon irrigated acres, however profitable, though multitudes of small streams might be turned to good account. The average for the entire six New England States, nearly sixteen bushels per acre, surpasses that of rye, and the grain is worth at least a third more per bushel in the local markets. It is manifest that there is nothing in the soil or climate to prevent successful wheat growing. In the valley of the Connecticut River, wheat is grown to a considerable extent in rotation with tobacco. The small tobacco plots of one to three acres receive the bulk of the manure made on the farm and considerable additions of concentrated fertilizers, for years in succession. Wheat sown upon such land is almost uniformly successful, yielding twenty-five to thirty-five bushels to the acre, according to the fertility and fine tilth of the soil. One of the few good things that can be said of tobacco is that it compels manuring highly, and thorough cultivation, to secure a remunerative crop. The manure, the fine tilth, and freedom from weeds are just the treatment needed for successful wheat growing. The conditions can be supplied on most New England farms, and at least wheat enough be grown for the family. The soil selected should be well drained, and in good heart. A wet subsoil, where water is thrown on the surface in heavy rains, and there is much freezing and thawing in winter and spring, is death to the crop. If the soil is not rich, it must be made so, either by turning in green crops, or by applying fertilizers. A clover crop turned under is one of the best preparations for wheat. The seed-bed should be made very fine by plowing and harrowing, and part of the manure should be kept near the surface to stimulate growth before winter sets in. Clean seed, sowing

while the soil is moist, etc., are important items with this crop. With suitable attention to details, wheat can be profitably grown in all New England.

Water Troughs.—Stone and Plank.

Referring to the stone tank in the November *American Agriculturist*, Mr. D. Z. Evans, Jr., Ger-

mantown, Pa., sends us a sketch (see engraving above) having the sides much inclined outward, and less likely to be broken by freezing in cold locations, whether of stone or wood. He recommends having the sides and bottom slightly grooved where they are to receive the end pieces, and edges of the base. Then before drawing together with the iron rods, which have large heads on one end and nuts and screws on the other, insert strips of good rubber in all the joints. The rubber packing, if fitting closely in all its joinings, will make tight joints, and last at least a year or two before needing renewing. For plank troughs, fit the joints closely with saw, plane and chisel, and apply in the joints before closing them, thick white lead ground in oil, which in a week or two will harden so as to prevent any leakage of water from the trough.

Barn Flooring.

BY L. D. SNOOK.

A barn floor needs to be strong to sustain heavy loads, with close fitting joints, to prevent grain, etc., dropping through. For the driveway, plank of pine,

Fig. 1.—(END VIEWS.)

hemlock, or other soft wood is preferable for the teams, as oak or other wood gives a less secure foothold. They should always be laid crosswise, not only to give a better foothold for the team,

Fig. 2.

but to distribute the weight of the load over a greater number of planks. The supporting joists should never be over two feet from center to center, better only sixteen or eighteen inches. They

Fig. 3.

should be made as level and quite as carefully fitted as for house flooring, and not less than two inches thick; two and a half inches would be better, especially along driveways. The width depends first

Fig. 4.

upon what is obtainable, and next upon the seasoning. If perfectly dry when laid, they may be of the full width even if two feet wide, but if not thoroughly seasoned eight inches wide will

Fig. 5.

be sufficient. They should be cut a year in advance and so well seasoned as to shrink but little. The simplest way to make barn floor is to tongue and groove the plank as in figure 1;

or as in figure 2, cut out the lower corner of each end of the plank half an inch back and one inch deep, and as each plank is laid, put an inch strip in the groove, the next plank fully covering the strip. You thus obtain the benefits of a grooved floor, without danger of breaking away the tongue by unequal pressure from above. Fig. 3. is similar, though much cheaper, one edge of the plank simply overlaps the one below, making a firm, strong joint. In figure 4, both edges are grooved for a tongue of some hard-wood, these making a firm joint.

Where the ends of plank meet, a lock joint similar to figure 5, is quickly made, which keeps them from becoming unequally elevated. Many mechanics spike the floor down as fast as laid, but it is always best when practicable, to postpone nailing until just before fall rains, when the plank are dry and can be driven together by wooden wedges on one side. Flooring should be as free as possible from knots in the planks or other imperfections.

A Creamery Refrigerator.

BY J. N. MUNCY, ASSISTANT IN EXPERIMENTS, STATE AGRICULTURAL COLLEGE, AMES, IOWA.

A refrigerator was built for the Agricultural College Creamery in June. It is five feet four inches by five feet ten inches, and nine and a half feet

SECTION OF REFRIGERATOR.

high. The following is a detailed account of the cost of materials and labor at the prices current here:

600 ft. No. 2 flooring, \$18.00;	152 ft. 4-in. ceiling, \$1.55;	\$22.55
14 pieces, 2 by 4 by 20.		3.75
90 ft. 3/4 clear.		3.15
731 lbs. charcoal—35 7-10 bus.		6.90
Shellac varnish, for inside.		6.65
16 lbs. zinc, for lower ice tray.		1.60
29 lbs. galvanized iron, for upper ice tray.		3.48
Nails, 70; Prepared paint, \$2.00.		2.70
2 lbs. No. 25 galvanized iron.		.24
Mortise latch and knob.		.80
2 prs. wrought iron loose pin butts.		.50
2 lights glass, 14 by 20, @ 35c.		.70
Tinner's work, 5 hours.		1.50
97 hours carpenter work.		24.25
Estimated time, painting, 10 hours.		1.25

Total.....\$80.02

The lower tray catches the condensed water from the upper one. If there is but one tray, this water is continually dropping on the creamery floor. The zinc on the lower tray is in direct contact with the wood. The upper tray rests on inch strips, which are in direct contact with the zinc of the lower tray. The distance from the upper tray to the top of the refrigerator is two feet four inches. This leaves space enough for about one thousand three hundred pounds of ice. Charcoal is a most excellent non-conductor, and does not hasten the decay of the wood with which it is in contact. Paint would be a good substitute for shellac var-

nish. This, with other changes that might be made, would decrease the cost considerably. The air in the refrigerator is dry enough to keep matches for two days, after which the wood has absorbed sufficient moisture to prevent burning. From July 26 to August 14, two thousand three hundred and eighty pounds of ice were used in this refrigerator, and the average daily temperature of the air was fifty-four degrees Fahrenheit.

Summer vs. Winter Feeding of Pigs.

As feeding corn to pigs in cold weather is usually done at a loss, it is important to do as much feeding as possible in warm weather. The following experiment, made by Mr. M. L. Lester, of Lancaster Co., Neb., furnishes some interesting facts in this direction. Feb. 1st, 1882, he had ninety-five pigs, ranging from forty to one hundred and sixty lbs. in weight, averaging one hundred and three lbs. He weighed the pigs monthly, and kept an accurate account of the corn fed, with the following results:

INCREASE IN LIVE WEIGHT PER BUSHEL OF CORN FED.

February, 1882.....	9 1/2 lbs.	July.....	7 1/2 lbs.
March.....	11 1/2 lbs.	Aug. 1, to Aug. 10.....	13 lbs.
Apr. 1, to Apr. 15.....	7 1/2 lbs.	Aug. 11 to Nov. 30.....	Average per month 14 lbs.
Apr. 16 to Apr. 30.....	18 lbs.	December.....	13 lbs.
May.....	14 lbs.		
Average for Year.....	11 3/4 lbs.		

Now note that from Feb. 1st, to April 10th, the hogs had nothing but corn, and the gain per bushel ranged from seven and two-thirds to eleven and a half lbs. per bushel of corn. April 17th they were turned on a field of rye, and for the rest of the month made eighteen pounds of pork from a bushel of corn. During May, though the sows were dropping their pigs, the gain kept up to fourteen lbs. per bushel. There was small gain in June, due to two causes. The pigs (not weighed July 1st), were pulling down the weight of their dams, and the rye had become so tough that the pigs did not eat it well. As soon as the young corn was old enough to feed, the gain per bushel rose again to a paying rate, and continued well into the winter, some time in fact after the green feed was all gone. Indeed, it is a common result that the good effect of plenty of green feed continues in the thrift of pigs, for some time after its feeding has ceased.

A Convenient Corn Pen.

We find a temporary corn pen convenient in the lot for fattening swine. This pen holds only enough corn for a few days' feeding, the corn being hauled to it from the storage pens, or directly from the field as it is needed. Our pen holds about one hundred bushels, but pens can easily be built to hold three times as much. The pen should be built in the center of the lot, with a feeding floor around it. The corn is thrown to the hogs by hand. The hogs can pass under the pen and pick up any shelled corn which may drop from above. The pen affords no harbor for rats and mice, and the corn does not gather moisture from below and mould. The air passes freely around, under and over the corn, and this soon dries it. The hogs can not get at the corn, and do not worry off their flesh reaching after ears. The pen is useful the year round, though its greatest value is during fall and winter. We have continuously used this pen in our feed lots for more than twenty years, and can highly recommend it to others.

The manner of constructing this convenient pen for feeding corn is as follows: Four forked posts are set in the ground at the corners of a square, the sides of which are nine feet long. Two poles are laid in the forks of these posts, parallel to each other, three and one-half feet from the ground. On these poles the floor of plank or rails is laid. The sides of the pen are built up of rails, like a log-house, until the pen is of the desired height. The posts should be at least eight inches in diameter at the base, with strong forks. This is a very cheap pen, which will last until the posts, upon which it stands, rot away. J. M. S.

Good and Cheap Slat Fence.

Most trees of fair size will furnish one or more three-and-a-half to four feet cuts of good timber, straight grained enough to be worked up in a saw-mill into slats one inch thick by two or three wide, with the aid of the bench shown in figures 1 and 2. These slats can be rapidly woven into a useful and valuable fence, like that shown by the several sketches presented below.

The wire should be a little larger than that used on harvesting machines and tough like it. The bench of which fig. 1 is a side view, and fig. 2 a top view, should be about sixteen feet long and have a screw at each corner for raising and lower-

Fig. 1.—SIDE OF BENCH.

ing the holding bars. For the screws, at the ends of the frame, one-half to three-fourth-inch iron rod will answer. The wire is twisted close and tight to the slats and given two or three twists between them. If the slats are green stuff, we fasten the wire to them with small staples to prevent their slipping when they shrink. The fence is fastened to the posts with common fence staples. In building the fence shown below in figure 3, we first fasten the lower stiffening wire to the posts, then the par-

Fig. 2.—TOP OF BENCH.

cels of slat fence, and finish with the upper wire. Such a fence will last many years, and for most sections of the country is the best and cheapest combined cattle and hog fence that can be made. For a garden fence it is equal to the best picket, and at one third of the cost. By having the slats sawed about one-half-inch thick, two inches wide, and five to six feet long, it makes an excellent fence for a chicken yard, as it can be readily taken down, moved, and put up again without injuring it in the least. For this purpose a single stiffening wire near the top is all that is necessary. We have seen this

Fig. 3.—PORTION OF THE FENCE.

fence made by having one wire, generally a fence wire, running through holes bored through the slats and a smaller wire wound about them to hold them in place; but the hole in the slats is objectionable as it causes the slat to rot rapidly at that spot.

Tramps and the Farmers.

O most people there is always something humorous about a tramp. His grotesque rags, his queer shifts to protract his worthless existence, his absolute indifference to all the conventionalisms of decent society, render him a curious object to people not coming into too intimate contact with him.

But the farmer knows the tramp to his sorrow. The vagabond, in the city a mere caricature of humanity, provoking as much amusement as contempt, is in the country as veritable a pest, though not quite so destructive as locusts, grasshoppers or potato bugs. "I'd rather see an Army-worm than a tramp," said a Long Island farmer to us last summer. "Because, you see, I can kill an army-worm." He looked as if he could have killed a tramp, too, but for his reverence for law. Others similarly afflicted will excuse his desperation.

Within a hundred miles around any great city, the tramp most abounds. Apparently a city production, he only goes upon his wanderings when his home quarters become too warm for him. Summer is his favorite season for travel, but in the bitterest weather specimens of him wander over the snow-covered land, apparently as insensible to the elements as he is to sobriety and soap and water.

Exactly what are his ideas of existence, no one has ever been able to define. Although idleness and contempt for decency are his own paramount virtues, he can not regard them as virtues in others: if all others were like him he would starve. We once asked a burly tramp by the roadside, who desired to share our lunch, why he did not go to work.—"Why should I go to work?" said he; "there's so many working now that wages is getting lower every year." This fellow was a type of perhaps the least offensive class of tramps. He belonged to the humorous order. He was plump, well-fed, and had a round, greasy face, with a perpetual smile struggling through his stubby beard, and a broad grin disclosing his tobacco-stained teeth. He wore the remains of a pair of very "loud" tweed pantaloons, what was left of an old hunting jacket, and a far-

picture of such self-satisfaction, that we willingly added a dime for the privilege of sketching him.

The Clerical tramp is another of the less objectionable of his kind. He has a strong ministerial leaning in his costume. His shiny coat, once black, pinued under his chin, has always a dirty wisp of paper collar visible over it—about the closest approach to a shirt the clerical tramp ever makes. His old carpet-bag looks as if it had once held dynamite and suffered an explosion, and his cane is an old umbrella stick. He rubs his hands together as he talks to you, his voice a whine like that of a beggar at a London street crossing. The worst about the clerical tramp is his hypocrisy. He

The Idiot tramp is a familiar figure in the rural districts. Pity and amusement combine to render him welcome almost everywhere. It is a trait of our common humanity that the poorest and most selfish of us have still sympathy and respect to spare for that most dreadful affliction to mankind.

Who does not recall some specimen of that most horrible of living creatures, the Female tramp, bundled in her filthy rags, with her shameful old face leering from under dirty gray hair, tied around with a rag of a handkerchief? Who does not know her greasy and dirt-besmeared old basket on her arm, holding always, if nothing else, a bottle. She is as revolting as the ruffian tramp is menacing. She

THE BOY, THE FEMALE, AND THE RUFFIAN TRAMP.

would be amusing if such a worthless creature did not make religion a cloak for his degradation. The humorous tramp never tells you anything about himself. He cracks jokes and utters funny sayings, earning his bite and sup by putting you in a good humor. But the clerical tramp always disgusts you by unfolding a doleful history of himself, appealing to your pity, not to your good nature.

Another tramp makes the same appeal, though in a different way. The Boy tramp is one of the most painful manifestations of modern recklessness and misery. There are altogether too many of them

never begs, not she. What she wants she asks for, and if she does not get it, it takes a thick wall and a deaf ear to save you from her flood of oburgation.

Generally, it is probably safe to assume that all tramps are thieves. The lives they live do not tend to render them particularly sensitive to moral admonitions from within, when they see a full clothes-line or a stray fowl near their stick. Their extensive depredations often fall on those least able to sustain them. They cost the farmer and his wife many a dollar's loss, and in many a way.

But the Ruffian tramp is the only one really dangerous to the person and pocket of the community. He exists in every variety. You find him big and brutal, little and sneaking, bullying or sullen, according to his temperament. But in all cases he is a depraved, vicious scoundrel, absolutely with no redeeming trait, and of whom the earth would be well rid. This miscreant has recently so increased in numbers and in insolence that he has become a perfect curse upon rural communities. In certain sections these modern bandits camp in squadrons, and levy on the neighborhood for supplies, like an army in an enemy's country. Not content with this, they wantonly destroy what they cannot use. A terror to women and children, a burden on men who labor honestly for their livings, an outrage on society itself, their existence can only be regarded like that of all creatures of prey as one of the inscrutable mysteries of nature.

THE HUMOROUS, THE CLERICAL, AND THE IDIOT TRAMP.

gone velvet vest over an old red flannel undershirt. The ruin of a once jaunty Derby was coaxed over his eye. A big bunch of daisies flourished in his buttonhole, and he had a bundle done up in an old bandanna. As he leaned on his stick, and poised in his hand the sandwich we gave him, he was a

wandering about, gaining your compassion and hospitality with a pitiful story of a cruel parent, and learning, in his wandering, lessons of precocious wickedness, horrible to reflect upon. Bad companions and, more than all, bad literature, are constantly adding to the already large army of boy tramps.

THERE are two things of which the gardener rarely has an excess—leaves and manure—the former often helping to increase the quantity of the latter. For covering plants of all kinds during the winter, leaves, nature's own covering, are especially fitted. A hot bed is much more lasting and more under control, if the manure is mixed with one-third or one half its bulk of leaves. Used as bedding for horse or cow, they absorb the liquids, and when they are added to the manure heap, they soon decompose and increase its value. It is well to gather the leaves from the lawn and road-sides as they fall, before they are scattered by the winds. Those in the woods may be left until later.

Hoose in Calves, Etc.

BY PROF. D. D. SLADE, M. D., V. S., HARVARD UNIVERSITY, CAMBRIDGE, MASS.

Mr. J. Hodson, writing from Marshfield, Coos Co., Oregon, under date of Oct. 13, 1883, asks the opinion of the *American Agriculturist* in regard to the nature and treatment of a disease which has attacked the calves upon Coos River, proving very fatal upon some farms, notably on that of Mr. N. Small, where sixty-three out of sixty-five calves were attacked. He says the symptoms are as follows: "The calf will get up and cough and appear very tired, will gasp for breath, run its tongue out and low and moan in great distress;

ing air cells, mature, and in time reproduce their kind. In the second case the impregnated female being expelled from the air passages by the coughing, falls either upon the ground or into water, dies, and the eggs remain for an indefinite period, until under favorable circumstances they are taken up with the food or water into the body of a suitable host, either as eggs or as minute worms. These are then conveyed by the circulation of the blood from the stomach and intestines, and are deposited in the tissues of the lungs, whence, after a certain period, they pierce a passage into the bronchial tubes. While occupying the lung tissue, they are incased in small masses which appear like chalky matter, and which the microscope shows to be de-

As prevention is better than cure it is highly important that this parasitical disease should be stamped out in newly infested countries, which may be done by the separation of the affected animals, by their continuous medical treatment, and by the burning or very deep interment of the bodies that die from it. No calves or foals should be pastured on lands which have been occupied by older stock of the same kind, nor should they have access to the same food or water. Drain the infected lands where possible, and make no use of any fodder, grain or other produce from such localities, for cattle, horses or mules. Any animals that have been exposed must have a liberal diet, including dry grain, roots, etc., plenty of salt, and must be carefully

THE TRAMPS "IN CLOVER." — (See page 20.)

Drawn by Alfred Trumble, and Engraved for the American Agriculturist.

running down in flesh all the time, and dying in from ten to fourteen days. Upon post mortem examination by doctors here, thousands of white worms an inch or so in length were found in the bronchial tubes and their branches into the lungs."

The disease in question is recognized under various names, as Hoose, Husa, Verminous Bronchitis, etc., and is due to the presence of innumerable white worms from one-half inch to three inches in length, an animal parasite known by naturalists as the *Strongylus micrurus*. These particular internal parasites are long, slender, cylindrical in shape, with heads in some of the orders armed with hooks or spines. They infest the bodies of the sheep, goat, calf, horse, ass, mule, pig, and even birds. They inhabit the air passages and lungs, as also the digestive organs, and may be reproduced either within or without the body. In the first case the female worm gets access to an air cell, where, becoming encysted, it produces eggs; the young worms from there creep into neighbor-

posits of the eggs and young worms. The presence of these bodies create an irritation, and give rise to an inflammation of the lung tissue, resembling the disease known as lung fever or pneumonia. When the worms are present in the air passages, they create constant irritation, and violent coughing is induced, during which the parasites are often expelled in masses with the mucus. The symptoms of the disease which first call attention are, the slight husky cough at irregular intervals, the dry and loose coat, the loss of appetite and want of energy, and gradual emaciation. The cough soon becomes more troublesome and even at times suffocating, with the expectoration of mucus and worms. The animal grows weaker, the skin becomes hide-bound, various dropsical swellings may occur, and great constitutional disturbances arise, terminating fatally in ten to fifteen days. Intestinal parasites may also at the same time co-exist, and produce diarrhoea, and grave disturbances of the bowels of the infested animal.

watched for the first symptoms of the disease. To destroy the lung parasites, bring the affected animals together in a close building, and subject them to the fumes of the flowers of sulphur thrown in small quantity at a time upon a heated shovel or iron plate, or by means of any simple apparatus, until the chamber is as much charged with the fumes as the animals can bear without too severe coughing. This should be done for several days in succession, and at intervals afterwards as long as there is any suspicion of the presence of the parasites, and should be kept up for twenty minutes to half an hour. Of course the affected ones are not to mingle with others, or go into new pastures which they might infect. A liberal and nutritious diet is necessary, to which may be added vegetable and ferruginous tonics, such as powdered gentian, sulphate of iron, etc. The intestinal parasites may be destroyed by giving the animal infested with them a tablespoonful of oil of turpentine in gruel or milk in the morning before feeding.

Two New Blackberries—"Early Cluster," "Wilson Junior."

It is several years since any varieties of real value have been added to our list of improved blackberries; but this year brings us two new ones, which promise to be of great importance to fruit growers. Early in June last, John S. Collins, of Moorestown, N. J., sent us specimens of the "Early Cluster" Blackberry. Through the neglect of the expressmen, these arrived in a condition unfit for testing, and only allowing us to judge of their size and shape. Like most of our cultivated blackberries, this was an accidental seedling. The claims made for the Early Cluster are: healthfulness and vigor of plant, great productiveness, earliness, and superior quality. The absence of double and imperfect flowers, common in the "Early Wilson" and some others, allowing each flower to produce a berry, conduces to its bearing qualities. The discoverer states that from a single stool, thirteen quarts of berries were taken at one picking. The engraving represents the size of the berry, which does not average quite so large as the "Early Wilson," but is of much better quality, on account of the absence of a hard core. The "Early Cluster" is being planted largely for market, and it promises to be a valuable berry.

The choicest blackberries are so generally accidental seedlings, that it is a novelty to find an exception. William Parry, Parry, N. J., has for many years experimented in growing blackberries from seed. Being a firm believer in the value of inherited good qualities, or "pedigree," in fruits as well as in trotting horses and butter-making cows, he selected the finest and largest berries from the healthiest and most productive plants of the "Wilson Early," which he regarded as the best variety then known. Out of hundreds of seedlings, one was selected as the most desirable to propagate, and this is known as "Wilson Junior." It is claimed that this seedling has all the good qualities of its parent, to which others are added. The size is unusual,

THE "WILSON JUNIOR" BLACKBERRY.

selected berries measuring three and a quarter inches around at their smallest diameter, or crosswise. It is also claimed to be earlier, more productive, sweet as soon as black, to carry well, and to hold its bright color an unusually long time,

The blackberry has now become such an important market fruit, that we welcome with interest any variety which promises to be an improvement upon the established kinds. Of course with these, as with all new fruits that we have not been able to cultivate and test, we give the claims of those interested in their production. In these instances, both parties have been largely engaged in growing fruit, are thoroughly acquainted with the re-

tilating on mild days. For excessive dryness, of course water is the remedy. The pots, especially towards spring, should be examined occasionally, and those in danger of becoming "killing dry," sparingly supplied with water.

"Kill-Calf." (*Leucothoe racemosa*.)

Several of our native shrubs have the reputation

THE "EARLY CLUSTER" BLACKBERRY.

quirements of a market fruit, and they of course know, as few others can, in what respects the old varieties fell short of being perfect market berries.

Keeping Apples in Winter.

It is one thing to raise fair, sound, winter apples of the best varieties, and quite another to keep them so that they will come out in April as crisp and toothsome as in mid-winter. And it is not too late to attend to those still kept in the cellar or elsewhere. To be sure of soundness, with no worm inside, or blotch upon the skin, is a prime necessity for good and long preservation. A fruit room of course will keep them well, other conditions being all right, but the average farmer who sold all his surplus apples in autumn, and only wants a few barrels for his dessert and evening callers, has no suitable place but his cellar, and his handiest vessel is the second-hand barrel. Let the barrel then be sound, with two good heads and perfectly clean—nothing upon the inside to start rot. At the last assorting remove every defective and bruised apple for early use, and leave no hole or crack in the headed barrel. This helps to preserve an even temperature. If kept in a cellar, let the barrel rest upon the bilge, and not upon the head, and keep dry. The cellar should have a door or window, opening easily to give more or less air, according to the outer temperature. With this convenience and a thermometer, one can keep the temperature between thirty-two and forty degrees, and have fine apples in spring. Nothing but watching them faithfully will do it.

A CELLAR without a furnace, is an important adjunct to a garden, as it allows a number of half hardy plants to be kept over the winter. But those in the cellar must not be entirely neglected. They are liable to suffer from a too moist atmosphere, which may cause the stems to become mouldy, or the earth in the pots may become so dry that the roots will shrivel and perish. The first trouble, the moist air, may be avoided by ven-

of being poisonous to domestic animals. These do not belong to plant families known to be poisonous, nor are they injurious to man, yet the testimony as to their deleterious effects upon animals is too general to be ignored. The poisonous effects of the Low Laurel (*Kalmia angustifolia*) are so extensively recognized as to give it the common names, "Sheep Laurel" and "Lambkill;" and the "Mountain Laurel" (*Kalmia latifolia*) has a similar reputation. In parts of New Jersey, another shrub of the same family with the Laurels is called "Kill-

THE "KILL-CALF."

ealf," on account of its effects upon calves that eat it. Mrs. L. Blackman, of Burlington Co., N. J., writes us: "I have seen many a poor calf roll up its eyes and die in consequence of having eaten 'Kill-calf,' which is a deadly poison." The plant with this unpleasant reputation is one of our most ornamental native shrubs, *Leucothoe racemosa*. It was formerly called *Andromeda racemosa*, but when, for good botanical reasons, the large genus, *Andromeda*, was divided, this fell to *Leucothoe*, a name from ancient mythology. The shrub has a general resemblance to a high huckleberry bush, usually four to six feet high, but sometimes reaching ten feet. The engraving shows the shape of its decid-

uous leaves, and its strikingly beautiful clusters of flowers. These clusters, which terminate the small branches, have pure white flowers, pointing directly downwards. So regular are the flowers, that they have been compared to rows of teeth. It blooms in June, and is common near the coast, from Massachusetts southward. As an ornamental shrub, it has positive merits and is worthy of a place among the choice exotics. Its poisonous effects upon calves are not mentioned in the books, but seem to be well recognized by the farmers of New Jersey. Mrs. B. states that among farmers in her vicinity the common remedy for calves is warm milk, sweetened with molasses. This usually causes the animal to vomit, and it is relieved. Our correspondent thinks that lambs sometimes eat the "Kill-calf," when it is certain death to them. The subject of animal poisoning is an important one to farmers, and we shall be glad of any testimony bearing upon the deleterious qualities of any plants.

The Hornbeam and Ironwood.

When a farmer's boy at the wood-pile comes across a stick which resists his efforts to split it,

THE HORNBEAM (*Carpinus Americana*).

he throws it aside, with the epithet, "Hornbeam." He may be right, or may not, as there are other woods equally difficult to split. The term "Hornbeam," is applied to two very different trees. One, closely related to the European tree of that name, is properly called Hornbeam; the other should be known as Hop Hornbeam, or Ironwood. Both are related to the Beech and Oak, though differing in their fruit. The Hornbeam (*Carpinus Americana*), frequently called "Blue Beech," especially in the Western States, is often scarcely more than a large shrub, though occasionally rising to thirty feet. Its close gray bark somewhat resembles that of the Beech; the tree is readily recognized by its ridged or fluted trunk, which is unlike that of any other of our native trees. As in the Beech, the sterile and fertile flowers are in different clusters. The sterile flowers in drooping catkins, soon fall away; the fertile ones form fruit like that shown in the engraving. A little nut is at the base of a leafy bract. The engraving also gives the shape of the leaves. The wood of the Hornbeam is white, very hard, and close-grained, and on account of its toughness is used for heetles, levers, or wherever a very serviceable wood is required; it is sometimes used for hoops. The nearly related European Hornbeam makes a useful screen or wind-break, and the American species would no doubt serve for the same purpose. The Hop Hornbeam or Ironwood, (*Ostrya Virginica*) is often confounded with the preceding. It is a larger tree, forty feet high or more, with leaves much like those of the Black

Birch, and its fruit in catkins closely resembles those of the hop, whence its most common name, Hop Hornbeam. These clusters, sometimes three inches long, with the appearance of a hop, consist of closed bags, each of which contains a little nut. The tree is found from Canada, far southward, and is known in different localities as "Lever-wood," "Ironwood," and among the French settlers in Canada, is *Boisdur*, or "Hard-wood." The wood is very white, compact and heavy, and is used for heetles, mallets, and in mill machinery. The tree has merits which commend it for ornamental planting, on account of its light and graceful spray.

Why Not More Chrysanthemums?

For some reason Chrysanthemums have not acquired the popularity in this country which they have abroad. They have much to commend them in their great variety in size, form and color, ease of culture, and in their coming at a time when most other flowers have gone into winter quarters. In England, nearly every

plants, shading them for a few days until they recover, and do not take them into the house until there is danger of severe frost. A window in a room without fire will greatly prolong the season of bloom. When their beauty is past, cut back the stems and place the pots in the cellar, where the earth should not become too dry. Those who exhibit Chrysanthemums, train them in various forms, tree-like, pyramidal, and tabular. The plant readily yields itself to the cutting and pinching necessary to produce these specimens. Specially large exhibition flowers are produced by growing a plant to a single stem, and allowing this to bear but two or three flowers, all the other buds being removed. In producing the trained specimens, the pinching hack must be done while the plant is making its growth, and the desired form given before the buds appear. When the Chrysanthemum is grown in the open garden and allowed to flower there, it should be tied to stakes, as the stems are

THE HOP HORNBEAM (*Ostrya Virginica*).

large town has its special Chrysanthemum show, held usually by a society devoted solely to the culture and exhibition of this flower. The New York Horticultural Society did well to hold a special Chrysanthemum exhibition in October last, as it served to show what a great variety is now presented by the forms of this one flower. As an indication of its increasing popularity, we notice that florists offer, and ladies wear upon the street, "corsage bouquets" of the Chrysanthemum, which, by the way, are sometimes more noticeable for size than for tasteful arrangement. We now refer solely to the perennial or Chinese Chrysanthemum (*C. Indicum*), and not to the annual kinds, which are not without their beauty, and are much earlier. There are three very distinct sets or classes of the Chinese Chrysanthemum, though European florists make several more. The Large-flowered, the Small-flowered or Pompon, and the Japanese, are each very distinct. They present a great variety of color, from pure white to dark purple and brownish red. Chrysanthemums may be treated as hardy border plants, but they are so late in flowering, that in most seasons a killing frost cuts them off before they have shown their full beauty. To thoroughly enjoy them, they should be potted for the window or the green-house, where their bloom may be greatly prolonged. To begin their cultivation, procure plants of a florist in the spring, and plant them out in good soil. If they make many stems, thin to four or six, and when they begin to show buds, pot the

very brittle and are liable to be broken by winds. The fine varieties are so numerous that we make no attempt to give a list. In commencing their culture, it will be safe to trust to the judgment of a reliable florist to make a selection of varieties.

MOUNTAIN ASH BERRIES are very showy, and would be of great use in holiday decoration, were they not ripe and away long before winter. If gathered when ripe, they shrivel and become discovered long before they are wanted for use. A correspondent of "The Garden" (Eng.) says, they may be preserved in perfection, if the clusters are covered with strong brine. Stick a pin here, and try it next autumn, not only on the berries of the Mountain Ash, but on a number of other brilliant and perishable fruits. Let us pickle the berries.

THE SNOWBALL ABUTILON.—Now and then there turns up a flowering plant that is, in its way, what the Concord is among grapes. If one has a plant, it is sure to give returns, and in abundance. The Snowball Abutilon (*Boule de Neige*), is one of the thoroughly reliable plants; whether it be six inches or six feet high, it will give flowers. It is easily propagated, and, so far as we have observed, has no whims or miffs. Though we have not tried it, we are quite sure, from its behavior in a very cool greenhouse, that it will prove useful in window-culture. Every florist can now supply the plant.

A Neat Book Covering.

For one's own use, or as a present for a grown-up brother, cousin, or friend, a neat book covering is made of good linen canvas. It is cut out as shown in fig. 1. Fourteen inches by ten will fit a good-sized book, and is not too large to be used on a small one. The edges of the cover are bound with narrow ribbon. A small pattern is worked in each corner, and an initial on the front, as in fig.

Fig. 1. THE PATTERN. Fig. 2. THE BOOK COVERED.

2. The cover is held in place by sewing the corners after folding to fit the book. After completion it can be put on, or changed to another book, by bending the covers back to slip it on and off.

A Hanging Medicine Cabinet.

BY D. Z. EVANS, JR.

In every country home where there is no drug store "just around the corner," more or less medicines are necessarily kept, and it is important to have them out of the reach of children. The writer has a cabinet like the illustration, hung on stout iron pegs, so high up that a child cannot get at it, and a lock and key is a still further security. It may be made of oak, walnut, or ash, one-half to

A PLACE FOR MEDICINES.

three-quarter-inch thick, with doors of three-quarter-inch. Ours is of ash, rubbed down, a good "filler" applied, and then varnished. It is quite ornamental as well as useful. The back is three feet long and eighteen inches wide, the square case occupying its middle being eighteen by eighteen by eighteen inches. A narrow shelf above, against the back, being little exposed, can be of pine if necessary. The shelves inside the cabinet may be arranged with spaces of eight, six and four inches for bottles and packages of different heights. For the side pieces make a pattern of pasteboard or thick paper, and cut in the form shown in

the engraving, or any other pattern desired. We always keep a good supply of simple remedies, all carefully labelled, and the dose plainly marked on the label pasted on each package and bottle; and to make "assurance doubly sure," a marked tag is tied to each package. This cabinet and its contents has saved us many a dollar for doctor's bills, and many a nocturnal excursion to call a physician.—[A less deep case and one of larger dimensions if needed, would project less into the room; and the bottles, etc., if arranged on narrower shelves inside, would be more conveniently accessible.—ED.]

How to Starch and Iron.

Every housekeeper knows the difficulty of starching and ironing shirt bosoms, collars and cuffs satisfactorily. When done at a laundry they have a glossy finish which both improves their appearance, and prevents their getting soiled readily. To give a fine gloss to linen, a good quality of starch must be used. It is best to get it by the box of six pounds or more, as it comes cheaper and is always at hand. The empty box is useful for other purposes. I have read of many additions to starch to give a gloss, such as white wax, spermaceti, and gum arabic, and have tried them all, but find them of no advantage if good starch is used. Gum arabic with cold starch sometimes makes the linen stiff. Mix the quantity of starch required with cold water to about the consistency of thin cream, then pour on boiling water and stir briskly. Make quite thick and keep over a good fire stirring all the time. Boil until clear, and some minutes longer to be sure that it is well cooked; (some think a little lard or butter added prevents the iron from sticking.) As soon as it has cooled enough not to burn the hands, take the linen, previously well washed and rinsed, and with the fingers rub the starch well into it and slap together. Continue this until the linen has taken all the starch it will hold. Then smooth with the fingers carefully, taking out all the wrinkles, with a clean damp cloth remove all the specks of starch from the smooth surface, and hang up to dry where no particles of dirt are floating. If hung out of doors when the wind blows it will take out a part of the starch. When dry, immerse the linen quickly in hot water, and roll up in a clean dry cloth. Usually it will be ready to iron in ten to fifteen minutes. Some dip the linen when dry in cold water containing a little starch dissolved, and then roll up. This requires time for the articles to become dry enough to iron well. When a collar, for instance, is ready to iron, lay a clean cloth on the cover of the ironing board, and place on it the collar with the outside down and apply an iron not too hot, lifting the collar up every time the iron passes over it to allow the steam to escape and to prevent its sticking to the cloth. While yet damp turn the collar outside up and iron once or twice, or until nearly dry (bearing in mind not to have the iron too hot); when removed to a bosom board made of hard-wood without covering, place on a bare table with polishing iron well heated, but not too hot, and go over the collar putting on all the pressure that you can, but not too slowly or it may scorch. Should the linen get too dry to receive a good polish, dampen evenly with a wet cloth. Much of the success in securing a good polish on linen, depends upon the pressure put upon it while damp, and having underneath it a hard board. A good polishing iron is essential. The one that gives me the most satisfaction costs 62½ cents. Doubtless there are others equally as good. M. M. S.

Good Apple Pudding.—A correspondent, with other recipes, sends us the following directions for a pudding which "eats well": Mix with each pint of sweet milk three beaten eggs, a tablespoonful of butter rubbed into a part of the flour, also a teaspoonful of baking powder and a saltspoonful of salt; then stir in enough more flour to make a stiff batter. Have the apples pared and sliced, as for pies, and placed in a deep dish;

pour the batter over the apples as thickly as it is desired, and bake as one would apple pies.

SAUCE for the above: One cup of butter, two cups of sugar mixed with the whites of two eggs beaten to a stiff froth. Cut the pudding in square pieces, serving with the crust downward on the dish and the sauce poured over the top.

A Match Strike.

One or more pieces of sand-paper should always be provided in a conveniently accessible place in every room, and thus save the temptation to mark walls or furniture. A unique and tasteful match-strike is shown in the engraving. It may be made on a base of thick card, or on one of the round pasteboard plaques about three inches in diameter, obtainable at any book store for a few cents. A picture of a dog's head or a group of Kate Green-

away children, or of a variety of other things, is painted on the plaque. A piece of sand-paper is cut the exact size of the plaque, and the two are glued together, a loop of narrow ribbon having first been placed between. Such match strikes, when hung on the gas fixture, the edge of the mantel, or beside the table, are useful and ornamental. M. E. R.

Home-made Boot Scrapers.

"T. F. D.," Galesburg, Ill., sends us a sketch of a simple and ingenious scraper for cleaning boots or shoes at the door. Neat housekeepers will appreciate every help of this kind. The materials are an old hoe-blade, eight screws, and two blocks of wood. The scraper is fastened firmly to the edge of the board walk, near a side door, and leaves no excuse for any one entering the house

with muddy boots. The engraving shows the shape and position of each part.—Another form of scraper is made of a broken iron rake. Holes to correspond with the teeth are started in the end of the door-step with a gimblet, and the teeth driven into these about an inch, leaving the smooth top of the head-piece of the rake for a scraper.

Chickens Fried with Rice.—Cut up two or three fine young chickens, and half fry them. Boil half a pint of rice in a quart of water, leaving the grains distinct, but not too dry, and stir into it a large tablespoonful of butter while still hot. Beat five eggs well into the rice with a little salt, pepper, and nutmeg if liked. Put the chickens into a deep dish and cover with the rice. Brown in an oven not too hot, and you will have a most excellent dish ready for the table,

Wooden Fruit Knives, etc.

Those who can afford it and do have the silver or plated fruit knives now common, need not read

A WOODEN KNIFE.

this. Any unplated steel knife is blackened by the acids of fruits, but housekeepers prefer a sharp steel knife for paring apples, pears, peaches, etc., and cleaning it before it rusts, to using the duller, thick-edged plated knives. And, by the way, the modern silver-plated knives are to be charged with no little dyspepsia and indigestion; they are too nice to be sharpened, and so the stomach is taxed with wearing down large pieces of tough meats which ought to be cut fine with a good old-fashioned sharp steel blade. Such meats none but the best molars can reduce to a proper condition for dissolving in the gastric juices, even if, in our fast eating age, the owner of such teeth stops to use them, which, unfortunately very few will ever do.

Men folks who pare fruits, and whose incisors, if they have them, do not easily break into the side of a large hard apple, resort to the pocket knife. But it goes against the grain to cut fruit with a blade which has just cleaned a hoof, skinned an animal, and often been used for other unclean operations. Here is a remedy. Any bit of hard wood whittled to a sharp edge, in half a minute, will pare and cut an apple, however hard, almost as well as a steel blade. It can be thrown away, or easily washed, or cleaned by taking off an extra shaving, and when dulled be sharpened in the same way. The sketch shows an extempore knife made of a stick from the kindling wood box, with three strokes of a pocket jack-knife, and in ten seconds. It has pared, cut and cored a number of quite hard apples very effectually. Boys, or men, can quickly "whittle" out a stock of them in quite artistic forms—say for evening use, when the fine toothsome apples and nuts go merrily round.

A Glove Case.

A convenient article, and one easily made, is shown open in the engraving. It is simply a piece of plush twelve inches square, on which are sewed two pockets of silk or plush of a contrasting shade. The outside of the case is plain, but on one pocket is embroidered a spray of flowers, and on the other the initial letter of the last name of the person for whom intended. The edge of the pockets and the case is finished with a silk cord. Ribbons are sewed to the front for tying it when closed. One ribbon

A CASE FOR GLOVES.

should be the same shade as the outside of the case, and the others the shade of the pockets.

Sally Lunn.—Break one or two eggs into a tea-cup of milk, sweet or sour, (sweet is best); add a table spoonful of lard, and two tea spoonfuls of sugar; beat all well together with one pint of flour. If the batter is not quite thin, add a gill of

cold water, which will keep the bread from being tough. After thorough stirring, add two table-spoonfuls of lively yeast, beat a little more, and set to rise from eleven to four o'clock. When ready for the second rising, stir in another pint of sifted flour, in which is mixed a teaspoonful of salt. When light enough, bake an hour. One pound cake-molds are generally used for baking the Sally Lunn. Turkish turbans molds, made either of tin or earthen-ware, are pretty.

Satin Panels.

Panels being so much used now, are made of almost every kind of material. They seem to fill spaces in some rooms where nothing else would

and suit her own taste. The pattern selected and ordered will be sent at once to any part of the country. The bust measure should always be sent. This is taken by passing a tape measure just under the arms and bringing it together a little tightly in front. Some of these patterns are pinned together so that a lady of ordinary skill can make her own and her children's dresses in the styles prevailing in the large cities, which are supposed to lead the fashions for the country. Ready-made dresses, and polonaises are now found in nearly all the large stores. These at first were not received with favor, as it was not supposed they would fit unless cut especially for the person who would wear them. But the art of cutting by measure is now so nearly perfected that ladies often find dresses needing no alteration and costing less than buying the material

TWO SATIN PANELS.—*Drawn and Engraved for the American Agriculturist.*

look as well. The pair here described are handsome and inexpensive. They are made of light blue satin and garnet plush, one having natural peacock feathers for decoration, and the other cat-tails and pressed leaves. The materials needed for a pair are one yard of light blue satin, three-quarters of a yard of garnet plush, some thin paste-board, dark paper muslin, and the feathers, cat-tails and leaves. For the foundation use a piece of pasteboard twenty-nine inches long and fifteen wide, and baste the satin on, leaving the space at the top and bottom to be covered with the plush which is blind-stitched on. Then fasten the feathers, cat-tails, etc., in place and finish the back by basting the muslin over it to protect it. E. S. W.

Hints for Dress.

Only a few years ago the question of how to have a dress made was very difficult to decide, and ladies often spent hours in consultation with their dressmaker. She would open her bag of newspaper patterns and show from which of these Mrs. A. or Miss C. had their last new dresses made, or what Cousin Julia, who "dresses so stylishly," wore when she called. The result would probably be a selection of something whose effect could only be guessed at. Now, scores of Fashion Journals are published with illustrations of every garment in a ladies' wardrobe, so distinct and of such variety that one can see just how it will look when finished

and having them made. They are of all grades, from shilling prints to the richest silks and velvets. They are described and illustrated, and the price given in the catalogues issued by these houses.

It has been said that a true lady is known by the fit of her gloves and boots. This we do not accept as the rule, for many a real lady would take nothing from the scanty purse for choice fitting gloves and would put on her weary feet only such shoes as are large and easy. Still a refined taste would not choose such, and the whole selection of a lady's underwear should be nice in quality and fitting as neatly as the outside dress. Cheap hats, loaded with feathers and flowers, silk dresses, cheap and flimsy, made heavy with trimmings; ear-rings, chains, locketts, rings, with perhaps no gloves—for the street—awaken suspicions that the money is all on the outside. There should be consistency in dress throughout, and whatever one is able to spend for dress should be so divided that the underclothing will be as good as that exposed to view. Formerly ladies made their own undergarments, stitch by stitch; now, the sewing-machine relieves many aching backs and heads. When undergarments can be bought ready made, at little more than the cost of the material at retail, and in any style and at any price, according to quality and trimming, it seems a waste of time to make such articles at home. Fine French embroidered garments are very handsome and cheap; night-gowns and chemises each from two dollars up, and drawers from one dollar upwards. ETHEL STONE.

A Western Boy's Adventure.

BY AGNES CARR.

"Now Jack, don't forget the meat or the meal, or the liniment," said grandma Spencer, "and try and get some newspapers from the officers at the fort;" and the old lady glanced gloomily over the flat prairie land, now covered with an unbroken crust of snow. She had come from New England two years before, to the cattle ranch, to keep house for her son and grandson, and scarcely saw a

lend a hand," and he looked up to see old Ben the "trapper," struggling with some large contrivance.

"Why! Ben, is that you! what are you doing?"

"Settin' a bar-trap, hut the pesky thing is mighty contrary."—"I'll help you, and gladly," said Jack, "but I didn't know there were any bears round here."—"I've seen the tracks of a big one, and if I kin I want to take him alive."—It took them half an hour to set the immense trap, which was a rude contrivance like a large box, with thick iron wire sides, balanced on a pole that would drop at a gentle touch, and baited with a huge lump of deer meat. The sun was high up before Jack started on.—"Hurry up, my lad," was the old man's parting injunction, "for we'll have more snow afore many hours."—Moose Lake shone like a burnished mirror in the sunlight, and Jack buckled on his skates and glided gaily over the polished surface. On reaching and entering the one Store the little place afforded, he found it filled with a motly crowd of ranch-men from the prairie, Indians from the Reservation, soldiers from the fort, women, children and dogs, jostling each other in mad confusion, for a wagon train had just arrived and all were eager to watch the unpacking, and get a first choice from the new supplies. It was very interesting to Jack, and he lingered longer than he should before making his purchases: storm clouds were flitting across the sky before his basket was packed, the liniment for grandma's rheumatism

and as the boy paused in the middle to rest on a sunken stump that protruded through the ice, it seemed very solitary, not a moving thing visible except a small object which appeared to be coming toward him from the shore. "I wonder if it is a bird," he thought; "If I had brought my gun, I would try my luck at it." But a few minutes later he was glad it was safe at home, as the mysterious figure gradually resolved into a scarlet dress, and mass of golden curls. He started to his feet, exclaiming, "Why! Daisy Carlton, how came you way out here!"

"Ogla brought me," solihed the little six-year-old, "hut he went off with some of his Indian friends, telling me to wait until he came back. He has been gone a long while, and oh! Jack, I am so glad you have come." It was too evident that the "Half Breed" who had the care of the captain's daughter, had become absorbed with his old cronies, returning to the Reservation, forgetting all about his young charge.

"Well, don't cry," said Jack, "come with me, and we may meet Ogla on the other side of the lake." But the shore reached, nobody was to be seen, and now, too, the twilight deepened, and large feathery flakes began to fall.—"There is nothing to do but take you home with me," said Jack, "and send word to the fort as soon as possible, for they will be alarmed about you." Daisy assented, and trotted contentedly along by his side.

SAVED IN A BEAR TRAP.

Drawn and Engraved for the American Agriculturist.

face, outside her own family, once a month.—"All right! Granny! I will try and remember everything," replied Jack—a bright, cheery lad of fourteen, as straight and supple as a young Indian.

"Won't you take your gun?" she asked.—"No, it would be in the way, with this great basket. I shall be home long before dark, and there's no danger in the woods by daylight."—"Then hurry, for the days are short, and when the sun sets the wolves and jackals and screech owls make noise enough to scare the hair off your head," and grandma shook her grey locks dolefully.—"They are too great cowards to appear in the day time," called back Jack, "and I shall fairly spin across the lake on my new skates." Then with a cheerful nod and wave of his hand, the boy bounded forward over the icy crust. It was seven miles from the Spencer ranch to Waltham, the nearest trading or military Post, three miles of which lay through a dense forest, and two across Moose Lake, now frozen, where Jack anticipated a fine glide on his new skates, a New Year's gift from his father. He was accustomed to make this trip once a fortnight, and now trudged briskly through the snow, swinging his basket, and awakening the echoes with his merry whistle, when a rough voice hailed him with "Halloo Jack, you are just in time to

tucked away in his pocket, and a new muffler for himself selected and tied round his neck. "I've no time to call at the fort," thought Jack, "but I must leave father's message for Captain Carlton, and grandma will be so disappointed if I don't bring the newspapers." So he set off on a sharp run for the fortification. He was a great favorite with the captain and his wife, and Mrs. Carleton welcomed him warmly, but seeing his anxiety to start homeward, did not press him to stay; she promised to deliver the message to the captain, who was absent, and quickly tied up some newspapers, and added some oranges and white grapes, part of a Christmas box from home.—"I wish you could stay all night, Jack," she said, "but I know your father would be worried. Remember me to Mrs. Spencer, and if you see Ogla and Daisy on the road, please send them home. Ogla took Daisy up to the lake to slide on the ice, and neither have any idea of time."—"I will, if I meet them; and thank you very much Mrs. Carlton."

Having executed all his commissions, Jack turned his face fairly toward home. The basket, heavier than in the morning, hindered his progress, while the wind began to whistle, and the gray clouds to scud across the sky with fearful rapidity. The lake now looked dark and sullen,

As they entered the woods the gloom increased, and before long, Daisy said she could not walk any further, "her feet were so heavy." So Jack took her on his back, and with this added burden, trudged bravely forward, though his anxiety increased with the darkness, and he kept his eyes right and left, for he knew only too well that it was very late to be alone and unarmed in the lonely forest.—"Sing, Jack!" said the child, who was now quite happy, riding "pick-a-back," as she called it. He tried to comply, and started a lively school song, but stopped suddenly in the second verse, as his quick eyesight caught glimpses of two shadowy forms moving through the underbrush, and four balls of fire seemed peering out of the depths of the wood. "Wolves!" he almost gasped.—"Go on!" said the little lady, "why do you stop Jack?"—"Hush Daisy, I can't sing, for I must run;" and throwing away his skates to lighten his burden a trifle, he started at a quicker

pace. But he could not keep it up, and as the shadows deepened, the wolves appeared bolder, their sharp bark resounding through the forest, and Daisy cried, "O! Jack, two great ugly dogs are following us."—"What shall I do," thought poor Jack, "I could easily climb a tree, but I can't leave little Daisy. Why! she is the very apple of the captain's eye. No, I'll fight the wolves as long as I can." Drawing from his basket the beefsteak got for breakfast, Jack threw it far behind, which satisfied the wolves temporarily, and sped on with his burden. But the pat, pat, of the horrible footsteps soon sounded behind them again, as the animals, with their appetites only whetted by the morsel, came on all the more furious. The Sunday dinner followed the breakfast, but the basket with all its contents proved only a "sop to Cerberus," while Daisy, now too frightened to speak or cry, clasped the boy tighter and tighter around the neck.

"I can't hold out much longer," thought Jack, and he was just seizing a large branch, determined to sell his life as dearly as possible, when right before him appeared a huge black object, Ben's bear trap, and just as one wolf made a spring at wec Daisy, he turned suddenly, beat the animal back with the branch, and with a rush darted right into the dark box. It fell with a crash, and the infuriated wolves snapped and snarled with rage and disappointment outside. Panting, and almost fainting, Jack sank on the cold ground, while Daisy, still shuddering at the ugly, hungry faces pressed against the wire sides of their cage, asked piteously, "oh! Jack, can't they reach us?"—"No Daisy, we are safe from the wolves," said Jack, though he added under his breath, "but unless help comes soon we shall freeze to death:" for it had turned bitter cold. If Jack lives to be an old man, he will never forget that night. How the wind whistled through the trees, and the snow fell heavily, banking up the trap. He wrapped Daisy in his jacket, sang her to sleep, and trying to keep himself warm with a blanket of newspapers, he moved about in the narrow space, until the drowsy numbness that precedes freezing forced him to lie down, half conscious he might never awake again.

It was nearly midnight, and Ben the trapper sat by his cabin fire, enjoying a pipe before retiring, and his old yellow dog "Rags," curled up in a fox skin by his side. "Well! Rags, old boy, I think it is time we were turnin' in for the night," he had just remarked, when a low tap made the dog prick up his ears. "Who can that be!" cried the trapper, crossing to open the door, and starting back as he confronted a dark Indian face, that looked ashy in the fire light.—"Ogla!" he exclaimed, "what is it, anything wrong at the fort?"—"Miss Daisy! the captain's little pale-face Daisy! I can't find her!" gasped the man.—"What! Daisy Carlton lost, this winter night?" asked Ben.—"Yes, I tell her wait by lake. I go smoke, drink with Reservation Indians, I come back, no Miss Daisy! Oh! Ogla! 'fraid to go home and meet captain's eye."—"No wonder," growled Ben, "and there's no time to be lost! These Injuns are never to be trusted!" Hastily drawing on a great coat, taking his rifle, and lighting a lantern, he was ready to set forth, accompanied by Rags, who ran ahead, leaping gaily through the drifts. Almost in silence the two men waded through the deep snow towards Moose Lake, occasionally shouting, in hopes of a response. "I fear she is buried under a drift," said Ben at last: but just then a loud, joyful barking from Rags attracted their attention. "I declare, if that 'ere dog ain't a diggin' at the bar-trap, and I believe there's a bar in it," and he hurried in that direction. Sure enough the box had fallen, and Rags was scratching round it with might and main. "I must have a peep, if I'm shot for it!" said the old man in great excitement, lifting his lantern and peering through the wires; but at the first look he almost fell back in the snow, as he cried, "If there ain't them blessed babes in the woods, safe and sound in old Ben's bar-trap!"—A loud whoop of joy from Ogla rent the air, and then both lifted the heavy box, and gently raised the two children from their cold resting place. Daisy awoke bright

and well, and so surprised to find herself out in the woods in Ogla's arms; but old Ben shook his head sorrowfully, as he laid the still unconscious Jack by his cabin fire, and tried to rub a little warmth into his stiffened limbs but it was long before the boy opened his eyes, and came slowly back to life. "Another half hour and he would 'a bin froze deader than a door-nail," said Ben.

Meanwhile Waltham was in a high state of excitement. The news that the captain's daughter was lost soon spread, and soldiers were sent scouring the country for miles around. Toward morning they were met by Mr. Spencer and his men, who informed them that Jack was also missing. The wolf tracks and the torn basket made them fear the worst, as they returned finally to the fort, and it was a sad company that the sun rose upon after the storm. The joy, then, can be better imagined than described when Ogla came straggling into camp, bearing his little golden-haired mistress in his arms, and it was a triumphant procession that marched out to Ben's log cabin, and held a perfect ovation over the young hero,

Poison Ivy, all have an abundance of such roots along their stems. The stalks of Indian Corn send out roots from several of their lower joints, as you will find by examining them. These reach out into the soil and help the stalk to resist heavy winds. They are called "brace" or "stay" roots. Except in size, they are much like the roots of the celebrated Mangrove, shown in the engraving below.

Games for Winter Evenings.

"Oranges or Lemons," or "London Bells," is a game that will often cause considerable sport for a party of young people. Two of the tallest players are chosen, who join hands and hold them up to form an arch. The rest of the company take hold of each other's dresses or coats, and march one after the other beneath the arch, singing in chorus: "Oranges and lemons, say the bells of St. Clement's.—You owe me five farthings; say the bells of St. Martin's.—When will you pay me? say the bells of Old Bailey.—When I grow rich; say

A MANGROVE GROVE.—Engraved for the American Agriculturist.

who received them in state, reclining on the great bear skin, the trapper's greatest pride and delight, with grandma by his side, sobbing and laughing over her precious boy, and who would hardly resign her place for a moment to Captain Carlton and his wife when they came with overflowing gratitude to express in broken words their thanks to the noble lad, whom they felt they could never repay.

The big bear still wanders at large, but Ben seems quite satisfied, and is never weary of telling of Jack's thrilling adventure with the wolves, and how "two pretty cubs were caught in a bar-trap."

The Mangrove Tree.

The Mangrove is a small tree found on our far southern shores, which throws out roots from the main stem, and forms a dense hedge along the shore. The trees are found most flourishing between the high and low water mark, and their trunks are covered with water part of the time.

Once when at Guaymas, on the Gulf of California, we went with an excursion to a small island near the port, and a part of our entertainment was the oysters growing in great abundance attached to the Mangrove trees which lined the shore. Roots like those of the Banyan and Mangrove are called "aerial" or air roots. Those that reach the ground help nourish the tree. In some plants they aid the stem in clinging to the bark of trees, walls, etc. The European Ivy, the Trumpet Creeper, and the

the bells of Shoreditch.—When will that be? say the bells of Stepney.—I do not know, says the great bell of Bow.—Here comes a candle to light you to bed.—And here comes a chopper, to chop off the last, last, last man's head."

The last one in the line being cut off by the descent of the arms forming the arch, is asked whether oranges or lemons are preferred, and according to the answer is sent to the right or left corner of the room. This is repeated until all heads are off, when the oranges and lemons have a tug of war. The contestants clasp each other around the waist, the foremost players of each party grasp hands, and all pull with might and main. That party wins which brings the other over to its side of the room. The war tug may well be confined to the boys of the party, the girls looking on and cheering their respective sides. This play is also best adapted to uncarpeted floors.

MY LADY'S TOILET

Somewhat resembles the old game of "Stage Coach." Each player takes the name of some article of the toilet—as a comb, brush, ear-ring, handkerchief, hair-pin, etc.—and a chosen lady's maid stands in the center, and calls for whatever her lady is supposed to require. The person representing the desired article must jump up immediately and go through the motions of using it, as brushing hair, or tying a bow; or else pay a forfeit for negligence. Occasionally the maid declares, "My lady wants her whole toilet," when all the

company must rise, and change seats. In the confusion, the maid rushes for a chair, and the player left without a place then becomes lady's maid.

PIGEONS FLY,

Is a quieter game, but quite as amusing. The company sit round a table, each placing his two fore-fingers upon it. The leader says "Pigeons fly!" and quickly waves his hands in the air to imitate flying. All the players do the same, excepting when he calls out a name of some animal that can not fly. Thus, the leader cries rapidly, "Robins fly! Bees fly! Chickens fly! Cats fly!" In the excitement of the game many lift their hands from the table, without considering that cats do not fly, and these players are then obliged to pay forfeits.

Do Deer Shed their Horns Annually?

inquires "D. B.," of Aroostook Co., Me. All our deer, including the elk and moose, do so. After the horns have dropped, a skin for new horns is formed, and the animal is then said to be "in the velvet." This velvety covering in time disappears, leaving the antlers hard and horny. The weight of horn shed by our elk and moose is large, but

THE ANTLERS OF THE IRISH ELK.

small when compared with the antlers of the extinct Irish elk, the remains of which are found in great abundance in the bogs of Ireland, and its horns are to be seen in our museums. They rose to a height of at least fourteen feet, and had a spread of twelve feet. The skull with the horns as found, shown above, weighs over ninety pounds, and it is estimated that, when alive, the animal had to support at least a hundred pounds in his enormous antlers.

How Our Eyes Sometimes Deceive Us.

There are some minute fossil objects called "Diatoms," which, when seen under the microscope, show beautiful markings upon their surfaces. An eminent French naturalist, while examining one of these which had been described as

CIRCLES WHICH DO NOT SEEM ROUND.

six-sided, found to his surprise that under a very powerful glass the figures were true circles instead of hexagons. This led him to try small circles of black on a white ground, and circles of white on a black ground. The engraving shows the white circles, and if you look at it from a little distance, it is difficult to believe that the white spaces are not six-sided instead of circular. The effect is more striking if one eye only is used. This is one of many cases in which the eye is sometimes deceived by strong contrasts of white and black.

GOING!

GOING!

GONE!

Hunger, the Best Cook.

ADOPTED FROM THE FRENCH OF JEAN GRANGE.

Mr. Rosiers, a French millionaire, was fond of eating; he knew what good food was, and provided it without stint; but, alas! the appetite was wanting. In vain he sat down at stated hours to the choicest dishes and costliest wines. Everything he tried was tasteless, and he rose to curse his own palate, his butcher, and his cook. The cook he thought most to blame, and no better than a thief, for was he not drawing high wages, and spoiling everything he touched? Old Matthew, the game-keeper, after long listening to his master's

moans and lamentations, took courage to say that he knew a man famous for miles around for his "fine cooking."—"Where is he?" eagerly asked Mr. Rosiers.—"He keeps an inn at Vanzelles, a village fifteen miles away, but it is a rough sort of place, and his patrons are chiefly wagoners or sportsmen—you would hardly like to go there, Sir."—"I would go anywhere to find a dinner I could relish," the rich man quickly replied, "and I shall not fail to visit your friend to-morrow."—"But, sir," said Matthew hesitatingly, "old Lelong, the host of the 'Faithful Pigeon,' as he calls his inn, is not accustomed to having a coach and pair stop at his humble door, and I fear if he sees your equipage, he will lose his wits, and be in danger of spoiling his dishes. But if you go there on foot with your gun as an ordinary sportsman, seat yourself at the general table, and eat out of tin and common earthenware, you will have a most delicious meal."—"Very well, Matthew, I can easily put up with the earthenware."

The next morning, after nibbling a biscuit and sipping a little wine, Mr. Rosiers took his gun, and set out for Vanzelles. He was past fifty, short and stout, and was quite unaccustomed to walk fifteen miles for his dinner. The day was warm, and when he reached the "Faithful Pigeon," he was out of breath and ravenously hungry. Dinner was just being served, and the millionaire quietly took the first empty seat among the wagoners.... Never before had he tasted such tempting dishes, deliciously cooked, and served in delf and earthenware! Certainly, Lelong was the best cook in the world! After a deal of persuasion, the host of the village-inn was induced to leave his establishment, and accept enormous wages as head cook in Mr. Rosier's city mansion. But, alas! his roasts and fricassees were not the same as when prepared in his own little kitchen; he seemed to have lost his art, for the rich man again lost his appetite. In vain he scolded, in vain the new cook tried his best to tempt the master's palate, and appease his anger. "I shall die of starvation!" cried Mr. Rosiers, rising from a sumptuous, but untouched meal. "Matthew, can you explain the meaning of this?"

"Do not be angry with me, sir," replied the game-keeper, "but remember, that it was only when you had walked fifteen miles for your dinner that you were able to enjoy it. If your food seems tasteless now, Master, it is not Lelong's fault.

About Scorpions.

—o—

A young reader asks what kind of creatures scorpions are, and if their sting is deadly. Scorpions are closely related to spiders. Their bodies have six broad joints, and six others very narrow which form a sort of tail. Two of their mouth parts are formed into pincers, like the large claws

of the lobster. At the end of the tail is a sting, having two very small openings below the point, that connect with a little bag from which a poisonous liquid is thrown into the wound made by its sting. The scorpions vary in size from an inch in length, to the enormous kind found in Ceylon, six inches long. They are found in all warm countries; a small one is a native of some of our Southern States, and in Western Texas they are quite abundant. They are usually of a greenish-yellow color, and in Africa there is a black one. The violence of their poison varies greatly in the different kinds, but ordinarily it is not more serious than the sting of a wasp. I have known many persons stung by them. In travelling in Western Texas, and in what is now Arizona, our teamsters did not take the trouble to put up their tents, but spread blankets on the ground, and their only preparation for bed was to take off their hoots. I have frequently seen a hoot fly across the camp, accompanied by a loud exclamation. The teamster in putting on his hoots in the morning, was made painfully aware that a scorpion had taken shelter in one of them during the night, by a sting in the intruding foot. This happened a number of times, and I never knew a man to be laid up from the effects. Intelligent Mexicans informed me that there is a scorpion in the southern portion of their country, whose sting is always fatal to children. THE DOCTOR.

Head, Body, and Legs.

A party of young people may amuse themselves a long time thus: Cut some pieces of paper of any size desired, but three times as long as broad. Each one with a pencil draws upon the upper part of a piece of the paper the head of a quadruped, or bird, or a human one, and folding the top down to just cover the drawing, passes it to another, asking for a "body." When this is drawn and covered

by another folding down, the papers pass on to others to add the legs. After all are finished one is chosen to unfold and exhibit the drawings, and a variety of odd and ridiculous figures will appear, affording great amusement and fun. The four small cuts in the upper portion of the engraving show the manner of folding the paper as the different parts are drawn, and below are given specimens of incongruous figures that may thus be produced. When drawing the head, continue the neck a little below the fold, in order that the one who draws the body may know where to attach it. Do the same with the lower edge of the body.

VICTORIES **UNEQUALLED**

The only machine that received an award on both Horse-power and Thresher and Cleaner, at the Centennial Exhibition; was awarded the two last Gold Medals given by the New York State Agricultural Society on Horse-powers and Threshers; and is the only Thresher selected from the vast number built in the United States, for illustration and description in "Appleton's Encyclopedia of Applied Mechanics," recently published, thus adopting it as the standard machine of this country. Catalogue sent free. Address **VINARD HARDER, Cobleskill, Schoharie Co., N. Y.**

The new American Minister to Persia, Mr. S. G. W. Benjamin, is writing articles descriptive of that country for the *Youth's Companion*. That paper is represented at the seat of war at Tonquin by the famous correspondent of the New York *Herald*, Col. W. H. Gilder.

(Continued from last month.)

How Watch Cases are Made.

Imitation always follows a successful article, and imitation is one of the best proofs of real honest merit; and thus it is that the *James Boss' Gold Watch Case* has its imitators. Buyers can always tell the genuine by the trade-mark of a crown, from which is suspended a pair of scales. Be sure BOTH crown and scales are stamped in the cap of the watch case. Jewelers are very cautious about endorsing an article unless they not only know that it is good, but that the character of the manufacturers is such that the quality of the goods will be kept fully up to standard.

WILLIAMSPORT, Pa., Feb. 13, 1883.
The *James Boss' Gold Watch Cases* go like hot cakes. Each one I sell sells another. Don't need to recommend them; they sell themselves. One of my customers has had a *James Boss' Gold Watch Case* in use for 20 years, and it is as good as ever. With this case I do not hesitate to give my own guarantee, especially with the new and improved cases, which seem to be everlasting. **JESSE T. LITTLE, Jeweler.**

NEW BRUNSWICK, N.J., Jan. 8, 1883.
This gold case, No. 6686, known as the *James Boss' Gold Watch Case*, came into my possession about 1853, has been in use since that time, and is still in good condition. The movement is the one which was in the case when I bought it, and its condition shows that the case has really out-worn the movement, which is played out.

MARTIN A. HOWELL,
Of Board of Directors N. J. R. R. & Trans. Co.
Send 3 cent stamp to Keystone Watch Case Factories, Philadelphia, Pa., for handsome Illustrated Pamphlet showing how *James Boss' and Keystone Watch Cases* are made.

"ACME" PULVERIZING HARROW

AGENTS
WANTED.

It is the best selling
tool on earth.

CLOD CRUSHER
AND LEVELER.

The "ACME" subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **double gangs of CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling off the ground and thoroughly pulverizing the soil** are performed at the same time. The entire absence of **Spikes or Spring Teeth** avoids pulling up rubbish. It is especially adapted to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface of the ground**.

We make a Variety of Sizes working from 4 to 15 Feet Wide.

DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

SEND FOR PAMPHLET CONTAINING THOUSANDS OF TESTIMONIALS FROM 46 DIFFERENT STATES AND TERRITORIES.

BRANCH OFFICE: **HARRISBURG, PA NASH & BROTHER,** Manufactory and Principal Office: **MILLINGTON, N. J.**

N. B. PAMPHLET "TILLAGE IS MANURE" SENT FREE TO PARTIES WHO NAME THIS PAPER.

THE SUGAR MAKER'S FRIEND.

Over 7,000,000 Sold, to replace various other kinds.

Users acknowledge that the **EUREKAS** run enough sap every year over any others to more than pay their price.

If **SUGAR MAKERS** fail to get a supply of these Spouts of a hard-simpl River, charges prepaid, not less than 100, on receipt of prices here given. Samples of each sent post-paid on receipt of five U. S. 2-cent stamps. Address orders at once to **C. C. POST, Patentee, Burlington, Vt.**

No. 2, \$4.25 per hundred.

Spout No. 1, \$4.50 per hundred. Actual size, with heavy wire Hanger, that does not break like Hangers cast on a Spout.

FERTILIZERS.

\$75 Premium.

\$50 to the farmer raising the largest crop of potatoes this year upon one-half acre manured with **SARDY'S FERTILIZERS**. \$25 for the second largest.

416 1-2 bushels good potatoes raised on one-half acre in 1883 by Alfred Rose, Penn Yan, N. Y., with **SARDY'S PHOSPHO-PERUVIAN GUANO**, adapted to all crops.

Standard Guaranteed. Prices Reasonable.

Send for Pamphlet,

J. B. SARDY & SON, 141 Water St., N. Y.

BOWKER'S

Hill and Drill Phosphate with Potash.

A general Fertilizer for all crops, and low in price. Send for Pamphlet.

BOWKER FERTILIZER CO., Boston and New York.

Sample Copies free! Send for one. Mention this paper. **FARMERS' REVIEW CO.,** Chicago, Ill.

ARM & HAMMER BRAND

TO FARMERS.—It is important that the Soda or Saleratus they use should be white and pure, in common with all similar substances used for food.

In making bread with yeast, it is well to use about half a teaspoonful of the

"Arm and Hammer" Brand Soda or Saleratus at the same time, and thus make the bread rise better and prevent it becoming sour by correcting the natural acidity of the yeast.

DAIRYMEN and FARMERS should use only the **"Arm and Hammer"** brand for cleaning and keeping milk pans sweet and clean.

To insure obtaining only the **"Arm and Hammer"** brand Soda or Saleratus, buy it in "POUND or HALF POUND PACKAGES," which bear our name and trademark as inferior goods are sometimes substituted for the **"Arm and Hammer"** brand when bought in bulk.

"THE BEST IS THE CHEAPEST." **SAW MILLS ENGINES** Threshers, Horse POWERS. (For all sections and purposes. Write for FREE Pamphlet and Prices to **THE AULTMAN & TAYLOR CO.,** Mansfield, Ohio.)

Small Cows.—Mr. H. E. Prindle, Cleveland, Ohio, and others.—We do not know where the "Diminutive Cows" can be obtained.

The New York Fanciers' Club.—This association of poultry breeders will hold its second annual exhibition in New York City during the last week of January and the first week of February.

Old Ensilage.—Dr. J. M. Bailey informs us that he is feeding all his live stock at "Winning Farm," Mass., on ensilage made in 1882, and has enough of this crop to last another year. Dr. Bailey has no trouble in keeping ensilage for any length of time.

To Get Rid of a Big Stone.—E. McCormick, Jr., Munroe Co., Mich., asks how to get rid of a stone that cannot be readily drawn out by his horses and is in the way of the plow. One method is to dig a hole by its side, and drop it down deep enough to be below the reach of the plow. If stones are needed for use this might be broken up by a blast.

Coal Ashes and Muck for Evergreens.—H. Upsall, Iroquois Co., Ill., asks if coal ashes would answer to mix with swamp muck to make a fertilizer to apply to evergreens. We should prefer to use the muck alone. Coal ashes contain such a slight amount of plant food that they are hardly worth handling, save for their ameliorating effect on heavy soils. The best use for coal-ashes is to make paths or roads with them.

Hungarian Grass and Millet.—J. M. Marshall, Somerset Co., Pa.—Hungarian grass and Italian, German, and Golden millets are much alike, and if grown for hay or green fodder, there is little difference in their value. The millets have much larger heads of larger grain. Neither would be a suitable crop with which to sow clover and timothy, as aside from growing too closely, the Hungarian-grass, etc., should not be sown until the soil is well warmed, while clover and timothy need the cool weather of early spring.

Value of Land Plaster.—Mr. G. W. Quigley, Rock Hill, Mo.—Plaster may be applied to clover at any time during the early growth of the crop. Clover, and other leguminous plants, like beans, peas, etc., respond much more quickly to plaster, than does timothy and other true grasses. Land Plaster (gypsum), is composed of lime and sulphuric acid, chemically united, and furnishes food both directly and indirectly to plants. It will not make a barren land fertile. There are the so-called "Potato Manures," but potatoes are not so different from other field or garden plants as to need a special manure. The amount and quality of any manure should be determined more by the conditions of the soil, than that of the crop to be grown.

Sorghum a Success.—The thirtieth Bulletin of the New Jersey Agricultural Experiment Station gives the results of experiments with sorghum for the season of 1883. The plots selected were of uniform quality, and had been in grass for three years. The ground was prepared as for corn, and the fertilizers were spread broadcast and harrowed in. Phosphoric acid was supplied in bone black and superphosphate, nitrogen in nitrate of soda, and potash as muriate and sulphate. A study of the table shows that with one exception (land plaster) potash was applied in all cases, when the yield of sugar was over four thousand pounds per acre. Potash developed more sugar than any other single fertilizer, and when combined with nitrogen, gave the highest yield. Potash sulphate surpassed the muriate. The superior value of the sulphate for sugar beets and potatoes is an old fact. At the Rio Grande (N. J.) plantation the plots having phosphoric acid, matured their cane earliest, which corresponds with the results in sugar beet culture. It was found that the quantity of cane is no index of the yield of sugar. One plot gave three tons of cane per acre more than another, but yielded between three and four hundred pounds less sugar. The yield of pure, dry sorghum seed was found to vary from twenty-five to thirty-nine bushels per acre. This is regarded as about equal in feeding value to corn.

The German American Agriculturist.

The German *American Agriculturist* is the only purely Agricultural paper published in the United States. It is prepared for German readers and, with the immense resources of the English establishment to draw from, we are enabled to prepare a paper which every German reader should have, at the price of \$1.50 per year. We have printed a very large special edition for specimen copies. If our American readers will send the names of any of their German friends on a Postal Card, we shall be glad to forward such friends a copy of the German edition. If any of our readers have German gardeners or laborers, they cannot do a better thing than to present them with the *Amerikanischer Agriculturist* for 1884 as a Holiday present. The paper will please them, and give them ideas and suggestions which will prove of money value to their employers.

"Make A Note On't."

Capt. Cuttle's frequent injunction, "when found, make a note on't," should be heeded by all cultivators of the soil. Each farm and garden has its local peculiarities of soil, situation and season, and a record or times of sowing and planting, as well as of ripening and harvesting, will often be of great value as a guide for future operations. This farmer's or gardener's "log-book," or diary, may well be kept by the oldest boy, who would thus become interested in the daily work, and acquire the habit of doing something at a particular time. Books with a heading for each day, or diaries, can be bought at a small outlay, or a common blank book will answer. It may interest the boys to know that one of the long-time editors of this journal, always attributes his coming to such a position, to his early practice when a boy on the farm, of keeping a record of eighty cows, the names of the animals, all about them, a plan of the fields, and notes on whatever was done in them, etc., etc. This custom insensibly taught him to put his thoughts on paper, much better than writing "composition" in school. And his record books were only foolscap paper, folded and stitched. The operations of each day should be noted; and to make the record more useful, the progress of the crops may well be recorded. For example, if potatoes are planted on such a day, add to the entry of this, the time when they break ground, how or when hoed or cultivated, manure, seed, when dug, etc. Such a book will be all the more valuable if the weather is recorded, and the readings of the thermometer at sunrise, noon, and sunset. In noting the sowing of seed etc., state the variety as well as the quantity sown to the acre. Such a record carefully kept, will be frequently referred to as a guide in the future. It may be made of still greater value, if the coming and going of help are put down, as well as the various purchases and sales of animals, implements, and their prices.

Forcing Rhubarb, Asparagus, Etc.

The forcing of the production of vegetables far in advance of the usual season, by aid of artificial heat, occupies a large share of the time of the English gardener. It was formerly much more prevalent in this country than since the rapid carriage by railway and steam brings large supplies raised at the South to the Northern markets, and furnishes many vegetables much cheaper than they can be produced here by forcing. Lettuce, which does not bear long transportation, is about the only vegetable that is now forced on a large scale. Boston is the headquarters for this industry, and there are many acres of glass devoted to it in the neighborhood of that city, the growers supplying the markets in nearly all the large Eastern cities.

Asparagus was never forced to a large extent for market with us, as the plants must be four or five years old before they are large enough for this.

The beds in the Southern States are now productive, and the supply is annually increasing. It comes in small quantities in January and is abundant in February. Rhubarb is occasionally forced as an incidental crop by florists, who thus utilize the space under the benches of their green-houses. Roots from an old bed, or plants raised for the purpose, are stacked closely under the benches, and fine soil sifted over to fill up all the spaces between the roots. With the temperature at from sixty to seventy-five degrees, stalks are soon produced, and the florist often thus derives a handsome return from a small outlay. A supply for family use can be readily forced by placing a few roots in a barrel or cask with earth to fill the spaces. The plants do not need light; indeed the stalks are all the more tender when produced in the dark, hence the barrel should be covered, taking care to supply water as needed. It may be set near the cellar furnace, or in a warm place in a spacious kitchen. If more convenient, it may be set under a shed with fermenting manure piled around it. Of course preparation for forcing in this manner should be made before the ground closes. Still, advantage may be taken of the usual "January thaw" to lift a few roots for the purpose, and still give a supply of stalks much earlier than they can be had from the open ground. The roots after forcing are worth but little, and it is better to keep up a supply by making new plantings than to set out those which have been exhausted by the operation.

Suggestions for Festive Decorations.

In putting up evergreen decorations, short inscriptions or mottoes and fanciful designs add wonderfully to the general effect for both homes and churches. Cedar and hemlock, although very rich and beautiful, are, as a rule, too heavy by themselves, and give a sombre appearance, unless lightened by bright autumn leaves, light graceful ferns, or lettering in gay colors. But many cannot handle the brush skilfully enough to illuminate nicely, and as such inscription, and devices are only viewed from a distance, it is well to know how to produce a good effect by very simple and inexpensive means.

A square of colored flannel, red, blue, black, or green, forms a very pretty background, on which may be placed stars, crosses, shields, monograms, or any other appropriate device. These cut out of white paper and bordered with evergreens or ferns, with a few holly sprays dotted with scarlet berries in the center, make a charming ornament for bare walls. White sheet-wadding, with its glazed surface, makes excellent letters, that look at a short distance like solid marble when neatly cut out and arranged on a dark background—black velvet throws them out particularly well. Pretty designs may be made by cutting the desired form out of heavy white card-board, giving it a thick coat of warm paste, and then throwing rice upon it.

The little yellowish white immortelles, or everlasting, that grow so plentifully in mountainous regions, can always be nicely worked in, and those who have had the forethought to gather a supply of these tiny flowers, will find nothing prettier of which to form these mottoes. They have the advantage that they will last from year to year. Cover the surface of the pasteboard with hot glue and stick the flowers on singly in rows, forming the desired sentence, previously outlined with pencil. If the finished letters warp at all, place them under a heavy book to dry. Florists dye these flowers in all the hues of the rainbow; but they are much to be preferred in their natural state.

If a particularly brilliant effect is desired, gold paper, and frosting—a substance obtainable at paint stores—are used, but perhaps the most beautiful letters of all, are rustic ones, made of lichens, moss, fungi, or pressed climbing fern. It is very effective to cover a monogram, or star sawed out of wood, with these, and bore holes in which to insert branches of holly well decked with berries. Hang it over the folding-door of a parlor, and train long sprays of climbing fern from it, on fine wires in all directions, so as to form a triumphal arch.

New Farm Implements and Appliances.

Bunching Asparagus.—A Simple Device.

"R. W. B." Chester, Pa., sends us a sketch and description of a very simple device, which any one can construct in an hour, that will enable him to make up neat bunches of asparagus with great rapidity. Upon a board of any length, nail two small cross-pieces at the desired distance apart, hollowing them out in the middle. Take two pieces of iron barrel hoop, *a*, *a*, of the length required by the size of bunches to be made (about fifteen inches long,) and bend them in the form shown in the sketch, fastening them by a nail or two in the bottom. At the distance required by the length of the stalks, set a thin board, *b*; it can be nailed against the

end of the bottom board, cut off at the right distance. Spring the hoops open a little, and lay in the asparagus with its tops against the upright board, to even them. When full enough bring the tops of the hoop together, and slip over them a staple, flat chain link, or a bit of wood with a flat hole through it. Tie the bunches firmly, cut the butt ends off square; open the hoops, and you have a neat, round bunch, that will show well. As any one who has marketed asparagus knows, a little pains in bunching is well repaid in better prices and quicker sale.

Geared Windmills.

We present herewith an engraving, with latest improvements, of the Geared Windmill manufactured by the United States Wind Engine and Pump Company, at Batavia, Ill. We allude to this matter as one of interest to thousands of our subscribers, particularly in the West and far West. We are assured by those who ought to know that the time is near at hand "when a majority of all windmills purchased by farmers and

dairymen will be geared, so they can do their own shelling and grinding at home, saw wood, cut hay, fodder, ensilage, etc., etc., in addition to pumping water." This accomplished, and the Geared Windmill takes its place as one of the greatest modern labor-saving inventions. A Western correspondent writes: "The thirteen-foot Geared Mill is in great demand, and is ample for a farmer owning one hundred and sixty acres, and the usual head of stock on such a farm." As we have so repeatedly said in the past, settlers in the far West are too apt to run in debt for new machinery. Many bankrupt themselves by so doing. At the same time, those who have the means to do so, should invest in labor-saving contrivances because they are labor-saving; and then when they have them, they should take good care of them.

THESE CHESTER WHITE PIGS GIVEN AWAY.

The person who sends the largest number of subscribers to the FARMERS' MAGAZINE by May 1st, 1884, will receive a pair of these pigs. Second prize, an incubator. Third premium, a Trio of Wyandotte Fowls; also other premiums. (See conditions in magazine.)

There is perhaps no other breed of hogs the reputation of which, throughout our whole country stands higher than the Chester Whites. They have short heads, short legs, short hams, good shoulders, and are broad in the chest, giving them good lungs. The whole body is round, and of nice, plump, mellow appearance; the carcass is deep; the back perfectly straight; hams and shoulders very broad, with fine bone; also fine hair and smooth skin; the head is broad but small. They are invariably white, with lopped ears. They keep easily, will fatten at any age, and are very quiet. Our yards contain the finest specimens of this breed in the country.

"The Chester White Boar Pig, which I received from you arrived safe and sound. It is an elegant pig, a perfect beauty, and I can scarcely see how any improvement could be made upon it. I am perfectly satisfied with the purchase."—SAMUEL MILLER, SMITHVILLE, PA. "I received the pair of Chester White pigs promptly. They suit me real well. They grow so fast. Everybody thinks they are the prettiest little pigs they ever saw."—ADAM REAM, SCRIPPS SPRINGS, O. "The Chester White sow you sent me came to hand all right, and I am well pleased with your selection. She is the finest Chester White pig that was ever in this county, and is admired by every one that sees her."—WM. STOEHR, NEW BREMEN, ILL. "The Sow came safely to hand, and I am well pleased with her. She is a fine pig, and all you represented she would be, and more too. I am obliged. Have you any more, say two or three?"—J. B. BROWN, CENTREVILLE, MD. "Received the pigs all right. I am very well pleased with them. Think the boar cannot be excelled anywhere. One of my friends has already spoken for two of them if I have luck with them. I think you edit a first-class paper."—GEO. FREDERICK, LETONIA, O. "The Chester White sow, Lady Gardfield, has a fine litter of ten pigs. They are admired by all who see them."—JOHN W. THOMPSON, AMITY, N. Y. "The pair of Chester Whites are the nicest pigs I ever saw, and every person that has seen them thinks they are real beauties."—ALBERT KLINE, MANOR DALE, PA.

✓ We have fine pigs of all ages for sale at all times; also Berkshires, Yorkshires, and Poland-Chinas. Pure-bred Poultry of all kinds. The Farmers' Magazine and Rural Guide is certainly the best farmer's paper published for the price. It contains 16 large pages; has Departments for Horses, Cattle, Cows, Sheep, Swine, Poultry, Bees, Fruit Garden, and Household, and is only 35 cents per year. Do not subscribe for any paper until you have seen our price-list, as we send most publications at a much lower price than even the publishers themselves. Everybody can make money by soliciting subscribers for the Farmers' Magazine, as we allow liberal cash commissions, besides the valuable premiums mentioned in this advertisement. Send for free sample copy and terms to

POTTS BROS., Parkersburg, Chester Co., Pa.

RUPTURE.

"White's Patent Lever Truss" is a perfect instrument for the relief of Hernia. The use of steel springs, so hurtful, is avoided. An inward and upward power is obtained at the spot where it is needed. No pressure on the back. Pamphlets free. DR. GREGORY, 711 Broadway, N. Y.

Publishers,

DAVID W. JUDD, Pres.

751 BROADWAY, NEW YORK.

"Scotched not killed" may be said of a number of the thousands of humbugs that have received attention in these columns. In fact, now and then one turns up that got its quietus herein twenty years ago or more. Human nature changes slowly as a whole. Those who have had their "eye teeth cut" pass away and the new crop comes forward to go through the same process; some never get through with it. The swindlers are not all fertile enough in invention to get up new dodges, though some are quite expert at it; and the old hands often think it will do to try the old tricks upon new dogs. So it comes to pass that we have to often take in hand an old offender or a new one in his cast-off suit.—Further, many new readers are not so familiar as our old friends with some of the phases of swindling, and with some of those which have but recently been found in our Rogues' Gallery. The latter will bear with us, then, if they seem to see the return upon the stage of some familiar faces.

A CASE IN POINT.

Even those who have so long read these columns as to think themselves proof against imposition are not always so.—A farmer living near by called last week at our office to bring in a club of subscribers, which he had gathered, as for many years past, and to talk over some farm matters. He is a fair specimen of a sensible and business-like farmer. We know he is intelligent, for he has read this journal for thirty years, and as he reads, thinks, observes and studies his business, we can always learn something at least from him. Well, after an interview mutually pleasant—it was to us—he left. Later in the day he returned for a little private conversation. To our surprise even he had fallen among the rascals who prey upon strangers, even

"THE BANCO STEERERS."

It was the old, old story. A suave young man, well dressed, came up and called him by name. He professed to be the son of a neighbor of our friend, whom he knew to be a prominent citizen of his county who had several sons, and one or more of them in the city. The Banco man claimed to be one of these sons—"was in a bank here"—"was happy to meet an old neighbor of his boyhood," in short was very agreeable. He soon brought in adroitly his good luck in drawing two large fine pictures, and would his country friend like to see them, and indeed take one home, as he had only room for one.—Down a side street, and up stairs to an office where very solemn men were in attendance, our affable man was informed by the solemn attendants that there was \$500 waiting for him from a recent "drawing" for a charitable and religious object, of course. There were some tickets with numbers and stars on them—a regular "I win, you lose" arrangement. Our friend took a ticket and won and then—he lost. Having no ready money to pay the loss he gave his check, and departed a wiser man. He called to privately tell us what he had paid for the lesson, and to express his surprise that after reading all our warnings, he should be thus taken in, and to urge our repeating the warnings until no reader could forget them. Perhaps this narrative will save some others. At our suggestion he telegraphed his bank to refuse the check. In this case the loss was but a few dollars of money in hand, but he feels most the loss of confidence in himself. "He felt that a man like him, old enough to have cut several sets of eye teeth, should be taken in like a green horn was quite too much."—We do not think it shows so much greenness on his part, as the skill and shrewdness of the swindler. "Why," said our friend, "he came right up to me as if he had known me all of his life, and as there are many of his name in our county I tried to recollect him."—We hardly need to repeat our oft-given advice; in travelling, as well as in cities, and elsewhere,

REPEL THE ADVANCES OF STRANGERS.

The Union Detective Agency.

When the circular of this "Agency" came we looked at the bottom for "Cincinnati." But New York claims her share. This "Agency" will make "secret inquiries of every nature" in "every county in the United States." Any one can be a member by "filling out the enclosed blank and forward it with \$5.00 at once." Indeed, the circular before us is devoted more to telling how to send that \$5.00 than to defining the duties of the members.

Lotteries Here and There.

No long-time reader need be told that we regard lotteries, even when fairly managed, as prejudicial to the welfare of the community. The fact that many give their money in order that a few, who do nothing to deserve it, may draw prizes, makes it one of the meanest forms of gambling. By law, all letters and circulars relating to lotteries are excluded from the mails. But that "Royal" concern at St. Stephen, N. B., in defiance of the laws of Congress, still sends its schemes far and wide. It would seem that Congress, with a proper regard for its own dignity, should find a way to put a stop to this. Isn't it rather hard on our own swindlers to be shut out from the mails, while the "Royal" chaps, the "Blue-noses," can flood the country with circulars, tickets, and schemes of their lotteries over the border?

"Sprats to Catch Herring."

The cashier of a bank in Logan Co., Ky., informs us that a farmer presented a dollar bill, asking if it was genuine. After close examination the teller pronounced the bill good. The farmer received it in a letter, which offered him any quantity of the same stuff, fully equal to the sample. The cashier says that the bill is no doubt genuine; but that the recipient "did not bite," and is one dollar better off.

One of the oldest of all humbugs is the offering of, or rather pretending to offer, counterfeit, or "Queer" money. It has been thoroughly worked, and has appeared in many guises, yet they still come. One circular, purporting to be sent by Chas. Hayden, 744 Sixth Avenue, New York, is more blasphemous than any we have before seen. Its appeals to the Deity in asserting the truth of its claims are enough to make one shudder.

Superfluous Hair.

A correspondent in Ohio asks our opinion of the circular of a Philadelphia "University Chemical Preparation" for removing hair from the face, arms, etc. It is claimed that the preparation is not poisonous and "is based upon the nerring natural laws of matter, and can never fail." As we have not seen this preparation we can only judge of it on general principles. It has no right to call itself a "University Chemical Preparation," as no "university" has anything to do with it. Being false in its title, we have a right to suspect that its claims are equally false. But why remove the hair? Removal will only stimulate future growth. Some of the most estimable ladies of our acquaintance are thus annoyed, but they have the good sense to know that the regard in which they are held by their friends is not affected by a few hairs upon the face.

The End of "Fund W."

Flemming & Marion, claiming to be brokers in Chicago, not long ago flooded the country with their circulars, showing that an easy road to fortune was to subscribe to their "Fund W.," and allow them to speculate with the money. At one time these circulars were sent us in great numbers by our readers, who asked our advice about subscribing. Suddenly the "Fund W." circulars ceased to come. The Post Office Department refused to allow Flemming & Marion to do business through the mails, and as a consequence the firm came to grief, and the "Fund W." could not be operated. One of the firm went to Canada to avoid arrest, but found he "was wanted" by creditors there. Escaping from the officers of the Dominion, he took refuge in Dakota, but was arrested there; at last accounts he was awaiting trial in Illinois upon a charge of obtaining money under false pretenses. We shall probably hear no more of "Fund W."

"Storm Glasses," So Called.

A Postmaster in N. C., writes us that parties in Indianapolis, Ind., offered to send, for a certain sum, "a Thermometer and Storm Glass combined." The parties offering the affair having sold out, their successors propose to send the instrument for fifty cents additional. The N. C. Postmaster asks if this is not a case for our Humbug Column. This whole "Storm Glass," or "Weather Glass" business, is a humbug. The so-called "instrument" consists of a thermometer, and a tube about six inches long, and as large as one's little finger, containing a liquid. It is claimed that this liquid becomes cloudy when a storm is at hand, and when it clears, fine weather is to be expected. The liquid is diluted alcohol, holding in solution Sal Ammoniac, and other salts. A maker of excellent thermometers in the suburbs of New York, a few years ago proposed to add these "Storm Glasses" to his thermometers. He sent us two of the instruments for trial, and after a few days, called at our residence in the country, to learn the result. When he came, both instruments showed that clear weather was prevailing. We then placed one of

the instruments in the refrigerator, and soon had a violent storm predicted, while the other remained as clear as before. This showed that the "Storm Glass" is only affected by temperature. When the liquid it contains is cooled, the salts crystallize, and it becomes cloudy. As a weather indicator, it is quite worthless. Our thermometer maker, being an honest man, did not add the "Storm Glass" to his instruments.

The Blind Leading The Blind.

If Messrs. Chas. Pruditt & Co., German, Mo., are not humbugs, they are unfortunate in their manner of advertising. C. P. & Co., have evidently come into possession of a small printing press, and know very little about using it. Their circular has the merit of brevity, and is printed in large type, on a small sheet of note paper. It reads:

"WE Being informed of F your GOOD & Reliable Standing in Business This Induces us to communicate with you by Letter We would be glad to Initiate you in a New pleasant and very Profitable Business it is Something ENTIRELY NEW nothing to sell or peddle No other Firm in THE US Devoted TO THE Business Avail yourself of this offer—& we will Pay you a Salary IF you work for us only during yours pare moments From \$5 to \$50 Per month according TO YOUR Service Return us this letter with only a \$1 Bill or stamps & we will send you FREE by mail our Complete Working Outfit You can then work For us or yourself Regular

Price \$5 This offer is good for 30 Days For our Fair Dealing SEE MO Directory Here write Address Don't ask for description of Outfit We only initiate Purchaser."

This is a curiosity in the way of a circular. We have given it *literatim*—and were about to say *punctatim*, only it don't *punctate* at all. Indeed, there is not a particle of "pepper and salt" in the whole mess. We do not wonder that the Colorado Postmaster was in doubt as to its contents.

How Postmasters are Tempted.

A personal friend, who is, as was his father before him, Postmaster in a small rural district, in New York State, sends us a circular to show the offers made to Postmasters. A concern, which modestly calls itself nothing less than the "World's Dispensary Medical Association," asks our Postmaster friend to furnish (on a blank enclosed for the purpose), "the name of every person whom you know to be suffering from any chronic or lingering disease (however slight it may be), indicating also, if known to you, what the disease is, or has been pronounced by home physicians; also the names of all other people, not to include more than two in any one family, and omitting the names of physicians. [We should say so, Eds.], and only including those who obtain their mail through your office." The Postmaster who does this, is offered some kind of a book, and he has also a "numbered receipt," good for one of the presents valued at from twenty-five cents to six thousand dollars, "in our next Grand Distribution." Here is an offer to the Postmaster to sell the knowledge he has acquired of his patrons, and also to take a chance in a "Distribution," which is but another name for a lottery, which is forbidden by the law of the State, and shut out from the mails he handles. This "Dispensary" concern also wishes Postmasters to send lists of people afflicted with all sorts of diseases. If other Postmasters will so far violate the proprieties as to comply with the requests made in the circular, sent out by this "Dispensary," the Post Office Department, under its present head at least, will soon dispense with their services. The concern says, "We want the names of all invalids." When you tempt Postmasters into taking part in a lottery, we are tempted to say, "Physician (if you happen to be one), heal thyself."

"The Wonderful Tree Bean of Mexico."

Sometimes one is unfortunate in the style of his advertisement. The "Tree Bean" was advertised by a party in Wisconsin in a manner that made us suspect that it was the same plant which was offered a few years ago from a small town in Tennessee as a "Tree Pea." In our notice of the "Tree Bean," in November last, we asked those who had tried it to send us specimens. The responses have been numerous; they indicate that there are at least two, possibly three, distinct beans claiming to be "tree"-like in their growth. The correspondence relating to these "Tree Beans" is already large, and the specimens sent vary from a few beans in an envelope to the whole plants in a box. We are warranted in saying that the "Tree Bean" offered by the dealer in Wisconsin, is a bean, and a very prolific one. As to its Mexican origin and its real value, as well as that of similar beans, we may have something more to say hereafter.

Market Gardeners,

And all who want good, fresh seeds cheap, direct from the farm, are requested to send for my Seed Catalogue for 1884. There are no better or cheaper seeds. Catalogue, with directions for cultivation, free. Please send for it. Address, JOSEPH HARRIS, Moreton Farm, Rochester, N. Y.

DO YOU KNOW

That you can get a year's subscription to the *Century Magazine*, for \$1.93; to *Harper's Monthly* for \$1.57; to *Harper's Bazar* and *Harper's Weekly* for \$1.98 each; to the *Atlantic* for \$1.98; to *St. Nicholas* for \$1.37; to *The Youth's Companion* for 47 cents; to the *New York Weekly Tribune* for seven cents—and to any other periodical in the world at equally astonishing discounts from the regular prices? These rates are actually given to all subscribers of the above, if taken at the same time with **THE CONTINENT** [Judge Tourgee's Weekly Magazine]. The following are a few of the combinations we make to those subscribing at once:

COMBINATION SUBSCRIPTION RATES.

	Regular Rate.	By Single Copies.	Our Price for the two
The Continent, \$1, and The Century, \$1.....	\$3.00	\$3.40	\$5.98
The Continent, \$1, and Harper's Magazine, \$1.....	8.00	9.40	5.57

The Continent, \$1, and Ethnological Journal, \$2.....	6.00	8.20	4.27

A HUNDRED MILLION DOLLARS

Are expended every year by the American people for their periodical literature, with very little idea of economy in the transaction, such as business wisdom dictates in the wholesale purchase of other commodities. The above offers give the individual purchaser the advantages of wholesale rates, with no agents or middlemen of any kind—the subscriber getting the whole advantage. The list given above is only an example of what we are prepared to offer to all who include **THE CONTINENT** in their lists. If you are going to take any of the periodicals named, or any others, submit your list for our estimate. It will defy competition.

As to **THE CONTINENT** itself, the *New York Observer* says: "It ranks in literary merit and artistic quality with the best and oldest-established magazines in the country," and the poet Whittier said, in renewing his subscription: "It has more than fulfilled its promises; I cannot do without it." **THE CONTINENT** has been lavish of promises, and has fulfilled every one. It will fulfill these. We are glad to answer inquiries. Let us know what you want. Specimen Copies sent on application.

Subscriptions to **THE CONTINENT** and other periodicals may begin with any number of either. Be sure and state when you want each to begin. Remit by draft or money order. The **NEW POSTAL NOTES** are just out, and will be found very convenient in remitting odd sums of money. The above figures are "odd" enough; that is, because they are figured down to the lowest cent for your advantage.

SEDGWICK STEEL WIRE FENCE

It is the only general-purpose Wire Fence in use, being a strong net work without bars. It will turn dogs, pigs, sheep and poultry, as well as the most vicious stock, without injury to either fence or stock. It is just the fence for farms, gardens, stock ranges, and railroads, and very neat for lawns, parks, school lots and cemeteries. Covered with rust-proof paint (or galvanized) it will last a lifetime. It is superior to boards or barbed wire in every respect. Wens for it a fair trial, knowing it will wear itself into favor. The Sedgwick Gates, made of wrought iron pipe and steel wire, defy all competition in neatness, strength, and durability. We also make the best and cheapest all iron automatic or self-opening gate, also cheap and most perfect all iron fence. Best Wire Stretcher and Post Auger. For prices and particulars ask hardware dealers, or address, mentioning paper, SEDGWICK BROS., Mfrs, Richmond, Ind.

FAY'S WATER-PROOF BUILDING MANILLA.

(ESTABLISHED IN 1866.)

This water-proof material, resembling fine leather, is used for roofs, outside walls of buildings, and inside in place of plaster. Made also into carpets and rugs. Samples and Catalogue free.

Each person must send 25c. with their answer for which they will receive three months' subscription to the *Home Guest*, a 50-page Illustrated *Holiday Book*, a *Case of 25 articles* that the ladies will appreciate and paper containing the names of winners. PUBL. HOME GUEST, HARTFORD, CONN.

Kind Words.

Ten Years' Trial.

RUGBY, Tenn., Sept. 25, 1883.

"I am grateful for the many good things received through the *American Agriculturist* during ten years' trial of it." M. S. PERCIVAL.

30 and 40 Year Subscribers.

Mr. JAMES MATHEWS, of Poulney, Vt., writes under date of December 1:—"I suppose I am one of your oldest subscribers, being 34 years old, and have taken your paper for thirty years."

Nov. 26, 1883.

Mr. OWEN BIDDLE, of Philadelphia, Pa., 1230 Pine street:—"Please find \$1.50 enclosed, to renew my subscription. I have taken your paper for about forty years, and am nearly 80 years old."

Continue It Indefinitely.

BADEN, Pa., Sept. 28, 1883.

"Continue my subscription indefinitely. It is the best paper of the kind I have ever seen."

C. W. CAMPBELL.

Exposing Frauds.

LYNN, Penn.

"I am a painter by trade, but I have to read the *American Agriculturist*. You are doing a noble work in exposing frauds and humbugs. Keep on, keep on, God bless you."

V. H. LYMAN.

Well Pleased.

TIDIOUTE, Pa., Nov. 20, 1883.

"I have received your paper; also the Dictionary and Picture. Am well pleased with them, the Picture alone being worth the price of all. Please accept thanks for same."

C. B. McCORMICK.

A Splendid Premium.

TOPEKA, Kans., Nov. 13, 1883.

"Have received the October and November numbers and Engraving, all right. They are very nice, and with Dictionary, previously received, make a splendid offer to new subscribers for 1884."

C. H. BARTON.

Great Improvements.

OLEAN, N. Y., Oct. 16th, 1883.

"I am pleased to see the great improvements made in all departments. The highest order of engravings I ever saw in a newspaper. I herewith remit a money order for subscription for the coming year."

D. CARPENTER.

A Soldier Subscriber.

MADISON BARRACKS, SACKETT'S HARBOR, N. Y.,
Dec. 6, '83.

"Please receive my subscription for another year, and send the picture. If Dictionary is given to old subscribers, send that. I have been on your books for five years, and although my calling, that of a soldier, has no direct connection with agriculture, yet I find it the most instructive of journals, and intend to keep up my subscription regularly."

LIEUT. C. H. OSOOD.

An Anxious Son.

PARKERSBURG, W. VA.

"Allow me to compliment you a little on the October *American Agriculturist*; it certainly surpassed all previous numbers. My son looks forward each month to the coming of the *American Agriculturist*, and about the 15th of each month he begins saying, 'Father, is it about time now for it?' Each number contains some little convenience for the kitchen, which he generally makes, having a large kit of tools of all kinds and a nice chest."

R. A. JONES.

"No Chance for Improvement."

NELIGH, NEB., Dec. 3, 1883.

"I think the *American Agriculturist* the best book for the general farmer I ever read. I fail to see where there is a possible chance for improvement."

CHAS. W. DENNIS.

COE RIDOR, CUYAHOGA CO., OHIO.

"The Budding Knife I received as premium last year, is the best knife I have ever used."

A. M. COE.

Every Farmer Should Have It.

WOODVILLE, MINN., Oct. 20th, 1883.

"I would regret very much to be deprived of the *American Agriculturist's* practical and instructive suggestions, and I have realized a hundred times its cost, by applying these suggestions. Be assured I will do all I can to get it into the hands of every farmer."

G. T. McGEHEL.

DAVIS, ILL., Oct. 11th, 1883.

"As I like the *American Agriculturist* very much, and think every farmer should have it, I will help you all I can in getting subscribers."

PROF. J. A. GOING, P. O. Box 933, New York City.

SPECIAL PREMIUMS.

Dickens' Complete Works. PRICE \$22.50.

In fifteen volumes, 12 mo., handsomely and uniformly bound in extra cloth, black and gilt, in large clear type and beautifully illustrated. This elegant set of the complete works of Charles Dickens will be presented to any person who will send us fifteen subscriptions to the *American Agriculturist* at \$1.50 each; or, will be supplied for the price. The set will be delivered at 751 Broadway, (or sent by express for which receiver will pay.)

Irving's Works. PRICE \$8.50.

In three imperial 8vo. volumes, elegantly bound in uniform style, with gilt back and side stamps. The first volume also contains a "Life of Washington Irving" by Richard Henry Stoddard. These three handsome volumes, including all excepting the "Life of Washington," would be welcomed as a present, or would prove a valuable addition to any library. They will be presented to any person sending us eight subscriptions to the *American Agriculturist* at \$1.50 each; or, supplied for the price. Delivered free at 751 Broadway, or if forwarded, receiver will pay expressage.

Solid Gold Hunting Case Watch.

This elegant gold watch, which we have secured as a Special Premium, is supplied to us by Cummings & Co., whose reputation is a guarantee for the watch, and whose watches have been furnished by us for the last six years. The works are imported from Switzerland, the case is made in this country, and the whole are put together under the supervision of Cummings & Co. The works are thirteen jewels, nickeled movement, cut expansion balance. The case is made of solid gold and every way substantial. The back and front are most elegantly engraved, and present the appearance of a two hundred dollar watch. It is a stem winder and setter. Two of the gentlemen connected with the *American Agriculturist* have made a thorough test of these watches, and they find that the variations are very slight. These watches are warranted to us by Cummings & Co. as excellent time keepers. This watch is one of the most beautiful patterns of gold.

It presents a most elegant appearance, and will be worn with satisfaction by any gentleman. The engraving conveys an idea of the general appearance of the watch, with the exception of the superb chasing on the back, which is not shown. We will present one of these elegant watches, post-paid, to any one who will forward us only 52 subscriptions at \$1.50 each.

Premiums! Premiums!

MOST DESIRABLE PREMIUMS for those securing subscriptions to the *AMERICAN AGRICULTURIST* (English or German,) for 1884. A complete illustrated 32-page descriptive list of these articles mailed free to any address.—Any of the articles named below **CAN BE PURCHASED OF US AT THE PRICE GIVEN.** All articles marked with a * are sent prepaid by mail or express, to any point in the United States.

WE WANT 1000 more BOOK AGENTS for the grandest and fastest selling book ever published, entitled OUR FAMOUS WOMEN

For Thrilling Interest, Romantic Story, Spicy Humor, and Tender Pathos, it is without a peer. Just completed by 20 of our greatest living Authors, including *Elizabeth Stuart Phelps, Harriet Prescott Spofford, H. B. Noyes, Rose Terry Cooke, Lucy Larison, Mary Clemmer, Marion Harland*, and 18 others. They give, for the first time, the true Story of the Lives and Deeds of our famous women. It is Superbly Illustrated. Ministers say "God speed it." Tens of thousands are waiting for it, and Agents sell 10 to 20 a day. **Get Positively the best chance to make money ever offered.** Send for Circulars, *Extra Terms*, &c., to **A. D. WORTHINGTON & CO., Hartford, Conn.**

A LITERARY CURIOSITY:

The Apocryphal Books of the New Testament, rejected on the First Revision by the Council of Nice, under Constantine, A. D. 325.

The books that exist, of those not included in the canon, are carefully brought together in the present volume; and the possessor of this and the New Testament has in the two volumes a collection of all the historical records relative to Christ and his apostles now in existence, and considered sacred by Christians during the first three centuries after his birth. Illustrated from Ancient Missals. 8vo. Cloth, **\$1.50** post-paid. Send for Circular. **GEBBIE & CO., Publishers, 619 Sansom St., Philadelphia.**

AGENTS WANTED.

I have a new and rich work of rare attraction and value. Over 2,000 illustrations, nearly 1,200 pages in a volume—never before equalled for the **FARMER, STOCK-RAISER, or GARDENER.** 40 Colleges and Specialists have contributed to this Great Work.

AGENTS WANTED I think the endorsements are unparalleled and that its sale offers a chance to make money not equalled elsewhere in the book-line to-day. Investigation solicited! A valuable pamphlet free! A confidential proposition to those open for an engagement. Address **W. H. THOMPSON, PUBLISHER, 404 Arch St., Phila., Pa.**

REMARKABLE POTATO YIELDS FROM THE MAPES MANURES.

EXTRACTS FROM POTATO CROP REPORTS WHERE THE MAPES POTATO MANURE WAS USED.

355 Bushels "Mammoth Pearl" on one acre, second application of the Mapes Manure.

240 Bushels, same variety, per acre on balance of field, (20 acres.)
W. S. COMBS, Freehold, N. J.

684 Bushels "Eximius" on 57 rows—less than one acre. Four rows of the 61 rows making a measured acre were swept away by a flood.
ALFRED ROSE, Penn Yan, N. Y.

Mr. Alfred Rose also reports yields on experiment plots (100 rows) with new varieties as follows: "New Invincible," **960 Bushels** per acre. "Rocky Mountain Rose," **948 1-2 Bushels** per acre. "Eximius," **846 Bushels** per acre.

Protection from Wire Worms, Scabiness, etc.

450 Bushels (Early Rose) with two bags (400 lbs.) of Mapes Potato Manure per acre. Where 40 loads Cow and Hen manure were used yield was only 120 bushels per acre, and as Dr. Henry Stewart writes, "quite a half of this part of the crop (with cow and hen manure) was completely destroyed by wire worms and not more than half those saved would be fit for sale." "Not a potato of those grown with the Mapes Potato Manure is touched by the worms enough to hurt it." Dr. HENRY STEWART's report of experiment on one quarter of an acre, Hackensack, N. J.

473 Bushels "Early Rose" per acre. HENRY HOLMAN, East Hartford, Conn.

Send postal for forthcoming pamphlet, containing reports from practical, well-known TRUCK, FRUIT AND SPECIAL CROP GROWERS. Many of these growers use twenty tons and upwards of the Mapes manures in a season. Address

THE MAPES FORMULA AND PERUVIAN GUANO COMPANY, 158 Front Street, New York.

THE MAPES ORANGE TREE MANURE—Supplied from New York, or Jacksonville, Fla. Send for Pamphlet.

300 Bushels "Beauty of Hebron," and over on one half acre, equal to over 600 bushels per acre.
HENRY LATHROP, South Windsor, Conn.

Mr. W. F. ANDROSS, East Hartford, Conn., writes Jan. 1, 1884: "The acreage of Potatoes in this vicinity was more than doubled, the reason for which is attributable, I think, to the fact that the Mapes Potato Manure has so invariably insured success that the farmers felt a confidence which has never been warranted by any other method of applying fertilizers."

One of the Largest Yields on Record.

Yields on experiment plots during the past season, with the Mapes Potato Manure, on many new and some old varieties at Rural Farm (E. S. Carman, Proprietor), at River Edge, Bergen Co., N. J., are fully reported in the successive weekly numbers of the "Rural New Yorker," during months of Sept., Oct., Nov. and Dec., 1883. They include some of the largest yields on record, and challenge the closest scrutiny and criticism. The yields are from 700 to 1140 bushels per acre. The yield 1140 bushels per acre, "the greatest ever secured at the Rural Farm," was of variety Corliss' Matchless. Illustration and description in "Rural New Yorker," Dec. 8th., 1883.

J. S. ALLEN, Broad Brook, Conn., writes Jan. 1st., 1884.—"I have never had a failure in my potato crop, since I have used the Mapes Potato Manure (four years since). Four bags per acre will give me a better crop of potatoes than 30 loads of barnyard manure. It gives better crops, and the effect seems to be as lasting."

THE Singers' Welcome.

Singing Class Book by L. O. Emerson, is having great success, is in every way a good book for the teacher and learner, with the best of music, and improved elements. Has received decided praise from those who have used it in their fall classes, and they are quite willing to recommend it to all commencing winter classes. 192 pages. 100 secular and 50 sacred tunes, improved elements, &c., &c. Order it with perfect confidence.

(Continued from last month.)

How Watch Cases are Made.

The many great improvements introduced in the manufacture of the Jas. Boss' Gold Watch Case, have led to similar improvements in the making of silver cases.

Under the old methods, each part of a silver case was made of several pieces of metal soldered together, requiring a great amount of cutting and soldering, which softened the metal and gave it the pliability of lead rather than the elasticity of silver.

Under the improved methods, each part of the Keystone Silver Watch Case is made of one solid piece of metal hammered into shape. The advantages are readily apparent, for every one knows that hammering hardens the metal while soldering softens it.

To test the superiority of the Keystone Silver Watch Case, take one of 3 oz. weight, press it squarely in the center when closed, and it will not give, while a case of same weight of any other make will give enough to break the crystal. The Keystone Silver Watch Case is made only with silver cap and gold joints.

Send 3 cent stamp to Keystone Watch Case Factories, Philadelphia, Pa., for handsome Illustrated Pamphlet showing how James Boss' and Keystone Watch Cases are made.

(To be continued.)

For Humbug exposures, book reviews, business announcements, etc., see the last pages of the paper.

Begin any Time.

You can begin your subscription to the *American Agriculturist* with any number, inasmuch as every issue is complete in itself. Please forward your subscription lists at once, however.

Our Premium Guns.

The Guns which we offer elsewhere as Premiums for subscribers to the *American Agriculturist*, are proving more than satisfactory. Indeed, both of them are better than we had supposed we could furnish for the money. With scarce an exception, every person procuring these from us, express satisfaction. For Testimonials regarding these Guns see another page.

Premium List.

We have issued another edition of fifty thousand of our Premium List, which will be mailed, post-paid, to those of our friends who desire to raise clubs for the *American Agriculturist*.

New Premiums.

See another page for Special Premiums for subscribers to the *American Agriculturist*.

"Foes or Friends?"

This beautiful engraving elicits praise and admiration in every quarter. It is supplied to every subscriber, new and old, on receipt of ten cents extra for packing, postage, etc.

The Six-Hundred Page Dictionary.

We continue to offer the New American Dictionary as a Premium for new subscribers, though ten cents is now required for postage. Send for circular giving a detailed description of this valuable Dictionary, if you have not one already.

Sample Copies.

We continue to furnish free to canvassers, sample copies of the *American Agriculturist*, Show Bills, Circulars, etc., etc.

Music FOR THE Millions.

The homes of nearly all of our readers, however humble, are doubtless cheered and enlivened with some musical instrument or another. Sheet music ordinarily retails all the way from thirty-five cents to a dollar apiece. Some, of cheaper character, published on poor paper is hawked through the country at lower figures. We have made arrangements to supply, without cost, all the readers of the *American Agriculturist* with the latest sheet music printed on the best music paper, full size. A large list of this music is presented on two pages, elsewhere. Any new subscriber to the *American Agriculturist* for 1884, or any one sending us a new subscriber at the regular rate, \$1.50 a year, can order from us any twelve pieces of this music, and it will be delivered free here or sent post-free to any point in the United States or British Possessions, on receipt of ten cents for postage. Here is a splendid opportunity, which every one desiring instrumental or vocal music should embrace.

Prepare well for the busy work of spring. Read the very valuable suggestions given on page 56.

Horses.—Don't forget to daily exercise your brood mares. Overfeeding ruins as many horses as overwork. Keep the stable clean and stalls well littered.

Cattle.—Feed sliced roots or potatoes once or twice a week, as an appetizing change in the rations. Milch cows require careful handling, as they approach the time of calving. Raise only the best calves from superior animals.

Sheep.—Those grown for wool thrive on a mixed ration of bright straw, hay and grain. Early lambs are profitable, but need constant care when they first come. Old sheep for the shambles should be pushed forward rapidly with a daily grain ration.

Swine.—Young pigs require warm and comfortable quarters, and a thick, dry, cut-straw bed.

Poultry.—Laying hens thrive with much sunshine and plenty of food, both green and dry, with a full supply of pure water, and some form of lime.

The whole subject of feeding farm animals requires most careful study by all keeping them, and especially during the winter season. The attention of all practical stock raisers is directed to the prizes offered on page 47, for essays on the keeping of the various kinds of live stock of the farm.

Kitchen and Market Garden.

Market gardeners know the importance of doing certain things at a given time—a date which each has found to be best for his particular locality, and knows if he varies from this but a few days, his crops may be so far behind those of his neighbors as to seriously affect his returns. Market gardeners need no reminder to do this or that, as their success depends upon observing the times for sowing, planting, etc. Not so with the farmer and others, whose gardens are to supply the family table. The garden with most farmers is a secondary affair and often neglected to their loss and to the discomfort of the family. Such need to be frequently reminded of the things to be done. There is no reason why every farmer's family should not enjoy the best vegetables, and as early as any one, save those who buy vegetables brought from the South. To have early vegetables the seeds must be sown early. Few farmers care to give the attention needed by a hot-bed, but quite as good plants may be raised in the windows of the house with scarcely any trouble. All the plants needed for the family garden, of early cabbages, lettuce, cauliflowers, tomatoes, etc., may be raised in boxes, as described on page 65. Try it, and another year it will come as a matter of course. It takes about six weeks to raise plants from the seed, large enough to set in the open ground, and this will govern the time of sowing. Cabbages are nearly hardy, while tomatoes, being very tender, cannot with safety be set in the open ground until "corn-planting time," and must be sown later.

Good Vegetables will only come from good seeds. One cannot afford to sow doubtful seeds. Those

of uncertain age or without labels and of doubtful source, should be burned and a fresh stock ordered.

Selecting and Ordering Seeds.—The catalogues are out this month, and dealers will gladly send to those who ask for them, while the mail, as has been well said, gives every one, no matter where he may live, "a seed-store just around the corner." Novelties are offered every year. Order these for experiment, but for the main crop rely only on tested and well-established varieties. Order early.

Peas are of two classes, the round and the wrinkled. The latter kind, if sown in cold, wet soil, will rot; the round peas are hardy and may be sown as soon as the ground thaws. Make a drill three or four inches wide, with the hoe, and scatter the seed peas in it, so that they will be about half an inch apart, and cover with two inches of soil.

Plants in Cold Frames.—Remove the sashes whenever the thermometer is not below thirty-two degrees. If the soil in the frames is not frozen when the snow falls, clear it from the sashes. Otherwise the snow may remain a week without injury.

Be all Ready for Work.—As soon as the ground thaws there will be no time for odd jobs. Finish up all the work of preparation at once. Repair implements; provide duplicate breakable parts. See to the work harness. Provide stakes and labels. Ont pea-brush; lay it on level ground and weight it with rails or logs, to flatten it. Procure bean poles; a set of red cedar poles will, if cared for, last many years. In a thaw dig the parsnips and salsify left in the ground and take out all the horseradish, whether wanted for use or not, to prevent its becoming established, when it will be difficult to remove, and prove an annoying weed.

Orchard and Nursery.

A New Orchard.—One about to plant trees can hardly give too much thought to the selection of varieties. Procure catalogues and study them. An orchard for home-use should yield fruit for every season. For a near market, early fruit is usually the most profitable. In selecting later varieties have but few sorts, and those of kinds generally in demand. Order all fruit trees early.

Old Orchards in the older States are more numerous than young productive ones. The land is exhausted by bearing two crops these many years, a crop of fruit and one of grain, hay or some other. If the trees are still sound they may be renovated, but not unless the soil is also renovated. Providing food for the trees is the first step. Manure may be hauled out while snow is on the ground. A liberal dressing turned under by a shallow plowing, and keeping off all crops, unless it be clover to be pastured by swine, are essential.

The Trees.—In a damp time cover the trunks and large branches with soft soap, made thin enough to apply with a brush. Prune away all crowded and superfluous branches, to form an open head.

Grafting Old Trees.—If the fruit is poor and the trees sound and healthy make a new head by grafting with desirable sorts. In renewing an old tree it is better to extend the work over three years, grafting the lower third first and the upper third last.

The Fruit Garden.

Pruning.—If any pruning was left unfinished last fall, complete it in the first mild spell.

Dwarf Pears.—With the exception of Duchesse d'Angouleme, and perhaps Louise Bonne de Jersey, standard pear-trees are preferable to dwarfs as a matter of profit. If one wishes to raise many varieties in a little space dwarfs will do this.

Supports for Vines, including trellises for grapes, should be made ready. The woodwork may be painted, or treated with several coats of petroleum.

New Plantings.—If it is intended to set out shrubs, etc., the coming spring, the selections, whether for home supply or for market, should be made while the matter can be properly considered.

Grape Vines.—Occupy all the available places with vines, planting them wherever there is a barn or other surface against which they can be trained.

Flower Garden and Lawn.

But little out-door work can be done in the ornamental grounds this month. It is important to guard against injury to shrubs and trees by animals. If pruning is needed, do it on mild days.

Hardy Annuals.—To have early flowers sow seeds in the window boxes described elsewhere. Candy-tuft, Ten Weeks' Stocks, Pansy, and other hardy kinds may be sown and the plants thinned or transplanted to other boxes. The Pansy, which fails to give fine flowers in hot weather, if sown in this manner may be had in bloom early, and at its best.

Manure for the Lawn.—Reserve enough of the most thoroughly decomposed and fine manure for top-dressing the lawn. In the absence of this, apply ashes, nitrate of soda or some other fertilizer.

Plants from Cuttings may be propagated now for planting out in the garden. Verbenas and other plants which form root readily, may be propagated in window-boxes, described elsewhere for sowing.

Green-house and Window Plants.

As the sun becomes more powerful, bloom will be abundant and plants will start into growth, and need more water.... *Ventilation* can now be given more freely, especially to window plants....

Insects will increase more rapidly and will demand attention. Those who give their window plants daily care, are able to stop the first attacks of insects, and save much future trouble. Fumigation with tobacco smoke, is best for the greenhouse, but is not easily practicable with house plants. For these showering with tobacco water is best.

Tobacco Tea.—Pour boiling water over tobacco stems, or other cheap form of "the weed," and when cool dilute it to the color of strong tea, sprinkle the plants with it, or what is better, having the liquid in a pail or tub, dip the plants in it.

The Red Spider, because so small and not always "red," and living mostly on the under side of the leaves, is often an unsuspected cause of much injury to window plants. Moisture is the best remedy; go over the leaves, especially the under side, with a soft sponge, using very weak soap suds.

The Mealy Bug, so-called because it is covered with a mealy powder, is often a great pest. It is usually in the forks of the stems, and may be picked off with a small sharp-pointed stick.

Faded Flowers.—Flowering is very exhausting to a plant, and seed-bearing is still more so; as soon as flowers begin to lose their beauty they should be cut away before the formation of the seeds begins.

Roses.—The stems that have borne flowers should be cut back to a strong bud, which will soon push.

Camellias, when flowering is over, will make their yearly growth rapidly. The plants may be given a warmer place and will require more water.

A Convenient Ground Marker.

Now is the time to get up things needed when the busy spring comes. Mr. L. D. Snook sends us a sketch and description, from which we condense the following: A simple implement for marking out rows at various distances apart, can be made by any one at home. A piece of pine or other timber, two to three inches square, and two to four feet

long, is bored through with holes on all sides, at various distances apart, those on each side being all of the same distance from each other. A large hole in the center in two directions, receives the handle. The other holes and marking pins to fit them, may be of any size desired, and the pins be quickly changed from hole to hole, as required by different plants. With the handle removed, or fastened in, this can be stored away in small space.

Feeding and Care of Farm Animals.

Prizes Offered.

Plain and practical directions for the keeping of all kinds of Farm Animals are always valuable and welcome, and with this in view the Publishers of the *American Agriculturist* offer prizes for Essays upon the *Feeding and Care of Farm Animals*. Horses, cattle, sheep, swine and poultry are the leading kinds of live stock on a farm, where a system of mixed husbandry is successfully practised, and each Essay must treat of at least three of these, as to their feed, its storage, kinds, cost, etc., followed by the proper care of the animals both in the pasture and under cover. In short the essay should include all the important points in the keeping of the farm animals treated. The order of treatment should be as given above, and if other kinds of live stock are included, they should follow the poultry. The cash prizes for these essays are:

For the Best Essay.....\$50.00

For the Second Best Essay..... 40.00

For the Third Best Essay..... 30.00

The essays are to be plainly written in black ink, on one side of plain white paper, and should not exceed eight thousand words. Sketches may be made whenever they will add clearness and force to the text. The essays are to be sent to the Editors of the *American Agriculturist* on or before May 1, 1884, in a sealed parcel (not rolled) and with an assumed name. Place the real name in a small sealed envelop accompanying the essay, and bearing the assumed name upon its outside. All essays submitted for the prizes become the property of the *American Agriculturist*.

We wish the experience of the practical farmer, and therefore this offer is open to any one who has attained success in the keeping of farm animals. The field is a broad one, and it is therefore all the more essential that each part be concisely treated. Diseases, and the care of young stock are not the least important topics to be considered in the essay.

A Ladder Quickly and Cheaply Made.

A good strong but light ladder on every farm is almost indispensable, and two or three of different sizes are generally desirable. Where a better one is not available, one can be improvised in an hour or so that will answer many purposes.

For the main support use a scantling of any desired or available length, and three by four inches thick—the size depends upon the kind of timber and its strength, and the length of ladder required. Across this nail at the desired intervals, strips ten or twelve inches long, two to three inches wide, and an inch thick. Three or four strong nails should be driven in each one of the several steps, to give strength and safety. A cross piece on the upper end and two side braces (as shown in the illustration) will prevent such a ladder from turning on its axis. If not needed longer the steps and braces can be quickly knocked off, and the timber turned to account otherwise.

A "Cat" Scare-crow.

Mr. Charles Lauppe, Urbana, Ohio, keeps the birds from his grapes with a scare-crow "cat." This "animal" is made of Canton flannel, of the color of a malted cat, stuffed with curled hair. Hair is better than wool or cotton, as it soon dries out after a rain. A "cat" of this kind will effectually protect the grapes from birds for twenty feet on all sides. Mr. Lauppe sets his "cats" upon the grape trellises, where they may be secure and in full sight of birds wishing to plunder.

A Remodelled Barn.

2D PRIZE.—BY JOHN MORRISON, JR., OLAN, ONTARIO.

The average farm barn found in very many sections of the country is fairly represented in the elevation, figure 1, and the floor plan. Around this structure there generally gathers, as time goes on, necessity dictates, and circumstances allow, a series of other out-buildings without any pre-arranged plan. The owner is forced to admit that many inconveniences are caused through lack of forethought and definite plan; he has wasted more time, which means money, than would have erected all

Fig. 1.—SIDE VIEW OF A COMMON BARN.

the buildings he possesses, two or three times over. I submit herewith a plan for using the original barn as a starting point, and constructing a building neat and tasteful in design, convenient of access to every part, and containing (fig. 3) sufficient room to accommodate twenty full grown cattle, three horses, from thirty to forty sheep, according to age and size, a carriage-room with space for a double carriage and single buggy or cutter, and a commodious harness-room in the corner of which is an oat box four feet square. This last is accessible by a sliding door starting from the passage way and is adjacent to the mangers, thus saving extra steps. All the animals can be fed from the head by the continued passage way, which goes entirely around the building. The hay and feed can be dropped into the passage from the barn mow, and at threshing time the rough straw can be stowed in the lofts over the stables, so as to be dropped through trap doors when needed for bedding. This remodelled plan includes also a root cellar for eight hundred bushels, connecting direct with the passage way of the cattle stalls. Where roots are not raised, but corn alone is fed, the cost of this cellar (about one

Fig. 2.—INTERIOR OF COMMON BARN.

hundred and fifty dollars) can be saved and deducted from the estimate. Figure 3 gives the ground plan, and figure 4 shows the side elevation, representing the remodelled barn with internal arrangements which are described as follows:

This model can be worked on to any barn of the form shown in figure 1, no matter what the dimensions. A difference in size will be all the alteration required from the plan here shown. The most of these old barns are set on blocks about two feet above the ground; the new portion I have elevated only six inches as it is warmer and gives more room. The ceilings should be seven feet high by the plan, and no sill should be placed across the space opposite the barn floor, in order to leave room to drive out through from the barn.—In the estimate I have given the market prices of lumber here. In this section the owners take out all the scantling and rough lumber themselves, and this reduces the cost about fifty dollars. This, with the cost of the cellar, if omitted, makes two hundred

dollars, leaving the expenses of remodelling the barn as given below about five hundred dollars.

If all the room I have arranged for is not required on the farm now, a part only need be erected at first, and the plan be worked upon until the whole is completed. This I consider is one of the best features of the remodelled plan herewith given.

Materials and Cost.

2,500 feet scantling and lumber for inside work;	2,508
feet of 11 feet siding; 153 feet for gables;	2,661
feet of 18 feet flooring; 1,075 feet of rafters, viz.,	
28 of 21 feet long, 16 of 20 feet long, 37 of 19 feet	
long; 162 feet of rafters for cellar—a total of	
11,562 feet at \$14 per 1,000 feet.....	\$161.87
3,250 feet of sheathing @ \$10 per 1,000 feet.....	32.50
2,736 feet of lofting @ \$10 per 1,000 feet.....	27.36
13 windows, 2 by 3 ft., @ 80c.; 2 of 2 by 2 ft., @ 60c..	11.60
1 window, 3 by 3 ft., \$1.25; 500 scantling for braces,	
87.....	8.25
27,500 shingles, @ \$3.50, 18,000 boards, @ \$1.....	169.25
Hinges, nails and battens about.....	50.00
Cellar: mason work and lime, \$60; carpenter, \$200.....	260.00
Total cost.....	\$730.83

Dairying in California.

BY M. E. BAMFORD.

While Eastern dairymen are supplied by nature with green grass all summer, in California the grasses dry and the hills look brown by the middle of June. The general practice of dairymen in the Sacramento and San Joaquin Valleys is to leave their families about May 1, and take all their cows, calves, pigs and poultry, to the higher regions of the Sierra Nevada, six to seven thousand feet above the sea, where, the snow having melted, green feed can be found until September. Some dairymen, however, keep their cows in the Sacramento Valley and feed during the dry summer, in the table lands skirting the river, placing their butter and cheese on the river steamers for the San Francisco markets.—One favorite spot for the migrating dairymen is the country around Lake Tahoe. The little valleys about the lake are dotted in summer with their cabins.—Here may be found the latest inventions for butter-making, such as patent churns, setting pans, and a variety of dairy appliances. By this change of location, green pasturage is lengthened to nine months instead of five in the valleys.

The mountain dairy products are often sent over the line into Nevada, which draws largely upon California for such supplies. Although these mountain ranges are sometimes cropped very closely, the next year the grass is as thick as ever, and dairymen say the pastures are just as good as when the country was first settled. The cows eating these natural grasses average one hundred and fifty to two hundred pounds of butter yearly.

The capital now invested in dairying in California is fifteen million dollars, and the annual products about nine millions, giving employment to some six thousand men.—This industry began about 1849, when the gold fever was at its height. Some men observing how difficult it was for miners to obtain supplies, and how much they would gladly pay for milk or butter to add to their rough fare, established dairies and immediately found themselves in a paying business, more profitable to many than working in the mines, as cows then cost only five dollars apiece and land was cheap.

It is customary in this State for dairymen to rent the cows with the land, about eight acres with each cow. The yearly rent per cow varies from twenty dollars in hilly portions to thirty-two dollars on more productive soil. The tenant pays his rent with a certain number of calves and some hay, the proprietors supplying the necessary buildings.—About seven thousand tons of butter and fifteen hundred tons of cheese are made yearly in this State. [See census figures on page 56.] The largest butter dairy in California is in Humboldt

county, comprising over thirteen thousand acres, and over two thousand one hundred cows. Del Norte, the most northern coast county, also ships large quantities of very good butter to San Francisco—sometimes a hundred tons of butter a year. The price varies in San Francisco from twenty-five cents per pound in April to forty cents in October, this difference of course depending very much on the condition of the indigenous grasses.

Those counties nearest to the Pacific are naturally best suited to dairying, as the constant fogs take the place of rain and keep the grass green from February to September, a much longer period than in other parts of the State. The lower summer temperature also favors dairying in these counties, such as Marin, San Mateo, Humboldt and Del Norte. San Mateo county is the chief source of milk for San Francisco, and day by day, on the country road, may be seen a long string of wagons bound cityward. This county has the largest milk ranch in California, at San Bruno, fourteen miles south of San Francisco. Its two thousand seven hundred acres occupy the entire width of the peninsula from the ocean to the bay. Here five hundred to six hundred cows are milked twice every

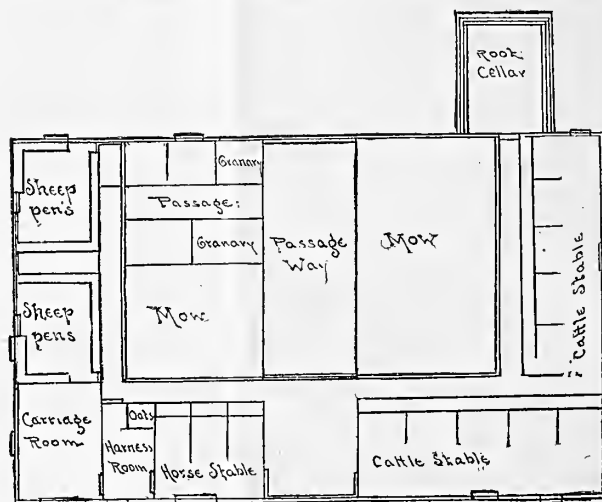

Fig. 3.—GROUND PLAN OF REMODELLED BARN.

day, and the milk put in three gallon cans. Two hundred of these are packed into a huge thorough-braced wagon, and, at noon or at midnight, six mules start with the load, and reach the city in two and a half hours. This dairy supplies about four hundred thousand gallons of milk yearly, most of it being sold in San Francisco. Such large dairies cannot depend on the natural grasses, and two thousand acres of this ranch are devoted to rye and orchard grass. Many raise Alfalfa, or Chilian clover, (Incarn) for their cows. The *Aflerilla* and bur-clover are indigenous plants, which are most useful to dairymen. In some exceptional south-

Fig. 4.—SIDE ELEVATION OF NEW BARN.

ern sections of the State the wild oats occupy large areas, and the cultivated kinds are also grown.

In San Francisco, as well as in eastern cities, cows in the suburbs are fed on exhausted malt from the breweries. While this increases the flow of milk, its unwholesomeness is seen in the short lives of the animals, which in a very few years become unfit for milking and are sold to the butchers.

The cheese counties of California are San Luis Obispo, Monterey, Lake, Mendocino, and Sonoma, (the first named being the largest cheese pro-

ducer on the coast,) these five counties last year making above eight hundred thousand pounds.

The old Spanish cattle, formerly found in such numbers on the plains between San Luis Obispo and San Diego, have almost wholly disappeared. A few mountain ranches have specimens of these long-horned, wild-looking animals, but the great herds of mustang cattle which twenty years ago so covered the plains of Southern California that one could ride for hours, meeting nothing but endless troops of the wild creatures, are gone. In former days that part of the State was divided into leagues instead of miles, and a cattle ranch comprised from nine to thirty-three square miles of land. But these great tracts have been sub-divided and many of them are now in the main used as grain land.

California, however, in common with most of the Pacific States, raises large numbers of neat cattle for beef. Great herds of these roam over the uninhabited portions, the animals of different owners mingling together and are only distinguished by the different brands. At the *rodeo* in the autumn of every year, the herds are separated and the calves marked the same as the cows they follow. These cows are never milked and are not very tame. As these herds live on the natural herbage, their appearance varies very much at different seasons of the year, being fleshy in March and June, and thin in August, and sometimes starving to death before spring grasses appear. One of the largest cattle ranches is on the west bank of the San Joaquin River. It contains seven hundred thousand acres, and is owned by a single firm. This is an exception to most ranches, in that part of it is irrigated so that Alfalfa (Lucern) can be raised to supply the sixty thousand cattle there pastured.

Two Sleds in One.

Mr. Chas. H. Wiley, Martinsville, Me., sends us a rough sketch of his sled, which is durable and cheap, as he has two sleds in one, and uses it for

CHEAP AND DURABLE BOB SLEDS.

oxen or horse. The runners are of one and a half inch plank, ten inches wide; bunks (benches) of four by six inch timber; shoes, chilled iron; raves and other ironing, good wrought iron. He prefers guy chains to a tongue for working in the woods and among stumps, as it clears them better. All fastenings are screw bolts and easy to repair. Length of runners at the bottom is four and a half feet, at the bunks four feet and two inches; runners three and a half feet apart. The entire cost is about thirty dollars, and it will take two tons anywhere.

Home-Made Sausage-Filling Press.

Mr. C. B. Beatty, of Fraser, Mich., sends us a sketch and description of a simple bench and lever arrangement to be used with the common sausage

A SAUSAGE FILLER.

filler which lightens the work so much that even a small boy can use it with ease, and any person can get up the whole apparatus at home with little or no expense. Mr. B. says it is much used by his neighbors, who esteem it very highly. An inch

thick pine board, a foot wide and four and a quarter feet long, is fitted with four legs, two and a half feet long, notched into its edges, with the feet spread outward to give firmness. Two oak standards, eighteen inches high, are set thirty-four inches apart, with a slot down the middle of each for the admission of an oak lever eight feet long. The left upright has three or four holes above each other for the lever pin, as shown in the engraving. The tin filler is set into the bench nearer the left upright, and projects below for receiving the skins. Above the filler is a follower fitting closely into it and its top working very loosely in the lever to allow full play as it moves up and down. The engraving shows the parts and mode of working.

Manual Arts in Farming.

So far as farming is of the nature of a trade, its successful pursuit requires skill in certain fundamental arts. It is true that the extensive use of machinery has rendered some arts formerly important, of comparatively little consequence, as, for example, the art of reaping grain with the sickle, the kindred arts of using the grass scythe and grain cradle. The combined reaper and mower, driven by horse power, has superseded both. Apparently the time is near at hand when the self-binding harvester will entirely dispense with the art of binding grain by hand. But this steady change from hard labor to machinery merely changes the kind of skill needed. Indeed, the skill now required to run machinery successfully is of a higher kind and more difficult to acquire than that of the manual arts superseded. To use the sickle or scythe requires little more than patient repetition, and blind following of example. To manage a self-raking reaper or a self-binding harvester needs not less patience and care, but also higher mental qualities, a certain steady thoughtful observation, good judgment, and a development of what may be called the mechanical sense, a something which enables a person to keep in his memory all the parts of a machine and their adjustments, and allow none to get or remain out of order. There is greater need here for that cultivated intelligence which a good education alone gives. The modern farmer's son who has had a few month's study of mechanics and mechanical movements, is much better prepared for his work than one without this limited amount of training. The essential principles of mechanics which underlie the knowledge of the proper use and adjustment of machinery, may be learned by any ordinary boy much easier than circulating decimals or the arbitration of exchange; and when they are learned, they will be a thousand times more useful to him.

But aside from the more complicated kinds of farm machinery, there are a good many simple arts, useful to know and not specially difficult to learn, yet often poorly mastered. Among these may be mentioned hitching up and driving a team in the best way, adjusting and holding a plow, building hay and grain stacks, milking a cow, dropping seed with a horse planter, cultivating corn, grinding a mower knife, marking out a straight furrow, shearing a sheep, husking corn, and many other things. The difference between great skill in these arts may be well illustrated by the case of two men, both strong and willing, whom the writer once employed to husk corn. One would husk and crib sixty bushels (of seventy pounds each) every day; the other seldom did half as much. The first in a trial effort, in ten hours of one day, husked one hundred and twenty bushels; the other could not husk fifty to save his life.

Might not greater interest in rural life be imparted to our boys by well-directed efforts to cultivate the highest development of skill in these useful arts? Suppose a county fair to select a half-dozen of them and offer a series of prizes to those young men or boys who should excel, in all or some of them. Is it not possible that such a course would be more useful to the community than the fast trotting which now is usually the only form of activity in which the management of our fairs take much interest. Let intelligent friends of rural im-

provement try some plan to furnish a substitute for the demoralization so closely connected with horse racing at the fairs. The kind of competition suggested would provide an interesting series of entertainments at these gatherings, and also stimulate effort in the way of learning useful arts.

A Simple Automatic Wagon Brake.

Horses or oxen, as well as men, can put forth tremendous efforts for a brief period, but when prolonged, as in drawing a heavy load up a long hill without resting at short intervals, the strain is unnatural, and horses are frequently wind-broken in this way. Very few farm wagons are provided with brakes, and these need close watching and the attention of the driver, who may often mistake the approach of exhaustion in the team. I send herewith a home-made simple contrivance (fig. 1) that acts automatically, stopping the descent of the vehicle whenever the team stops pulling, without any act of the driver. I made mine from a broken

Fig. 1.—A WAGON BRAKE.

handle of a pick hand-spike, sawing off the handle four feet from the pick. The blacksmith made two bolts of three-quarter inch iron linked together (fig 2), one provided with nut and screw to go through the hind bolster of the wagon, and the other sharpened a little to go into the end of the stock. By attaching this near one end of the bolster, when not needed it can be swung up between the box and wheel so as not to interfere with a team following, or be needlessly worn at the lower end. When dragging on the ground it of course stops any backward motion. For convenience a small rope may extend from near its lower end to the driver, who can then lift it at pleasure without leaving his seat, as when for example he may wish to back the wagon. A shorter piece may be at-

Fig. 2.—THE CONNECTING LINK.

tached to a sleigh in a similar manner. A straight bar of iron of proper length, without any wood, would answer, and be but little expense at present prices of that metal. For ordinary loads a five-eighth or three-quarter inch bar, a little hard tempered, would be stiff enough. A three-quarter inch iron rod four feet long weighs about twenty-one pounds.—Unless the bolster be strongly bolted on it might be started by a sudden heavy pressure. The brake might be attached to the axle, if the bolster is not firm enough. W. D. BOYNTON.

THE ICE CROP.—One of the leading crops of the country is housed during the winter season. The people of the city sadly feel the effects of a poor ice harvest. The farmer should lay in a year's supply of ice at the earliest opportunity. It costs but little to harvest, saves summer foods, and adds very greatly to the comfort of the household.

Poultry-Yard Convenience.

Figure 1 represents a combined portable coop and yard for setting hens, and when they are with the young chicks. The part *a*, is enclosed with half-inch boards, with a hinged cover, *m*, and a movable slide, *c*, opening into the little yard.

Fig. 1.—A POULTRY COOP AND YARD.

Another sliding door, *d*, is for entering to the yard from the outside. Chickens, eggs, and hen can then be handled through the cover. The dimensions are two-and-a-half by six feet; height eighteen inches. The resting-place space occupies one-third, leaving four by two-and-a-half feet for a yard. A tight floor keeps the moisture from the nest and brood. After the chickens go into shelter for the night, the sliding door, *c*, should be pushed down. This movable coop allows a frequent change of pasture for the chicks. The strips to which the laths are nailed, are four inches wide. The two at the top have a continuation at each end of eight inches, to serve as handles for moving the coop.

Figure 2 represents a covered feeding table, which allows the chickens to eat at any time under shelter, but prevents them from wasting any of the food. The trough is one foot wide, and four feet long. The table *a* is eighteen inches wide, and four-and-a-half feet long. The roof, *p*, is two-and-a-half feet wide at the base and five long, which gives protection enough to shelter the chickens while eating. The trough, *t*, is open at the bottom, *o*, allowing the grain to work through upon the table below, keeping up a supply as long as any remains. A narrow strip, *s*, nailed along the edge of the table, keeps the chickens from working the grain out upon the ground. The table stands upon four legs (not shown), which also support the trough and roof. The roof can be lifted off for filling the trough with grain.

Fig. 2.—FEED BOX.

Sowing Spring Wheat.

PROF. S. R. THOMPSON.

In the spring wheat regions of the West and Northwest, sowing will begin in the latter part of this month, or early in the next. Old settlers know the advantages of sowing spring-wheat as early as possible. New comers who are not too knowing to heed the results of experience, will get in their seed as soon as the frost is out sufficiently to allow it. Where the ground was fall-plowed for wheat, as should always be done, the seeding may almost always begin by the first week in March. In western Nebraska wheat is frequently sown by the middle of February; in the eastern part of the State a little later. When the ground is dry and mellow, as it usually is, wheat may well be covered deeper than in the East, and deeper on newly broken than on old land. The best crops of wheat the writer ever grew, were the first crops on new land, broken deeply, and stirred still deeper the

season before. The seed was covered with a four-shovel corn plow, to an average depth of three inches. In one case a part of the field was seeded in this way, and another sown broad-east by hand and harrowed in; the former yielded twenty-eight, and the latter twenty-three bushels per acre. On moist land, or that broken many years before, or quite moist, shallower seeding does best. The deeper seeding suffers less from hard frosts, always to be expected after spring wheat is in. In certain seasons wheat seems to do better when drilled in, which is always better to secure uniform depth; but on old land the spaces between the rows furnish such a favorable place for weeds to grow, that on the whole, broad-east sowing seems to be the most satisfactory, when the seed can be covered deep enough. It may be suggested to new comers that usually wheat is grown profitably only on new land. On that under cultivation four or five years, some other crop is more likely to pay. This is for the latitude of Nebraska. In Dakota it may be different; time will tell. It is always dangerous, sometimes ruinous, to confine farming to a single crop, and particularly so with wheat. The outlay for seed, harvesting and threshing, is so great that a poor crop results not merely in loss of time and labor, or of prospective profits, but of capital invested. And finally, on this and kindred questions, farmers new to the West are advised to listen to the opinions, and profit by the experience of those who have been longer on the ground. Those who are too knowing or too conceited to do this, may have occasion to recall the saying of wise old Ben. Franklin: "If you will not hear experience, she will rap your knuckles."

Fish and Fruit in Florida.

BY ROBERT BARNWELL ROOSEVELT.

At Jacksonville we felt almost as much at home as if we were in New York. We found friends there, we made others, and enjoyed ourselves so thoroughly that it was only the imperative demands of sport that compelled us to move on. Near so large a city there is naturally not much to shoot or to catch. There are innumerable ten-pound cat-fish which our companion, Seth Green, the fish culturist, was never tired of taking. He insisted they were excellent eating, a matter in which we allowed him to have his opinion without contesting the question. The water on the surface is fresh, and some black-bass can always be caught in the vicinity. The condition of the water in the St. John's is different from that of any other stream with which I am familiar. Even up to Pilatka, seventy-five miles above, the surface water is absolutely fresh, while near the bottom there is a current so salt that crabs are caught in the shad nets. The saltier fluid seems to be denser and heavier than the other, and will not mingle with it, so that we have the anomaly of both fresh and salt-water fish being caught at the same time and place.

Into the St. John's there empty at every few miles tributary streams that are rarely ascended by the visiting sportsman, and where the birds and fish exist in their primeval abundance and fearlessness. It is unnecessary to specify these by name, or to particularize any as better than others, for they are essentially alike. We could not explore them all, but those which we did, we found filled with fish and with a fair amount of game. It was too early in the year for alligators, if they can be called game, to show themselves, but birds were to be had plentifully, and fish were simply innumerable. Of these we killed so many that we had to salt them down. There is an additional interest, the interest of new explorations, in ascending the secluded rivers, and I advise every tourist who visits this portion of Florida in his own conveyance, not to omit going up one or more of them.

This was a late season, shad were running, and we had them continually on our table, but roses were not in full bloom in the open air, and as for strawberries, which are usually abundant by New Year's, they had not come in at all yet. We had

bought up all the curiosities that we could distribute among our Northern friends; we had played with the baby alligators in the jewelry stores; we had listened to the first installment of the wonderful Florida stories; we had dined at all the excellent Jacksonville hotels, and were ready to withdraw once more from civilization. So the Heartsease spread her sails again, and started up the river. I say "up," because by the current our course was up stream; but it was down by the map. We were going south, the St. John's being one of the few of the North American rivers which seem to run the wrong way, that is, from the south to the north. In our short stay in Jacksonville we had learned that alligator-tooth jewelry is occasionally made of celluloid; that one of the best drinks in the world of bar-keeping is a punch compounded from the native sour orange; that Florida stories are always reliable, even when they assert that mosquitoes are so abundant that hogs make meals of them, or inform us that the favorite game fish of Florida, the tarpon, jumps six feet out of water when he is hooked, or that sharks will seize a man if they have to leap as high as the deck of the yacht to do so. In leaving Jacksonville, we supposed we were leaving all this behind us, not knowing that Florida is full of quaint jewelry made, as the jewelry of no other part of the world, out of fish scales, saurian teeth, sea beans, shells, orange tree woods, and sharks' molars; that everywhere there are wonderful stories which only differ from one another in size; that palmetto hats were to be bought in every village store, and that sour oranges hang from innumerable trees, valueless for traffic, and only begging to be made into neetar fit for gods.

By the time the Doctor had made these philosophical reflections, Heartsease was tearing along before a favoring breeze past Mandarin, past the Magnolia Hotel and Green Cove Spring; past Toco, the terminus of the St. Augustine Railroad, till she made anchorage by nightfall off Pilatka. On the way we had put up many ducks, and seen the cows up to their backs in water feeding off the cabbage at the bottom, and thrusting their heads clear under to get it, and we began to realize that in the end we might come to believe anything of the wonders of this wonderful land. On the last day of our stay in Jacksonville, we had given a little lunch on board, and to show what dinners can be got up there, and how easily, I will reproduce the bill of fare. Everything had been prepared on board, and although our cabin could only seat twelve, we placed before the guests cold turkey, beef and tongue, chicken salad prepared by the Doctor in most artistic style, stewed oysters, roast potatoes, radishes, and for dessert banana salad—an invention of the better part of the party,—Dummit Grove oranges, sapidillas, and grape fruit, with *pieces montées* of palmetto leaves and sour oranges *en branches*. There was a little *paté de foies gras* also, but that need not be counted, because it came from the North.

We found that when we had reached Pilatka the stories, instead of diminishing, developed yet more astonishing proportions. The mosquitoes, that the hogs fed on at Jacksonville, put out the head light of the locomotive at Pilatka, extinguished a bonfire, and made nothing of the negroes' "light wood torches"; the tarpon of Jacksonville could only jump six feet high when hooked, while the tarpon of Pilatka, without being hooked, bounded clear over the rail of the steamboat Seth Low, which was ten feet from the water, struck the captain in the stomach and knocked him down. We had not been at Pilatka two days, before we were ready to swallow any mental hallucination, so rapidly does faith grow in the glorious and balmy air of Florida.

If Jacksonville had been attractive, Pilatka was equally so. Opposite to it is the famous orange grove of Mr. Hart, which we had to visit, and where we ate our first oranges plucked by ourselves from the trees, besides tasting mandarins and tangerines, lemons, limes, guavas and bananas, and that best of all oranges, the grape fruit. There were great plantations of bananas, which grow by suckers from the roots, and increase like weeds. They have

to be three years old before they bear, and the development of the flower and fruit, which was going on while we were there, was a pretty sight. The top of the stalk turns over and produces a huge purple flower of a single leaf, as large as the hand of a giant. From under this large leaf starts a circle of small sprouts like fingers. The big leaf falls off, but from the ends of the fingers burst other much smaller purple flowers. Then below the row of fingers grows another large flower like the first; it also uncovers another row of fingers, and so on till the entire bunch of bananas, as we know it in the market, is formed. Even then the flower point does not cease growing, but exhibits flower after flower, which are merely ornamental and do not result in fruit. Sprouts start so freely from the roots, that the young bushes have to be cut away every year with scythes, or they would become crowded and the fruit degenerate. Every day that was spent studying the wonderful productions of Florida, every new tree or bush which attracted our attention by its beauty or its oddity, every new species of fruit which charmed our palate with its originality of flavor, made us more in love with this interesting country, and wish that it and its accompaniments could only exist in a colder climate. There was but one feeling in the minds of the party on leaving Mr. Hart's plantation, which was a wish that each of us could own an orange grove, and have it close at home.

The stories concerning the dangerous nature of the snakes of Florida are probably exaggerated, as we saw no more of them than we would have seen in the same amount of country life at the North. The negro children bathe off the docks at Pilatka and Jacksonville as a common thing, and later in the year, when the peril from the snakes is greater. There are spots where, as I have said, they are to be dreaded, and we heard well authenticated stories of men being snake bitten; but on the other hand old hunters, who were in the woods most of their time, told us they were never troubled by their attacks, and the camping out parties, which we encountered all over, seemed not disturbed by them. Still, while on the subject, I will give the prescription which was kindly furnished us by Dr. Kenworthy of Jacksonville, and which will doubtless prove a better cure than the common one of getting drunk on whiskey: mix two tablespoonfuls of the carbonate of ammonia with enough spirits of camphor to make a paste. Apply this on a rag to the bite, changing the rag as often as it gets discolored. Our medical associate gave his approval to the remedy, and if those two authorities could not cure a snake bite, no one can.

In spite of the beauty of the country, there is a sense of desolation about the wilder parts of Florida. The great trees covered with moss, and many of them going to decay; the dull, sluggish rivers with slow discolored current; the low lands never rising above a shell-mound of twenty feet high, combine to produce a feeling of dreary solitude. This was particularly noticeable on the journey to Southern Florida, through the endless swamps, marshes, and reedy islands which border the narrow inland streams, and was only occasionally broken by passing a town, or one of the few country seats that are to be found on the unhealthy shores. Nor do there seem to be many water fowl on the Southern Atlantic Coast, until you pass to the south of St. Augustine and reach the neighborhood of Indian River. In making the trip up and from the St. John's, we only saw, besides the ducks and English snipe, the bay-birds of which I have spoken, and a number of the handsome and imposing white herons. These stood in solemn grandeur on the shore of some creek, and seemed too glorious to shoot. Occasionally, however, we could not resist, and had to murder them for their loveliness. Then one of us would hide himself among the reeds on the shore, while the other would go to the extreme end of the line of stately creatures, and put them up. They fly slowly along the edge of the water, and if the sportsman is well hid, there is no difficulty in getting a shot at them. They should never be killed unless it is to set them up and preserve them in a cabinet.

A Nest Box for Sitting Hens.

The nest box shown in the engraving, can be made to contain as many nests as desired, and be placed in the poultry house or any other convenient place. When a hen is set in one of the nests, the end of the lever is slid from under the catch on top of the box, and the door falls over the entrance to keep out other hens. They rarely molest the sitting hen after she has held exclusive possession three or four days, and the drop may be raised

BOX OF HENS' NESTS.

again. The box legs should not be over six inches long. The step in front of the nests, four to six inches wide, is a continuation of the bottom of the box. It is a vast improvement on old barrels, broken boxes, and other hens' nests generally used.

Prepare for Early Vegetables.

Very few farmers care to give the attention needed by a hot-bed, and trust to sowing the seeds of vegetables in the open ground. As a consequence, farmers rarely have early vegetables in their gardens. There is a method by which vegetables may be enjoyed from one to two months earlier than by sowing the seeds in the garden, and costs very little trouble. This is to raise the plants in the windows of the kitchen or other room. Our old-time readers understand this method, and we regard it of so much importance that we bring it especially to the attention of our many new subscribers. Plants sufficient for the family garden can be raised, usually of better quality than in a hot-bed as generally managed, and they will interest the young people who always like to see things grow. Boxes for the purpose are made of half-inch stuff well nailed together. Their length should be suited to the width of the window, a foot wide, and the depth of three or four inches. In modern houses window sills are rarely wide enough to hold such a box, and it is well to suspend it by means of a wire at each end. Drive in a screw near the upper edge of the end of the box, and near the side the farthest from the window, and a corresponding screw in the window casing. A piece of copper wire twisted around the screw in the box, and its other end made fast to that in the casing, will hold the box securely. Those who regularly use such boxes, provide the soil for them the autumn before. The lack of such provision need not deter any from trying to raise plants in this manner. Earth from the woods is a most excellent material for filling the boxes. This collects in the hollow places, and can usually be gathered in a mild time, even in winter. If woods-earth is not to be had, take advantage of a thaw, and scraping up some garden soil, place it in a heap in the cellar until it is dry enough to use. If at all heavy, it may be made porous by adding sand, or, what is better, fine moss. Procure some sphagnum or peat-moss, such as nurserymen use for packing; dry it thoroughly, and rub it through a coarse wire sieve. One part of this fine sifted moss to four or five of soil, makes an excellent material for seed boxes, as it will not become packed by the needed waterings. As a rule, the seeds should be sown in them about six weeks before the plants can be safely set out in the open ground. When the seedlings are large enough to handle, usually when they have made two rough leaves—those after the seed leaves—they will need transplanting into another box of similar soil, setting them an inch apart each way. Plants in the boxes must have water as they need it, and on warm days they may

be set outside in a sunny sheltered place, bringing them in before the air becomes chilly. The vegetables usually started in window boxes are early cabbages, cauliflower, lettuce, and tomatoes; in April, egg-plants and peppers may be thus sown.

A Sheep Rack.

W. E. Jones, Smithfield, Pa., sends us a sketch of a sheep rack, the dimensions of which are: length twelve feet, width two feet nine inches, and height three feet. The materials are: ten boards twelve feet long, eight of them ten inches wide, one seven inches wide, and one eight inches wide; four boards two feet nine inches long and twelve inches wide; six posts three by four inches, three feet long; sixty-four slats, sixteen inches long and one inch square; and two strips twelve feet long, and two-and-a-half inches wide. Nail the two narrower boards in the shape of a trough, turn it bottom up and draw a line through the middle of each side. Set the dividers to four and a half inches, and mark along the lines for holes with a three-quarter-inch bit, and bore the narrow strips to match. Set the slats into the trough, and fasten the strips on their upper ends. Nail two of the boards

FODDER RACK FOR SHEEP.

to the posts on each side, as seen in the sketch, and also the short boards on the ends. Lay in a floor one foot from the ground, and set in the trough as shown in the above engraving. Fit a board from the slats up to the top of the outside of the frame. The floor need not cover the middle under the trough.

A Cheap Manure Shed.

Many waste much of the value of stable manure by throwing it out of doors to be acted upon by sun and rain. We recently saw a very cheap, sensible method of almost wholly preventing such loss. A board roof, ten feet square, is supported by posts eight feet long above ground, which are connected inside by a wall of planks (or of poles, as the one examined was). Near the post at each end stakes *a, a*, are set, against which one end of the

A SHED FOR MANURE.

end planks rest. This allows the front planks, *d, d*, to be removed in filling or loading. It is placed near the stable, preferably so that the manure from the stable can be thrown directly into one corner, whence it is forked to the opposite corner in a few days, to prevent too violent fermentation. A frequent addition of sods, leaves, and other materials that will decompose, will increase the heap, and improve its value, supplying a manure superior to many of the commercial fertilizers, at less cost.

Bees in Winter Quarters—Dysentery.

BY W. Z. HUTCHINSON.

Bees sometimes die of starvation; it is possible that weak colonies, left unprotected on summer stands, have frozen to death; while it is also possible, though rather doubtful, that they have been smothered during the winter; but the greatest obstacle to successful wintering is the so-called "dysentery" or "bee-cholera." All other losses combined are but as a drop in the bucket compared with those caused by this malady.—To sustain life and keep up the animal heat during the long cold winter, bees necessarily consume food, and in time the intestinal canal becomes filled with fecal matter which bees are disinclined to void in the hive. They wait day after day for a rise in temperature that will enable them to fly in the open air and relieve their over-loaded intestines. If confined too long their abdomens become fearfully swollen, and no longer able to retain their faeces. These are voided in the hive, thus daubing bees, combs, honey and frames; and the loathsome, sickening manner in which the unfortunate bees miserably perish can be more easily imagined than described. Such, in brief, is "dysentery" or "bee-cholera."

A warm day, with the mercury up to fifty or sixty degrees, enables bees to enjoy a "purifying flight," and the surviving members of a colony, not having suffered too severely from dysentery, will then sometimes set bravely to work and clean up their soiled plumage, and, if circumstances continue favorable, such colonies often "pull through," but are more likely to "spring dwindle," which is usually the result of imperfect wintering. The long retention of faeces so impairs a bee's vitality that, though it may live until spring, it has not sufficient strength to withstand the chilling winds encountered in its first flight.—Many plans and methods have been devised to prevent or mitigate this dysentery. One man, attributing it to cold, builds a cellar or special winter repository. All goes well for several years, but at last, on some fine spring morning, he carries from his cellar hive after hive containing only dead bees and mouldy, ill-smelling, discolored combs, while his neighbor's bees on the unprotected stands suffer no loss; and thus the "cold theory" falls to the ground. If it happens that his neighbor's hives were well ventilated, he at once adopts the "ventilation theory," and thereafter his hives are thoroughly ventilated. Again, all goes well until there comes a winter when his neighbor's bees die and his own live, and down goes the "ventilation theory."—Others have considered dampness the chief foe to successful wintering, and, acting upon this belief, they have constructed cellars in which dryness is chiefly kept in view, some even going so far as to place a bag of unslaked lime over each colony. In some seasons and localities bees have wintered admirably where the "humidity theory" was believed in and acted upon; but in other seasons and localities they have miserably perished. Chaff hives, chaff packing, etc., and various devices have been employed, and when the bees wintered well these devices have received the credit, and when they died, it is attributed to many and various causes.

Cold alone does not produce dysentery, as bees wholly unprotected in exposed situations have passed severe winters in perfect health, while others in the same situations have died before the winter was half gone. Confinement alone does not produce dysentery, as bees have been kept in cellars or special repositories five to six months without a trace of it, yet in another season they have died within three months after being placed

in the same cellars. Want of ventilation does not produce dysentery, as bees have been kept in perfect health buried in "clamps," where the only air reaching them during five long months was what passed through two feet of earth covering. But then again, clamps have been opened in spring only to find every colony dead from dysentery. Dampness alone is not the cause, as bees have been successfully wintered in cellars where there were running springs, and also where the owner, believing dampness beneficial, has shovelled in bushels and bushels of snow; also in an out-door cellar covered with straw through which the snow, melted by the heat arising from the bees, has continually dripped; yet in similar damp situations bees have died from dysentery.

It has been intimated that, if bees were kept in an atmosphere sufficiently dry and warm they would void their faeces in a dry state and remain healthy, but the fact that bees have suffered terribly from dysentery in the driest and warmest of cellars, makes a "big hole" in the "dry faeces theory." Some have placed great stress upon the importance of not disturbing bees while in their winter quarters, while other equally successful apiarists open the hives and examine the bees once a week or so throughout the entire winter.

These statements may appear, and doubtless are, discouraging to bee culture; but they are facts, and why ignore them? This apparently conflicting character is what puzzles the novice, and it is only upon one hypothesis that they can be explained, viz.: that the primary cause of dysentery is in the food. Honey is not a chemically pure sweet, but contains more or less vegetable matter, as floating grains of pollen, etc. The proportion of vegetable matter differs with the season, the locality, or the source from which it is gathered. Honey (?) gathered from the juices of cracked or decayed fruits, from the cider mills, or from honey dew (the secretions of plant lice), is certainly not a pure sweet. The more vegetable matter present in honey eaten, the sooner will the intestinal canal become filled with fecal matter, and the shorter the time that confinement can be borne. Cold may aggravate the trouble, as it increases the consumption of food necessary to keep up animal heat, and thus sooner overloads the intestines, hence all protection against cold is beneficial in so far as it lessens the amount of food required. A cellar affords the best protection against cold, yet it is not always the best place for wintering bees. Thus for example, if in any season the honey contains much vegetable matter, and the combs are well filled with pollen and an open winter follows, affording bees kept in the open air many opportunities for "purifying flights," spring finds them in a healthy condition; while those in the cellar, though eating less honey, have had no opportunity to fly and discharge their faeces and have suffered severely. Had the winter been severe and the cold long continued, with no warm "spells," the bees in-doors would have suffered just the same, while those in the open air would have been almost entirely swept away. If the honey of any season is very pure, and the following winter warm, out-door colonies will be entirely free from dysentery, and those in cellars will suffer but little if any. If the winter be cold the health of cellar colonies will remain the same, while those hives left exposed out-of-doors will probably suffer to a slight extent.

With most diseases the best remedy is to remove the cause, and bee-cholera is not an exception. Unfortunately, however, there is no way of controlling the character of the honey gathered, and no cheap, practical method of determining its fitness for winter stores after it has been gathered. The only plan left is to remove the honey at the end of the honey harvest, and replace it with that of assured fitness for winter food. Such a food is pure cane sugar. As a heat producer it is vastly superior to honey, hence a less quantity is consumed, while the residue left after digestion is very slight. Time and again has it been proved that this is an almost certain preventive of dysentery, and probably the main reason for its not having been more universally adopted is the trouble of

extracting the honey at a time when robber bees are very annoying, and of preparing and feeding the sugar. To this may be added, perhaps, the belief that "the coming winter will be a good one for bees." Then, too, if a bee-keeper does feed sugar to a few colonies, and all his bees chance to winter alike, he at once concludes sugar is no better than honey, and the experiment is not repeated. But could he see, as the writer has, sugar-fed colonies carried from the cellar in spring, in fine condition, dry, healthy, bright and clean, the bottom boards showing scarcely a handful of dead bees; while colonies with natural stores, standing by their side, were dead and "rotten" with dysentery; or could he see every out-door colony swept away except those having sugar stores; could he open a "stand" in spring and find the colonies with sugar stores alive, strong, and healthy, while all the others had suffered, and some had died, from dysentery—could he see all this he might believe that "vegetable matter" was the cause of the disease.

To prepare the sugar for feeding, make a syrup by adding one quart boiling water to four pounds of pure granulated sugar—confectioner's "A." Purity is important. If practicable get a candy manufacturer's assistance in buying a pure article.—But though feeding sugar prevents dysentery, it is advisable to protect bees, either by packing them in chaff on their summer stands, or carrying them into cellars, or burying them in "clamps." The decreased consumption of food by the bees will alone pay for the trouble that is thus occasioned.

A Second Story Wagon Box.

Mr. L. D. Snook sends a sketch of a simple method of keeping an extra wagon or sleigh box in position, which we used at least forty-two years ago.

in marketing apples. Still, as it may not be familiar even now to some readers, we present the engraving. The top, or extra box, is made of exactly the same dimensions as the lower one and of any desired height. Strong cleats are firmly nailed on the inside at each corner, on the sides of the upper box, extending down well into the lower one, and so closely to the end boards that it can slide neither forward nor backward. One or more side cleats are put on according to the strength of the upper boards and the pressure likely to come upon them from the character of the load in the box.

Dangerous Ladders.

If left exposed to weather, as they usually are, no one knows how soon water will penetrate at some point, as in the holes for the rounds, and produce decay and weakness, where all looks sound, and a broken limb or neck may be the result. Mr. John Wagner, of Grant Co., Wis., advises to drive

two pins in the side of a stable near the ceiling, and hang the ladder there whenever not in use. He says they "have one made of poplar, a perishable wood, which has been thus kept for five years and is to-day as sound as new."—Very good, but better still to put the pins on the side of a barn floor, when there is a place for the ladder there, as the stable is usually damp. The pins, wherever placed, need to have the outer ends elevated to keep the ladder from jarring or slipping off. We have seen the pins made from one end of a forked limb, one fork forming the hook to hold the side of the ladder, as shown in the above engraving.

THE NOTED HEAD OF A NOTED FLOCK.

Drawn (by J. A. S. Monks) and Engraved for the American Agriculturist.

American Merino Sheep.

When the first prizes for Merino sheep were awarded to American Merinos at the International Exposition at Hamburg, about twenty years ago, all Europe was astonished. The Yankee sheep took the prizes over the best flocks of Europe, and they could not understand it. After the first surprise was over, the European sheep-growers, at the close of the exhibition, did the best possible thing—they purchased the American Merinos, or “Vermont Merinos,” as they were generally called, for the improvement of their own flocks, at what was then an unusual price.—The American Merinos are the result of several importations, made early in the present century from Spain, and included animals from the Paular, Infantado, Negretti, and other celebrated flocks, regarded as the finest in Spain. Of these early importations, some were lost sight of, or “run out,” through careless breeding. Others were bred with great care, and by crossing with other pure flocks, under our climate and with no doubt better feeding, they gradually developed, perhaps unintentionally on the part of the breeders, into a distinct family of Merinos now known as American. The superiority of the American over the best European families of Merinos is shown, in the first place, in its greater size and weight. While the rams of the most noted of the Spanish flocks range from sixty to one hundred pounds—this last a weight rarely reached—the American Merino rams run to one hundred and twenty pounds, and upwards to one hundred and eighty pounds. These large weights are accompanied by shorter neck and legs, an in-

creased width of loin and, what is most important, a great increase in the weight of fleece. Some flocks have averaged ten pounds of washed wool, and individual rams have greatly exceeded this weight. The American Merino is marked by strong folds and wrinkles, and some flocks have been bred with a view to these. It is a common impression that excessive wrinkles indicate purity of breed and fineness of wool, and breeders have endeavored to meet the prevailing taste for heavily wrinkled sheep. Those who look to the best returns in wool do not approve of excessive wrinkles, as they increase the difficulty and the cost of shearing. Breeders differ as to the amount of yolk desirable in the wool, and this is sometimes excessive. Fashion has much to do with both yolk and wrinkles; the present tendency is to reduce the amount of both. The American have been found to be superior to any of the European Merinos for improving the flocks of Australia. A few months ago an Australian flock-master who called upon us, said that the sole object of his visit to this country was to purchase American Merino rams. He attributed the great improvement which has lately been manifested in Australian sheep, to the introduction of American Merinos. We notice that English Agricultural writers speak of the improvement in Australian sheep by the introduction of Merino rams, but they fail to state that it is due to the American rams. In sheep-raising, as in many other branches of agriculture, Australians and New Zealanders look to America for aid and improvement, rather than to the mother country. The above engraving represents one of the best of American Merino rams, the sire of a noble stock,

of which hundreds have been sold at large prices to sheep breeders, who desire to improve their flocks in our own country and in foreign countries.

Home Made Half Bushel Measure.

Mr. “C. M. R.,” Albia, Iowa, writes us as follows: I was often in want of a half-bushel measure, until finally I took a soap-box brought home from the grocers. I carefully knocked the sides and bottom loose from one end, and moved this end in to make the box about eleven by twelve inches. Then borrowing a standard half bushel measure, I filled the box with oats, level full, and marked around the inside, and shaved the box down to this mark. I put a strip one inch and a half wide across each end outside to serve as handles, and strengthened the corners with hoop iron well nailed on. This makes a good, serviceable measure, is easily and quickly made, will last for years, and costs nothing. [Oats are not good material to measure with, as they pack more or less according to mode of filling, etc. Sand or wheat would be better. But it is easy and more accurate to work by measure. The length, breadth, and height inside, multiplied together should equal one-half of 2,150 2-5, which is the number of cubic inches in a standard bushel. If you have the width and height, for example, multiply them together, and with double the product divide 2150 and the result will be the length required. Thus, a box ten by ten inches needs to be ten and three quarter inches high to hold half a bushel— $3150 \div 10 \times 10 \times 2 = 10.75$. Eds.]

A Progressing Dakota Farm House.

Mr. E. F. Brewer's plans, herewith given, or something similar in idea, will meet the necessities of a multitude of new settlers, not only in Dakota but in every other State or Territory. As will be seen, it provides for a small house costing a hundred dollars or so, to afford a temporary abode while waiting for a first or second crop, but so erected that it can receive successive additions that will make use of the first structure, or previous additions, without loss or essential change. Mr. Brewer calls it a "progressive" farm house, but we adopt the term "progressing," implying that it is going on, making progress from time to time. The following are his descriptions sent us of the house, with a few modifications and suggestions:

Original House, Figure 1.—This is a building eighteen by fourteen feet, with eight feet

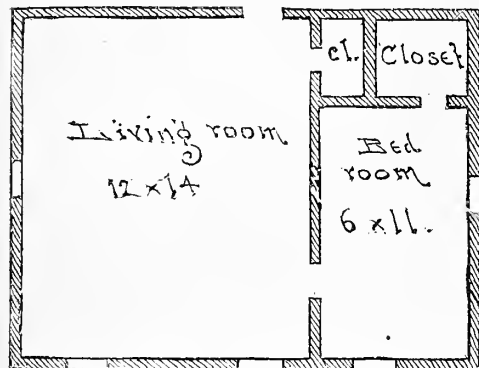

Fig. 1.—GROUND PLAN OF FIRST HOUSE.

corner posts, a "balloon" frame sheathed with rough boards, covered both on sides and roof with tarred or roofing paper. The whole cost would be from eighty to one hundred and twenty dollars, according to the local prices of building materials. The roofing paper should have a three-inch lap, and be fastened with cleats or lath, put down so firmly, that rain will not enter the seams or nail-holes. **First Addition,** Figure 2.—This is eighteen by eight feet, with corner posts six feet six inches, which we may suppose to be added the second year, or after a crop is harvested. This part is covered on three sides like the first, and then the whole covered with ship-lap or other siding. The cost of addition, and siding for both, will ordinarily be about one hundred dollars. If the tarred paper is properly put on, there will be no need of shing-

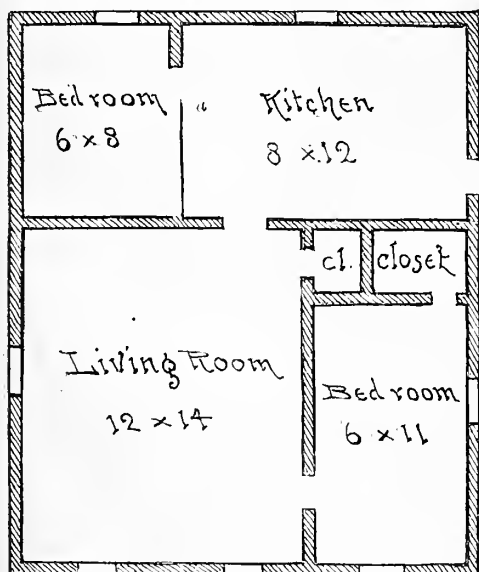

Fig. 2.—WITH FIRST ADDITION.

ling the roof. A temporary board partition is at *a*, to separate a bedroom six by eight feet. There can be a cheap board and cleat door to this, or a simple hanging curtain of chintz or calico, as it is to be removed at the next addition. We give copies of Mr. Brewer's sketches, but suggest that the outside windows and doors in the living-room and in the

first addition, be so cut at first as to need no change of place in the final structure, as shown in figure 3. We have seen families on elevated bleak prairies in Dakota, who had passed one, two, and three winters in single-roomed dwellings, constructed of plank spiked to a sill and plate, set four to six inches apart, and roof boards with wider cracks between—the whole covered with thick roofing paper, laid on lapping a little, like shingles, and held in place by narrow strips at the joinings. A load of lumber, a large roll of paper, and two days' work would suffice for the whole structure. Banking outside with prairie sods, a cooking stove with pipe passing out through an earthen collar, made tight with hard mortar, and a few planks or boards for part or the whole of the floor, complete the outfit. A half dug-out sod structure protected team and cows.—**Second Addition,** or complete house, is shown in figure 3; figure 4 is the Chamber Plan, and figure 5 the Elevation. This is to be done as soon as circumstances admit, in the third year or later. The size is sixteen by twenty-eight feet; height of ceilings in first story, eight feet; in second

story, the side walls are five feet four inches, with the ceilings following up the slope of the roof, until a height of eight feet is reached. There should be a cellar under the whole of the upright, with entrance from the store room, which has an outside door for bringing in milk and other things to be kept in the cellar: figure 3 shows the room arrangement. The temporary partition (*a*, figure 2), is removed; and a permanent partition put up to form an entry four by eight feet on the right end. A veranda is provided in front of the original structure, with entrances to the dining-room and parlor. The front windows to the dining-room should be large, and the upper half of the front door glazed, and possibly that of the door to the kitchen, or this room will not be lighted enough for reading and sewing, especially as it is shaded in part by the veranda roof and the projecting main building. In all structures, the eyes, and plenty of health-giving sun-light should always be cared for.

The **Chamber** plan, and the ascent to it, are shown in figure 4. It will be noticed that the central chamber, nine by ten feet, stands partly out over the front veranda. The reader will notice that the lower part of figure 4 corresponds to the left side of figure 3. **Elevation,** figure 5. The style and outside finish may be as here shown, or any other that may suit the owner. The third year, or when putting up the main part, the entire roof should be shingled, and the inside walls lathed and plastered. All the work, except the plastering and fitting of doors and windows, can be done by the owner, if he have ordinary skill in handling simple tools. Built after the plans given, the cost of the entire structure would be about six hundred dollars. There are plenty of settlers on government land in Dakota and elsewhere, who can pay the cost of such a house out of the profits of one year's crop, and have enough left for furnishing it, or for barns and out-buildings.

WEEVILS.—Mr. E. B. Bates, Snow Hill, Md., has a "more excellent way" of killing weevils in peas and beans, than that mentioned in the December *American Agriculturist* (page 559). He places the peas or beans in an open basket, and pours scalding water over them. The water runs off so rapidly as not to injure their germinating power, but plays havoc with the weevil. Dry and bag the seeds, and keep them in the smoke house for the winter.

Little Comforts for Farmers.

We say "little comforts," but the neglect of them often leads to large discomforts, if not to actual illness. Whoever does the "chores" upon the farm, whether the farmer himself, or his help, should be able to go to the barn and do all needed work in the barn and barn-yard, and come back to the house with feet as dry as when he went out.

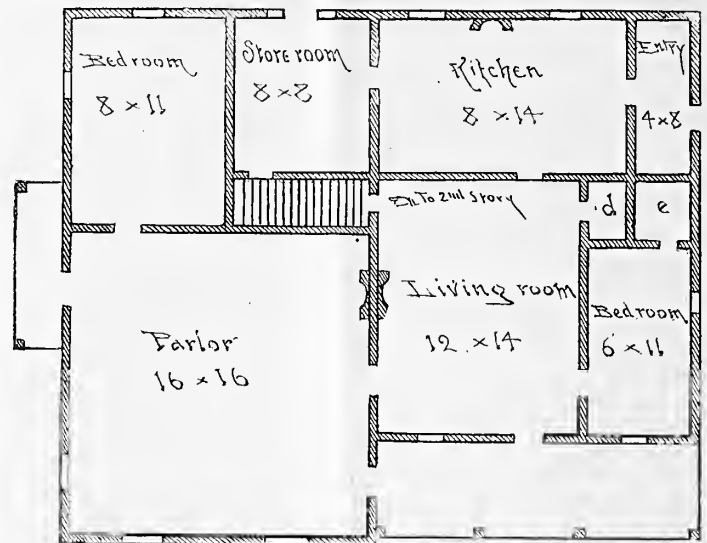

Fig. 3.—GROUND PLAN OF COMPLETED HOUSE.

Those who are at work in the wood-lot at chopping, or are engaged in rail splitting, will keep warm with the exercise, no matter how cold it may be. If they come home with wet feet, a cold and sickness are quite apt to follow. Dry feet, in all out-door farm-work, should be regarded as something more than a mere comfort—it is really an essential. Rubber boots will keep out all external moisture, but they confine the internal moisture, the insensible perspiration, and while they will answer for a brief exposure to mud and snow, one who wears them all day soon finds that his feet get parboiled and become exceedingly tender. For out-door winter work, strong boots, even heavy cowhides, made waterproof by a mixture which has been in use by New England fishermen for more than a century, and is in common use there in all sea-port towns, is much to be preferred. This is made by melting together four ounces of tallow, one ounce each of beeswax and rosin; when these are thor-

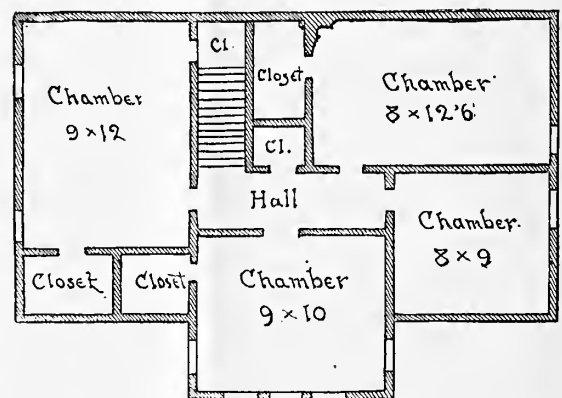

Fig. 4.—THE CHAMBER PLAN.

oughly melted and mixed, stir in an equal bulk of neat's-foot oil. This is applied to the boots, both uppers and soles, as they are warmed before the fire, rubbing it in well with a cloth or with the hands. To be thoroughly water-proof, the boots should have two coatings. It will at the same time keep the leather soft and pliable. Those who work at occupations requiring violent exercise, should, when they come in at night, change their underclothing which is dampened by perspiration. Keeping two suits to be worn on alternate days, to be changed on returning from work, is more than a "little comfort"—it is a great one. In the domestic economy of our people, we give very small place

to soups of any kind. If one has been at some work requiring unusually violent exercise, nothing is so refreshing, or will "set one up" more quickly and thoroughly than a cupful of strong beef tea or good mutton broth. If one has to ride or walk long in intensely cold weather, the ears, the most exposed portion, are liable to be frozen and cause much pain afterwards. Ear muffs, of some warm fabric, may be worn to cover the ears, or these may be bound close against the head, where they will be kept warm by using a thin woollen comforter.

The comfort of the farmer's family should not be overlooked. Very old farm-houses, and those that are cheaply built for temporary use until a better can be afforded, are often most uncomfortable in severe weather. Windows and doors admit the external air more freely than is required for ventilation. Weather-strips made of India rubber are very effective, but they are not to be had everywhere, and require more of an outlay than is always convenient. A little ingenuity will provide substitutes. For the windows, place small wedges between the upper and lower sashes, to prevent rattling, then paste on strips of brown paper to close all the cracks, using stiff flour paste, or that made from rye meal with a little alum added. It is well to leave one upper sash to be let down, as may be required for ventilation. Doors may be made tight by tacking tailor's listing or folded strips of woollen cloth along the sides and tops. The opening at the bottom of doors is usually the largest. For these, take pieces of small scantling, of the proper length, and cover with old carpet or other convenient fabric, stuffing the side which goes against the door, with wool, cotton, or even with hay, to make a sort of cushion. While it is well enough to have the kitchen door open directly into the room in summer, it is very uncomfortable for the inmates in winter. If possible, a storm door which can be closed before the kitchen door is opened, should be provided. This may be made in such a manner as to be taken away in warm weather and stored for future use. Sleeping rooms in farm-houses are usually cold. Those who suffer from cold feet should not be deterred from making themselves comfortable through fear or being thought "old womanish." If one cannot sleep on account of cold feet, he should warm them. Bottles of hot water will answer, but are not so good as blocks of soap-stone. Blocks of hard-wood, that have no turpentine, if placed in the stove oven early in the evening, will be found excellent foot warmers. In driving in the country in very cold weather, a foot warmer of some kind will add greatly to the comfort of those making the journey.

Treatment of Animal Ailments.

BY PROF. D. D. SLADE, M. D., V. S., HARVARD UNIVERSITY.

SWELLED LEGS IN HORSES.—A correspondent from Beaver Springs, Pa., writes: "What shall I do with my colt? At times her hind legs, and sometimes a front one, swell immediately above the fetlock joint up to the knee. When I drive her it goes away, and as soon as she gets into cold water, it swells up. Sometimes it comes of itself...." The affection shows a weak circulation, dependent upon constitutional causes; or to a low condition or debility, the result perhaps of improper or insufficient nourishment, or excessive or irregular work. *Treatment.*—Avoid exposure to wet and cold, and to cold currents of air upon the legs. Dry the limbs thoroughly by hand-rubbing, and apply a flannel bandage evenly from the foot up, continuing its use as long as the disposition to swelling lasts. Never allow the limbs to remain wet or muddy; a box stall is preferable. The diet should be abundant and varied, green roots, especially carrots, daily are essential. If the animal is at all out of condition, give half an ounce daily of pulverized gentian in the food, and if this is not sufficient, try two drams of sulphate of iron instead. Exercise regularly. The chief object of this is to improve the general health of the animal.

WORMS IN HORSES.—"C. H. M." writes from Hubbard, Ohio: "I have a horse, four years old last

spring, not doing well; he is poor and thin, and feed does him no good. He has been troubled with worms, about six inches long and as thick as a small slate pencil. He drinks much water, yet seems always to be dry, and passes a large quantity of clear urine. His appetite is good. I have given him calomel and tartar emetic, followed by linseed oil, and have seen no worms since. What shall I do to get him into good condition?...." The worms described inhabit the small intestines and are common. Examine the discharges frequently to notice if any worms are still present. The diet must be generous, with a liberal supply

Fig. 5.—EXTERIOR OF THE COMPLETED HOUSE.—Page 54.

of grain, varied by using roots, or green food. Give tonics daily with the food, such as two to four drams of sulphate of iron, or four drams of pulverized Gentian, or, the same of Columbo, until a decided change in condition appears. As the animal improves in health, there will be less chance of harboring parasites. Give plenty of exercise, warm and sunny shelter, and sufficient pure water. Pay great attention to the condition of the skin by proper grooming, and have due regard to strict cleanliness of the animal and his surroundings.

HEAVES.—W. G. Herron, of Carroll Co., Ohio, asks us: "What is the best remedy for heaves in horses?".... This affection is similar to asthma in man, and is dependent in most cases upon some structural changes in the lungs, induced by over-exertion. It is most frequent in old horses, but may be present in the young, especially if narrow or small-chested. The treatment can be only palliative; nothing can restore the altered lungs to their original condition, except possibly in very mild and recent cases. Give special attention to the food and its administration, feeding regularly that containing much nutriment in a small bulk. Therefore avoid hay, except a very small quantity at night, and that must be sweet and free from dust. Dry grain, carrots, turnips, potatoes, or any vegetables, form the best concentrated food. Bruised grain answers excellently well. Restrict the quantity of water, and give moderate exercise daily. No food should be taken for at least two hours before going to work, and the bowels must be kept loose. The rationale of the treatment is that as distention of the stomach or the intestines by coarse food or drink, presses upon the diaphragm, and hence upon the weakened lungs, impeding their free action and causing the symptoms presented; this distention must be guarded against, by giving sufficient food in small bulk, and at such times as will less interfere with the work. Such aromatics as Caraway seed, Cardamon, or Ginger, in one ounce doses, mixed in the drink or food, often relieves the flatulence and indigestion from which broken winded horses frequently suffer.

MURRAIN IN CATTLE. **SOUTHERN CATTLE FEVER.**—A correspondent at Kings Point, Tenn., asks: "What is the cause of murrain in cattle? Are the kidneys affected? What the cure? How can the disease be prevented?".... The term murrain has been, and is still, very loosely used. It has been applied to various animal plagues, but should be restricted in our country to the Southern cattle fever or Texas fever. It is a specific disease, due to contagion which takes place through the discharges from the bowels. The kidneys, as well as the other internal organs, are generally much disorganized. As yet no medical treatment has been discovered which can be relied on as certain in its

efficacy. Scientific research, still going on, may provide an antidote in the near future. Prevention can only be adopted by keeping the cattle from contaminated districts, until after the first severe frosts, which are supposed to destroy the virus.

SWINE PLAGUE.—"W. S. R.," Washington, Kan., asks us in relation to a sow which had a healthy litter of pigs, but died six or seven weeks after. He says: "She occasionally staggered, but this increased so that I took the pigs away. She was anxious to eat, but could not walk six feet without falling. Her back humped up, with all her feet in a bunch under her belly. She would lie five or six hours in the same position, but when disturbed would struggle and seem as if in great pain. She grew worse, so I ended her sufferings. One of the pigs died without any previous sickness, eating well at dark, and found dead in the morning. On examination, a hole about the size of a pin was found through the large intestine, from which some of the contents had escaped.".... The sow evidently died from the swine plague, which is a specific contagious disease, and very fatal. No treatment is advisable. Bury the carcass at once, beyond the reach of dogs, and watch the survivors for the first symptoms of the

disease, and separate immediately from the others. The pig died from peritonitis, no doubt induced by the perforation of the intestines. The perforation was probably the result of the stoppage of the bowel at this point, by an impacted mass of the contents, or by some other impediment.

Lights in the Barn.

It is estimated that nine-tenths of all fires are caused by carelessness. Now is the season when the lantern is frequently used in the barn, and we give a word of caution. Never light a lamp or lantern of any kind in the barn. Smokers may include their pipes and cigars in the above. The lantern should be lighted in the house or some out-building where no combustibles are stored. A lantern which does not burn well, should never be put in order in the hay mow. There is a great temptation to strike a match and re-light an extinguished lantern, wherever it may be. It is best to even feel one's way out to a safe place, than to run any risks. If the light is not kept in the hand, it should be hung up. Provide hooks in the various rooms where the lights are used. A wire running the whole length of the horse stable, at the rear of the stalls, and furnished with a sliding hook, is very convenient for night work with the horses. Some farmers are so careless, as to keep the lamp oil in the barn, and fill the lantern there while the wick is burning. Such risks are too great, even if the buildings are insured.

A Wrought Iron Unclimbable Gate.

The engraving shows the construction of a gate intended for situations much exposed to trespassers. It is made of upright strips of flat iron,

A WROUGHT IRON GATE.

pointed at the top, and fastened by rivets to a stout frame work of iron. The "pickets" are placed two to three inches apart, as desired for the appearance of the gate or according to the size of the poultry or animals to be kept from passing.

The White Birch.

It is surprising that the White Birch is so seldom seen in ornamental planting. Perhaps the abundance of the American variety in some localities has caused it to be regarded as too common. The preference for something from a distance, and costly, has caused many of our beautiful native trees and shrubs to be unwisely neglected. The White Birch has several varieties; the Poplar-leaved (*Betula alba* var. *populifolia*), which was at one time regarded as distinct, is common from Maine to Pennsylvania, especially near the coast. Our variety differs from the common White Birch of Europe (*B. alba*) in its more distinctly triangular leaves, and in being a much smaller tree; it is seldom over twenty or thirty feet high, while the other reaches sixty or eighty feet. In all the varieties the bark is of a chalky whiteness, and the slender branches and small leaves give the tree a peculiar light and airy appearance. Its graceful habit has caused it to be called "the Lady of the Woods." One variety, the Cut-leaved Weeping Birch, is especially beautiful; its branches are more pendulous than the others, while the deeply cut or lobed foliage is exceedingly light and open. One point in favor of these trees is, they all flourish in the poorest soils, though they grow faster in rich ones. Our native variety, so seldom used in planting, shows with fine effect when seen in contrast with the oaks and other trees having heavy, massive foliage. As a fuel, the White Birch does not rank high, but it makes excellent charcoal. On account of its rapid growth, and the fact that it will thrive almost anywhere, there may be localities too poor to yield better fuel, on which this may be profitably planted. It is propagated by seed.

The Grape-Seed Insect.

Mr. H. D. Stewart, Perry Co., Pa., sends us a quantity of grape seeds, in each one of which is a small grub. This is not a new pest of the vineyard, having been discovered in 1868, but it has seldom prevailed to any serious extent. The infested berries usually shrivel in midsummer, after which the swollen seeds are found to contain plump white grubs with brown jaws. The grubs change to chrysalids in the following spring, and the mature fly escapes through a hole in the seed in early summer. These flies are black, and less than a quarter of an inch long. The females deposit their eggs upon the skin of the grape, and the young grubs work their way into the immature

seeds soon after hatching. The best remedy yet suggested is to gather and burn the shrivelled fruit.

Early Spring Work.

JOHN M. STAHL.

"The early bird catches the worm;" as a general rule the early farmer makes the money. The one who has his oats first sown, his potatoes first planted, his ground first ready for the corn, his garden vegetables first in properly prepared

THE WHITE BIRCH.—Engraved for the American Agriculturist.

ground; in short, who is the earliest in his work in its season, is the farmer who raises the largest crops and makes the most money; and with good reason. He drives his work instead of being driven by it, and has time for doing it well. His products being early sell for a better price. Early vegetables, early poultry, early lambs and calves, always command the highest figures. His corn, wheat, oats, potatoes, vegetables, etc., have the entire season for growing and maturing. But this early work requires earlier planning and preparation. At the far South, garden and field operations begin this month. Further North a good deal may be done even now. Let us enumerate, by way of reminder, some of the many things to be done or thought about before the time comes for action:

Corn stubble may be speedily broken down while yet frozen, by dragging over the field a long pole with a horse hitched to each end. The manure may be hauled to the field over the ground while yet frozen, and no ruts will be made by the wagon wheels. Plows and harrows may be re-

paired at home, and taken to the shop to be sharpened. Harness may be cleaned and oiled; fields laid off into "lands" for plowing; washouts be filled; seed corn shelled and seed oats well cleaned in the barn while it is yet cold and stormy outside. Drags, rollers, cultivators and seeders may be looked after and got ready for use. Such little things as whiffle-trees, chains, oil cans and water jugs should be gathered and stored where they can be reached at once. Spades, shovels, hoes, forks, etc., should be brightened, sharpened, and repaired, if in need of it. The mow may be filled from the hay stacks. The summer's supply of wood should, by all means, be cut and stored under cover. Rails, posts, or boards for repairing fences may be hauled to their places, and the wood lot cleared up. The farm should be well supplied with gates, and now is a good time to make and hang them, or have them ready for hanging. Set the ash leach; smoke and store away the year's supply of pork; strengthen water fences and gates for the spring freshets. Pile and burn rubbish, and haul out the chip dirt. Repair the fences blown down by winds, or torn down by stock. Look after the well and pump, and clean the cistern ready for the spring rains. Remove garbage thoroughly from the cellar. Clean out the poultry-house and have new nests made. Have the yard tidied up. Pry or blow out stumps and clear off new ground ready for the plow; take out or bury large stones.

Clean off the garden; take the dead canes out of currants, gooseberries, raspberries and blackberries; trim the grape vines; cart manure on the ground; start early vegetables in hot-beds; select seeds, and buy any needed; select potatoes for planting; and look after the asparagus and strawberry beds. Grub out orchard trees that the winter has killed; prune, and pile and burn limbs removed; cover with wax any wounds made by rabbits or mice. Scrub down the orchard trees with suds from the week's washing. Scale the dead bark off of old trees. Manure the soil. Look after the bees. Trim osage orange hedges and burn the brush. See that you have good cocks in the poultry yard. Provide for coming calves and pigs.

In short, do spring work at the earliest possible moment, and endeavor to do it a little earlier than ever before. There will be plenty of work left when spring does come. The more time, the more thorough preparation of the soil for crops; and the more thorough its preparation the better the crops. Much time may be saved by having things ready. One should not have to hunt whiffle-trees, repair harness and implements, have plows sharpened, or go to borrow, in the spring—have everything ready.

California Dairy Statistics.

In connection with our special correspondent's account of Dairying in California (page 48), we have compiled a table of census statistics of the State and its leading dairy counties. In this we have introduced for comparison some figures of New York State (by far the largest dairy State), and of four of its leading butter and cheese counties. In cheese production California ranks second in the Union, but falls to sixteenth in its yield of butter, and to twenty-second in its number of milch cows. This table is as follows:

	Milch cows. Numb.	Butter. Pounds.	Cheese. Pounds.	Butter & Cheese, lbs.	lbs. per cow.
United States...	12,443,120	777,250,237	27,272,489	804,522,726	65
New York.....	1,487,835	111,922,423	8,362,590	120,285,013	84
Delaware Co....	57,673	7,732,028	25,898	7,757,926	135
Otsego "....	48,827	4,578,784	404,626	4,983,410	102
Herkimer "....	48,237	1,402,922	2,862,334	4,265,256	87
Steuben "....	37,254	3,886,985	138,830	4,025,815	108
California....	210,078	14,084,105	2,566,618	16,650,723	79
Marin Co....	24,698	2,507,888	65,100	2,573,488	104
Sonoma "....	18,336	1,895,523	217,870	2,113,393	115
S. L. Obis. "....	13,177	1,148,028	178,530	1,326,558	102
Humboldt "....	10,480	993,258	14,137	1,007,395	96
S. Clara "....	9,158	450,370	738,450	1,188,820	130
Sacram. "....	7,124	539,389	182,470	721,409	97
S. Mateo "....	6,691	283,031	28,215	311,246	85
Monterey "....	5,690	557,516	119,000	676,516	119
S. Cruz "....	3,445	350,060	102,500	452,560	131
S. Benito "....	2,712	120,410	173,320	293,730	108
Del Norte "....	2,189	218,950	57,300	276,250	137

It will be noted that as in New York, Delaware and Herkimer counties for example, one sec-

tion produces butter chiefly, and another cheese, as in California, Marin county makes butter mainly, while Santa Clara supplies nearly one-third of all the cheese that gives the State its second rank in this line.—Delaware Co., N. Y., and Del Norte Co., Cal., both butter counties, give the largest aggregate yield per cow; but Herkimer Co., N. Y., a cheese county, gives the lowest yield per cow, and Humboldt Co., Cal., a butter county, is next to the lowest.—The table condensed from the Census affords other interesting comparisons.

Portable Poultry Fence.

Mr. "D. R. C.," of Abington, Mass., sends us a sketch and writes: "It is often very convenient when poultry are inclosed during the growing season, to have a fence for the hen-yard which can be

A PORTABLE POULTRY FENCE.

readily moved from place to place. I have found the contrivance herewith, practical and satisfactory. Cut the posts the same length as the pickets, and to the inner side of each attach two strong iron hoops bent into a semi-circle, one near the bottom, and the other half way up. Through these hoops drive stakes fitted to fill them closely, with sharpened points for easily entering the ground. When removing the fence the posts can be slipped off.

Physical Comfort from Old Newspapers.

To be able to get for a few cents a neatly printed daily journal, having twenty-three feet of surface, on which, as a panorama, is spread out all the leading occurrences for four and twenty hours just passed, is certainly a great comfort.—But that is not the comfort we now have uppermost in mind; it is rather one that may be enjoyed all over the land in these chilly days, and especially in the abodes of the poor, in the dwellings out on the bleak prairies, on the stormy hill elevations, and in the frozen regions of the North. Let us illustrate by experience: Providence, or chance, placed the writer in a farm dwelling almost as old as our Government, on very high land, but so situated between the hills, that the mid-December western winds, gathered as in a funnel, swept through with terrific force, carrying off the heat from the house faster than a great box stove full of blazing hickory and black birch could produce it. But the worst thing was, that the aged floor, albeit of good matched pine plank, had shrunk until some air could and did sift in between the tongue-and-grooves; and, driven as it was by hurricane force, the thick home-made rag-carpet was often lifted high up, and it too sifted through the freezing air. In fact, the only way to keep warm was to put on extra thick clothing, and shielding the feet in arctics, keep them perched upon a supplementary chair. With more such days in prospect, we had about decided to fly at once to some more modern house, with hot-air furnaces and other conveniences, when, on opening a closet, we found a large bundle of various daily papers. No quicker thought of than executed, the carpet was raised, and those papers spread out ten to fifteen thicknesses all over the floor. They were laid down promiscuous-

ly so as to secure thorough "breaking of joints." Additional listing was put on the doors, and another two extra angles and joints were added to the stove-pipe, giving it a complete curve up and down and securing some more heating surface.

Result: We have now (Dec. 24,) just passed through the severest cold ever experienced when a thermometer was present to record it. Yesterday morning it was far below zero, and did not get above all day, while the winds were none of the quietest. But with one-third of the fuel used in the previous cold snap, our room is and has been as warm and comfortable as any furnace-heated city mansion. The extra pipe helped a little, but those newspapers did the thing! Why, even the most brittle "wood-pulp" newspapers are more impervious to wind currents than the thickest carpet. Three or four layers of them with the air spaces between, are as good non-conductors as a plastered wall with its minute air cracks, or as an ordinary bed spread; and one or two placed between the blankets are equal to an extra quilt, to keep in the warmth of the bodies of the sleepers.

Tacked on the beams over a cellar, a few thicknesses of newspapers are equal to an extra floor or ceiling placed there, in keeping the rooms above warm. Nailed up so that they will not be wet by rain, around the horse and cattle stalls, or the chicken abodes, or any buildings occupied by animals, human or otherwise, newspapers are warmer than the outer board siding, rough or planed; and they can be renewed at pleasure at no cost, and be removed in spring for additional ventilation. In short, the judicious use of newspapers may be made to save half the fuel in well-to-do homes, and supply its lack to the poverty-stricken. We call the special attention of benevolent societies to this fact. Farmers may by using newspapers save much feed otherwise used up by the animals in keeping warm. Eggs will be far more abundant if the hens are kept warm, by lining their winter quarters with newspapers, and stock poultry go through well on half the feed otherwise required.

A Revolving Sheep Hurdle.

An easily moved feeding hurdle is shown in the accompanying engraving. It consists of a stout pole or scantling of any convenient length, bored with two series of holes, alternating in nearly opposite directions, and twelve inches apart. Small poles five or six feet long are so placed in the holes that each adjoining pair makes the form of a letter X. These hurdles are arranged in a row across the field, and the sheep feed through the spaces between the slanting poles. The hurdles

A REVOLVING HURDLE FENCE.

are moved forward by revolving them, as shown in the engraving. By using two rows of these hurdles, sheep may be kept on a narrow strip of land, and given a fresh pasture daily by advancing the lines of hurdles. This method of feeding off a forage crop is one of the most effective and inexpensive for enriching worn-out land, especially if a daily ration of grain or oil-cake is given to the sheep.

Some Possibilities in Western Farming.

PROF. S. R. THOMPSON, NEB. AGRICULTURAL COLLEGE.

Many centuries ago an old Greek writer on farming said: "A farmer should be a seller and not a buyer." This maxim is as good to-day as it ever was. It is still the business of a farmer to produce for sale. Some things he must buy, but as a rule he will be the worse for it if he departs from his legitimate business to trench on that of the dealer by buying to sell again. In the regions west of the Missouri River farmers have to contend with two special difficulties: distance from market and want of capital. In any new country the first products are usually bulky, which aggravates the difficulties of distance from market. Not long ago it took the price of two bushels of corn to pay for transporting one; that is corn sold for twenty cents, and it cost forty cents to send a bushel to New York. The first remedy is to condense products before shipping. A bushel or fifty-six pounds of corn may be condensed into ten pounds of pork, which can be freighted anywhere for less than half it would cost to ship the corn. Grain may be condensed into butter and cheese by feeding it to cows. This condensation leads to other incidental but important advantages, notably a diversifying of products.

The most marked improvement in Western farming during the past decade is in this direction. But there is still room for more. Many thousand hogs are shipped alive to Chicago every year, and their cured meat is reshipped to the same place to be retailed. This double expense of freightage over many hundred miles is a waste of labor that ought to be stopped, and would be but for the scarcity of capital incident to new countries. Certainly every farmer should cure his own pork. There is absolutely no good reason why we should import canned corn from Maine, tomatoes from Maryland, not to mention pickles, beans, peas, cheese, crackers, etc. These can all be grown, and prepared here as cheaply as anywhere. It is safe to say that three bushels of sweet corn can be grown in Nebraska for what it costs to grow one in Maine, and perhaps the same may be said of tomatoes. Some of the idle Eastern capital might be invested here in canning factories and other ways with the certainty of a rich return.

So too in the line of sweets. For many years sorghum has been grown in a small way, and syrup made from it on farms. A considerable amount of profit has resulted; but the great drawback has been that the article made has often been poor, never uniform, and has found no regular market. With the coming in of steam sorghum works, where the amount of capital invested justifies the employment of experts, a different state of things has been brought about. A small steam factory in this neighborhood made some thirteen thousand gallons of syrup last season, all of which was taken by the wholesale grocers almost as soon as made. The return to the farmers raising the cane varied from twelve to thirty-three dollars per acre. The common yield was about twenty dollars per acre for the nustripped cane sold.—The cane crop seems peculiarly fitted for this soil and climate. It can be planted after corn is in the ground, and harvested before husking begins. In dry seasons when corn does poorly, sorghum usually makes an excellent crop. It requires a little more hard labor than corn, but returns more. Another crop for diversifying our agriculture is broom corn. It grows well, and wherever the necessary help for harvesting it can be procured at a moderate price the return is most satisfactory. Wherever it has been tried, any failure to give satisfaction has been due either to lack of knowledge by the grower as to the proper method of handling and disposing of it, or to the lack of the requisite extra help at harvest.

There are excellent openings throughout the West for the employment of capital in factories for making sorghum sugar and syrup, as there are for canning corn, tomatoes, beans, etc. Such establishments are needed by the agricultural community, and if judiciously managed will pay the investor well, and prove a benefit to the farm.

On the Road.

Coming Back.—We came upon them at the close of a September day, five miles from Columbus, Neb., their "schooner" anchored on the prairie sea for the night and the wanderers preparing their evening meal. The little Arabs tossed about in an extemporized hammock while father fetched the water from the stream and mother boiled the potatoes and broiled the grouse shot two hours before. Close by the horses were coralled. Old Towser, the faithful watch dog during all these long journeyings—stretched under the wagon waiting his finish at the victuals, which, however, a soaring hawk apparently believed would fall to his lot. It was a most picturesque scene, as the setting sun cast a flood of light upon all around, and then disappeared beneath the

billowy grass, just as one sees the bright orb drop below the ocean waves.—They had been travelling all day, poor things. Man and beast were weary and worn. They had been to the far West, and were now wending their way slowly back home east of the Mississippi, heartsick and disappointed with days and weeks of travel before them. We did not question them too closely, but it was plain to observe that they belonged to that large class who push for the far West without sufficient forethought and preparation. Very many reach their destination in safety, construct a sod house, break a few acres, and then have not means to tide them over until they can harvest a crop. Others lose their crops and are unable to winter. Still others become discouraged owing to sickness and other causes, and are bound to get back East again, no matter at what sacrifice. If they have not funds to carry them back by rail they drive back, consuming weeks and even months in making the return trip. So it transpires that at certain seasons and in certain localities in the Western States and Territories, claims and breakings can be bought from discouraged owners at a fraction of their value. Frequently the disheartened settler, after he has built his house, made his first payment, and broken thirty acres or more, will "let the whole business slide" for enough to carry him and his family out of the country. During the grasshopper period, the prairie roads of Kansas and Nebraska were at times fairly alive with returning settlers, whose crops had been devoured, and whose claims were being bought at a song by cormorant speculators or old and new comers who had more faith in the future of the country. In 1875-6 and 7, the railroads experienced great difficulty in selling their lands in some portions of Kansas and Nebraska, the abandoned claims were so numerous and sold at such low figures. Often the deserters after remaining East for a year or more, will return again to find the claims which they gave up now held by thrifty occupants and very valuable. So they have to push on still further away from the railroads, where lands are cheaper, and begin all over again. Moral—Don't be tempted by the alluring advertisements of some railroad to start for the new West, before you are fully equipped. And when you do start, go expecting to encounter hardships, and determined to stick it out, though grasshoppers, or short crops, or rainy seasons, or blasting winters are among your earlier experiences. Then time will bring you out all right.

Rapid Transformation Scenes in the Far West.—In previous numbers we have spoken of the wonderful growth of villages and towns in Dakota

and elsewhere. For example how Huron, which two years since had no existence, is now a flourishing place, with any number of hotels, churches, etc., etc., and how Blunt, which at the beginning of 1883 was not located, now has a thriving population, and an opera house capable of accommodating six or seven hundred people. A letter just received from Wolsey, a few miles west of Huron, says:—"Since you passed through Huron (last September) the Chicago, Milwaukee & St. Paul R. R., has passed through Wolsey, and the latter place, at the time of your visit having but three or four buildings, has now two hotels, two depots, three lumber yards, quite a number of stores, two saloons, a school-house, and a prospective five thousand dollar Presbyterian church.

I should be able to show my comrades at Pinkham's, when they rose for breakfast. Judge of my chagrin and remorse when, upon drawing near to the dying animal, I discovered that I had shot a doe. Instead of scampering rapidly away, as they naturally would have done, the fawns remained close to their mother in her death struggles. With their beautiful gazelle eyes they cast such piteous, reproving looks at me, as one could never forget; it was a scene to move a heart of stone. For days af-

Woonsocket, without existence at the time you passed here, located midway between Mitchell and Wolsey, on the Milwaukee Road, has had a more phenomenal growth."—While towns and villages spring up with wonderful rapidity in the far West they often disappear with equal rapidity. At various points along the Union Pacific and other roads in Wyoming and elsewhere, the traveler is pointed out the ruins, at times almost indistinguishable, of what were once, when the railroads were building, villages of one, two, three, five and as high as seven thousand inhabitants; now all vestiges of many of these have disappeared. One evening a party of us were sitting in the superintendent's office at Oneida, Utah, the then terminus of the Utah Northern Road, when we were informed that upon the following day the entire village was to be moved to the termination of another section of the Road, which had just been completed. We did not remain to take part in the transfer, but were subsequently informed that the entire village was bodily transferred in twenty-four hours' time, on wagons and upon cars,

My First Antelope.—We scurried over the desert plains south of Laramie, Wyoming, skirted Sheep Mountain, entered North Park, and after a fifty-five mile drive, rested at far-famed Pinkham's for the night.

terwards on driving from point to point in North Park, we encountered large droves of these antelopes. Frequently they remained, just like so many calves in the barn-yard, until we had ridden fairly on to them. I could never persuade myself to shoot another of these beautiful animals except as needed for food. Sportsmen who delight in shooting the beautiful creatures one after another, are nothing less than inhuman hutchers.

Wonderful Physical Formations.—The rugged foot-hills, the buttes and configured rocks, in the far West, are a source of not a little curiosity to the sight-seer who looks upon them for the first time. Moving westward from Bismarck to the Yellowstone, one sees these physical formations for miles and miles away, standing boldly out on the prairies like so many lonely sentinels. In Central and Southern Colorado they are perhaps more frequent than elsewhere. Riding down on the railroad train from Denver to Colorado Springs and Manitou, the traveler sees these sandstone and other formations of every shape and variety. The engraving represents one which every visitor to this region of the State does not fail to visit. It is located not far from Manitou, and like many other similar configurations around, it indicates what a wonderful upheaval our Continent must have been subject to, not so many centuries away, either. The Garden of the Gods, near Manitou, comprises a most wonderful collection of these geological formations. We spent a day very pleasantly in studying them, and at some future time shall describe them at length.

All day long we kept up a fusillade at antelope in the distance, but without effect. At daybreak I swung my Sharpe's carbine over my shoulder, mounted my horse, and started for a group of antelope a mile or more away. When within a thousand yards I dismounted, and for three hundred yards crawled cautiously through the long grass. They appeared to be a buck and two does. Reclining at full length, and, taking long and deliberate aim at the larger of the three, I was highly elated to see the snapposed buck spring in the air and fall to the ground. Returning, and remounting my horse, I rode rapidly towards the wounded animal, elated at the prize

Rail Road Building.—As compared to population, rail road building is now far greater in the far West than in the Middle or Eastern States. It will not be long before Kansas, Nebraska, and Dakota will be covered with a network of railroads, fully as extensive as prevails any where in the older States. The fares on these Western roads, which have generally been too high, are now coming down. Of course the new roads have no land grants which have proved such signal aids to Western railroad pushing in the past. It is not impossible that some of the grants now held may be repealed by Congress during the coming winter.

Farming versus Mining.—Very many of the earlier adventurers who came to Montana and Colorado, expecting to make their fortunes in mining operations, have now turned their attention to farming. Cattle and sheep raising, and farming, where too much irrigation is not required, are more certain of profitable returns in the long run than any mere mining operation. Western Colorado promises to soon show very handsome farms.

One Hundred and Twenty Thousand Miles!—Next to Agriculture and closely connected with it, by far the greatest interest of our country is the railroad system, an interest nearly unknown a short fifty years ago. Half of it is the growth of about a dozen years past as the mileage at the beginning of 1872 was just half of that at the end of 1883! The figures, brought up to Christmas, show the construction of 6,600 miles during the past year, making a total length in the United States of 119,421 miles, and the 79 miles lacking for a round 120,000 will be finished before this can reach the eye of the reader. Last year's new construction exceeded the entire length in existence here only thirty-five years ago. Taking the last census figures for agriculture, and reckoning the past year's building of railroads at the previous average cost per mile, we have:

Value of Farms in United States, including buildings, fences, etc., (Census 1880)	\$10,197,096,776
Value of all Farm Animals	1,500,461,609
Farm Implements and Machinery	406,520,035
Total Invested in Agriculture	\$12,104,081,440
Total Invested in Railroads in U.S. (Jan 1, '84)	\$7,270,000,000

That is, \$600 have been used in building railroads for every \$1,000 value of farms, fixtures and live stock reported in last census—and the chief business of the railroads is carrying farm products. Of the 770 million dollars earned by railroads for 1882, the latest reports made up, 202 millions came from passengers, 506 millions direct from freight carried, and of the remaining 62 millions from miscellaneous sources, a large share was for freight carried by express companies.—Query—Would the farms of the country have one-half or even one-third their present cash value, if there were no railroads?—The following table shows at a glance the annual progress:

RAILROADS IN OPERATION IN THE UNITED STATES.

Year.	Miles.	Year.	Miles.	Year.	Miles.
1830	23	1845	5,996	1866	36,801
1831	35	1846	7,366	1867	39,250
1832	229	1847	9,021	1868	42,229
1833	380	1848	10,982	1869	46,844
1834	638	1849	12,908	1870	52,914
1835	1,098	1850	15,360	1871	60,283
1836	1,273	1851	16,720	1872	66,171
1837	1,497	1852	18,374	1873	70,278
1838	1,913	1853	22,013	1874	72,383
1839	2,302	1854	24,503	1875	74,096
1840	2,818	1855	26,968	1876	76,808
1841	3,535	1856	28,789	1877	79,089
1842	4,026	1857	30,635	1878	81,776
1843	4,185	1858	31,286	1879	86,497
1844	4,377	1859	32,120	1880	91,444
1845	4,633	1860	33,170	1881	101,733
1846	4,930	1861	33,908	1882	113,339
1847	5,551	1862	35,085	1883	119,421

Note that the mileage doubled between 1850 and 1855, and again between 1866 and 1874, and between 1871 and 1883; that with two exceptions less than 3,000 miles were built in a year prior to 1869; that more miles were built in 1882 than existed in 1852.

Other Striking Figures.—During the year 1882, the latest period for which reports have been received, the railroads carried $7\frac{1}{2}$ times as many passengers (375,351,812), as the entire census population of the country! Of these, over 86 millions rode on the elevated railroads in N. Y. City. Leaving these out, the steam railroads of the Middle States carried 13 times the population of these States (N. Y., N. J., Pa., Md., Del. and W. Va.). More striking still are the freight statistics. During the year the railroads carried 360,490,375 tons, or 720,980,750,000 pounds—equal to an average of 14,414 lbs., or over 7 tons for each of fifty million men, women and children! This was all carried an average of 108 $\frac{3}{4}$ miles—equal to carrying a ton nearly forty billions of miles (36,302,209,249 miles), or nearly sixteen hundred thousand times around the world, over two hundred times to the sun and back! And the average charge for the whole country was only 1 cent and 2 mills per mile, for carrying a ton of freight—in the Middle States only one cent per ton per mile. Imagine a team hauling a ton of grain 25 miles for 25 cents, including driver, team, wagon, loading and unloading, and boarding themselves!

Interesting and Remarkable Comparisons.—Hitch up all the teams in the United States and Territories. The census gives us nearly half a million (496,920) yokes of working oxen, and over ten millions (10,357,488) horses, with near two million (1,812,808) mules and asses. The last two, if two-thirds are in working age and condition, would give us over four million spans; or with the oxen about four and a half million (4,553,685) teams. These teams to do the hauling done by the railways, would each have to draw a ton over 8,639 miles! In other words, in order to transport the freight now carried by railroads, every team in the country would have to pull a ton weight about 29 miles a day, during three hundred days a year, and at the average railroad charges, would receive about 34 cents a day, for man, team and wagon, out of this pay board, feed and repairs; the balance for wages, interest and wear! But allowing for return trips, each team going 1 $\frac{1}{2}$ miles a day and back, our whole team force would have to be doubled to do the freighting now done by the railroads.

Chat with Readers.

Labor-Saving Devices.—Mr. W. A. Roberts, Center Ridge, Kans.—Please accept our thanks for kind words, and the sketch and description of a feed rack, and other aids in farm operations. We are always pleased to hear in like manner from our subscribers in all sections of the country.

The Best Book.—"G. W. K." N. H., asks: "What is the best book for information upon general farm subjects?"—The best work for general reference is, "Allen's New American Farm Book." The author was a practical farmer, and gives just the information that farmers are most likely to need.

Hydraulic Lime.—A correspondent who does not wish his name given, asks: "Will Hydraulic Lime do as a substitute for cement in concrete?"—Hydraulic Lime and Cement are names for the same thing. In England it is called Portland Cement, and on the continent of Europe, Pozzolana. In this country, that from a particular locality is called Rosedale Cement.

Good Returns.—J. Coe, Ill., (who omitted to give his town), writes us that he was induced, by seeing an article in our pages, to make a bed or patch of Water Cresses. He now values his patch as worth at least one thousand dollars. He was selling five dollars worth weekly even in October, which is quite out of season. No wonder that Mr. C. writes: "the *American Agriculturist* just suits me."

Utilizing Slaughter-House Refuse.—C. Souder, Atlantic Co., N. J.—This consists of scraps of flesh, entrails, blood and other animal offal. It may be decomposed by covering it with muck, or even with common earth. The least troublesome method of disposing of the refuse, would be to place it in the manure heap, distributing it to prevent violent heating. It will add to the value of the manure.

Heating a Poultry House.—"C. E. M." Fall River, Mass., asks the most economical method of warming a poultry house. The best method of warming a plant house, will no doubt be best for poultry. This is by circulating hot-water in iron pipes. Portable heaters are now made on the principle of the base-burner stove, which are effective, and require no more care than ordinary stoves.

Use of Potash Ley.—"G. W. K." Merrimac Co., N. H., asks if there is any fertilizing value in potash ley, in which corn has been hulled. The corn can remove very little if any potash from the ley, which is undoubtedly of value. The best way to use it, and other fertilizing materials of which one has but a small quantity, is to scatter it upon the manure heap. Whatever there is of value will be saved, and it will add to the richness of the manure.

Sweet Potato Plants.—W. S. Spencer, Norfolk, Neb. Persons who desire only a few sweet potato plants, and live near large cities, can usually buy them cheaper than to raise them. The young plants will bear transportation well if properly packed. Gardeners who wish these plants in larger quantities, should grow them at home. There is a small book with full directions for raising sweet potatoes, published by the Orange Judd Co., price fifty cts., post-paid.

An Onion Question.—"A. C. I."—With reference to an article in December last, where we speak of "Potato Onions, or Multipliers," asks whether the names do not belong to two distinct kinds of onions. We first knew the onion many years ago, in a Western State, as "English Multiplier," and "Multiplier." We first heard the name "Potato" applied to the same onion, when we came East. The onion is more or less flat, or somewhat long, according to the shape of those selected for planting.

Fifty Acres of Pasture.—"G. H. P." Teagus, Mo., is about to lay down fifty acres in pasture, but he wants hay for next winter. He has been advised to sow rye with the grass-seed, and by cutting early make hay of it. He asks our opinion. Rye makes such large clumps of roots, that we should prefer to sow oats with the grass. If cut early, oats will make a more nutritious hay than rye. If any of our readers have sown rye under such circumstances, will they give us their experience?

Mulching Tomato Vines.—E. D. Moore, East Saginaw, Mich., makes frames, or bottomless boxes, seven inches square, and four and a half inches high, of half-inch stuff well nailed together. After the plants are set out, one of the frames is placed over each, having the plant in the center. The frame is then filled to within half an inch of the top, with fine sawdust. The sawdust acts as a mulch to prevent the evaporation of moisture from the soil. If in a long drouth it becomes necessary to water the plants, the water can be applied through the sawdust, and the baking of the surface of the soil avoided.

Netherlands International Exhibition.—Holsteins.—"J. H." Rye, N. Y.—An exhibition will be held at Amsterdam this year, from August 25th to September 6th. The programme offers premiums for exhibits "from all other countries," besides those for home products. Those in this country who claim that there is a breed of cattle known as "Holstein," must be at loss to explain why, in a large agricultural exhibition, held in the alleged country of the "Holsteins," no notice is taken of that breed in the prize schedules. The liberal premiums offered for agricultural machinery and implements should induce our manufacturers to be represented at this exhibition.

How to Use Hen Manure?—This question comes from several subscribers. The condition of the manure differs with the management of the poultry house. If the house is swept daily, and the space under the roosts is covered with earth to receive the droppings, no preparation will be needed. If, as usual, the manure is allowed to accumulate, and only occasionally removed, it

comes out in solid masses or lumps. The lumps must be broken up by a pounder, and the manure sifted and mixed with dry peat, or dry woods-earth, or in the absence of these, dry soil may be used. Mixed one part to ten of muck, etc., it will be useful upon farm and garden crops.

Cinquefoil or Five-Finger as a Weed.—"E." Belknap, Pa., sends a vine and asks how to get rid of it. The plant is evidently Cinquefoil (*Potentilla Canadensis*), also called "Five-finger." We never before heard of its being aggressive as a weed, though it sometimes over-runs fields, the soil of which is not fit for any other purpose. There is no special application that will kill one plant and not another, and weeds must be crowded out by occupying the soil with other plants. Cinquefoil, so far as we have seen it, grows upon land too poor to be worth cultivating, unless enriched. A crop of Buckwheat would no doubt smother the plant, and this may be turned under to enrich the soil.

Guenon's Escutcheon.—"A. T. Y." Wheaton, Ill.—It would not be possible to present the "Escutcheon theory" in full, if we gave up the whole paper to it, and an abstract, to be of any use, would require more room than can properly be given to one topic. One to make use of Guenon's rules for judging cows, needs to have the diagrams before him, and these are given, with the descriptions, in a book which is a much more convenient form than the paper would be. As to the value of this method of judging the milking capacity of cows, we find that the most intelligent breeders, while they do not depend upon it altogether, find it of too much value to be ignored.

Russian Apples.—L. Smith, Bruley Co., Dakota, asks: "Are the Russian apples any better than our own?" The nurserymen praise them extravagantly, and ask about twice as much for them as for Ben. Davis, Winesap, and other well known kinds. Is there any humbug about Russian apples?—The best of the Russian varieties are not equal in quality to the best of our own, but they are much harder, and will give fruit where the others fail. There is no reason for planting them where other apples can be relied upon, but where it is a question of Russian apples or none, they are valuable. The number of tested Russian varieties is as yet small, and these have not yet been propagated so largely as others, hence the higher price.

How Many Fowls.—"A Reader," in New York City, asks how many fowls can be kept in a house ten by fifteen feet, with a yard ten by eighty-five feet. Also, how many nests should such a house have. From twenty-four of the large fowls, such as Brahmas, to thirty-six of the small breeds, such as Leghorns, may be kept. The number that can be safely kept in one inclosure, depends upon the care given to cleanliness. If the floor is daily covered with dry earth or coal ashes, and daily cleaned, the numbers here given may be exceeded. The house must be perfectly dry, and provided with means for ample ventilation. As to the number of nests, probably one-third as many as there are hens will be sufficient. We would suggest that a portion of the yard be occupied by a shed or covered run, in which the birds can take exercise and dust themselves in stormy weather.

Sheep Raising.—Mr. C. Grant, Baltimore, Md.—It is not possible to estimate with accuracy, the increase in the number of a flock of sheep for a period of five or ten years. In general the twins will make up the losses of lambs by death, so that the increase will be equal to the number of mothers each year in the flock. The profits upon one thousand head of sheep depend upon so many things, that they cannot be closely calculated. Much depends upon the healthfulness, age, size, etc., of the sheep, and the abundance of dogs; the cost of feed both winter and summer; and the care given to the flock. A hundred early lambs, well-fattened for early spring market, will sometimes bring a greater profit than ten times as many late lambs raised for wool. But only the best favored can succeed with early lambs, and they need to be pure, or half-blood mutton-sheep. The market price of wool, and the cost of producing it, are the leading factors in the problem of profitable sheep raising in the far West.

The Peach-Tree Borer.—Mr. Geo. M. Caywood, Ewing, Ky.—The Borer is a wide-spread and destructive pest in the peach orchard. The mature insect is a moth, which appears from the middle of July to the last of August. The female deposits her eggs singly on the bark of the tree, near the surface of the soil. The young borers work downward into the roots, forming small winding channels. A full-grown borer is half an inch long, and is soft, pale yellow, and with strong black jaws. The borers make leathery cocoons out of castings or "sawdust," gum and silk, in which they remain in the inactive or pupa state, near the surface of the soil. If the earth is loose, the cocoons may be an inch or more below the surface. There are several remedies, and more preventive measures for this pest. The presence of the borer is known by the dust and exudation of gum, and when these are found, the burrow should be probed with a slip of whalebone, or a short wire, and the borer killed. Hot water is sometimes used, the earth around the base of the tree having been removed. The knife and probe used in late autumn or early spring, are the most effective means of reaching and killing the borer. Care should be taken not to cut the tree more than necessary. Among preventive measures, is the banking of the tree with earth for a foot or so. This mound with the earth firmly pressed around the tree, may be permanent, or better still, thrown up in spring, and leveled in autumn, after the season of egg-laying is passed. Ashes and cinders are sometimes heaped around the trees instead of mounds of earth. A covering of stout paper, a plastering of clay, or a wash of tobacco water may help to keep the egg-laying moth away from the trunk of the tree during the summer.

Road Making.—Mr. J. W. Sanborn, Centre Point, Iowa, writes us that the almost universal error in road making in low land consists in raising the road-bed with earth taken from the adjoining sides, thus making a reservoir for water to keep the road wet. The earth should be hauled from higher ground.

Egg Refrigerator.—Mr. H. J. Meixell, Ephrata, Pa.—The cost of a cold house, holding a thousand to fifteen hundred barrels of eggs, will vary greatly, according to the quality of material and the manner of construction. The cold rooms in New York and other cities, are mostly arranged inside of other buildings, and the cost can not be well estimated.

Hedge Plants.—The thorn, or quick-set hedge, so much used in England, is not suited to this country. Our long hot summers are unfavorable, and it drops its foliage early; besides, it is attacked by numerous insects. The best hedge plant is the Osage Orange, for all localities in which it will flourish, for other and colder places, the Three-thorned Acacia and Buckthorn.

The Ohio Agricultural Experiment Station.—The director, W. R. Lazenby, evidently comes to his work with enthusiasm, and, in the phrase of the day, "means business." He has taken up Injurious Insects and Weeds, subjects of the highest importance to every farmer. With a view to acquire full information, circulars are sent out, asking farmers to give the names of the principal insects and weeds that interfere with the cultivation of the leading crops. We hope that our many friends in Ohio will promptly respond to these questions, and thus lend a helping hand to the proposed useful work. Those Ohio farmers who have not received the circulars referred to, can procure them by applying to Director Lazenby, at Columbus, O.

Light Brahma Fowls.—J. J. Read, Iowa, asks us if by "Light Brahmas, we mean the buff, or is it the large silver-gray Brahma, or Cochin?"—Our correspondent has evidently mixed the breeds. The Cochins all have a flat or erect comb, while that of the Brahmas is a very low "pea-comb." In the dark Brahma, black and gray predominate, while the light Brahma is nearly white, handsomely varied with a black tail; the neck hackles have a black stripe down the middle of each feather, and some other black markings. The breeder of either claims that his is the best variety, and there is probably little difference between them. You will find that several dealers advertise Light Brahma eggs in our columns at the proper season. Believing that all our advertisers will do as they propose, we can not recommend one in preference to the others.

Pine Trees and Lightning.—"W. E. K., Ionia Co., Mich., writes us: In the September number of the *American Agriculturist*, you speak of the notion prevalent in some localities that the pine tree is lightning-proof. This superstition can hardly exist where both pine trees and lightning are as common as in Michigan. A pine tree one hundred feet high is too plain a target to be missed by lightning, and scarred veterans are frequently to be met with in all pine forests. Isolated trees seem to be more severely injured than those in a forest, for obvious reasons. A large pine, thirty inches in diameter, and eighty feet high, standing in a door-yard near here, was struck by lightning, and shattered into fragments. The largest splinter left would hardly do for a fence rail. A broken pine a few feet from my own residence, is a witness that it is not lightning proof, and also disproves the old saying that, "lightning never strikes twice in the same place." To my knowledge it has been struck four times by lightning. Its height has been reduced from one hundred to fifty feet by the repeated strokes.—[Yes, and we this moment see on a hill before the window where we write, a lone pine a foot or so in diameter, perhaps fifty feet high, of which nearly half of the trunk has been struck off by lightning, and the near residents say that, "that tree gets a lightning whack almost every year"; and the wonder is that it stands it so long.—Ed.]

About Mullein.—J. W. M. Appleton, Salt Sulphur Springs, West Va., writes us that in clearing hushy land he finds that mullein comes up so thickly that he fears it will choke out the grass, and asks how to eradicate it. The manner of growth of a weed often suggests the method of warfare against it. The mullein

is a biennial. The first year it forms a tuft of broad leaves which lie close to the ground, and in this state it passes the winter. The next spring it throws up a tall stem which flowers, and in autumn the plant dies. There will be no more trouble from that plant, but before it "expires by its own limitation," it has ripened and dropped its multitudes of seeds; the ground for several feet around is thickly stocked with them, and they will continue to produce fresh crops for years. It is evident that to keep the plant from continuing, the flower-stems should be cut off before the seeds are ripe. As the seeds are not provided with wings or other appendages by which they may be scattered, if the stems are persistently cut off, the plant will disappear in a few years. But the ground in the present case is well-seeded to mullein. Earlier in the season it should have been plowed, sown with rye and seeded to grass. It may be well to try the same thing next season with oats. By plowing under the mullein plants, the grain will cover the ground before a new crop of them can get established. If oats are not desirable, try cow-peas or buckwheat as a cleansing crop, and sow grass next fall.

Sensation in Hookertown.

Two Sides to the Question.

Mr. Edron.—As you wanted me to keep you posted on the news in these parts, I send you a few notes on the last sensation in our town. We have no newspaper printed here now, but there is about as much news circulating as if we had a dozen, and it is just about as important. Tongues were made before types, and need no setting up. You see, last summer Polly Friuk came over to our house one morning, looking as glum as could be, and said she, "Mrs. Bunker, what do you think happened over to our house last night?"—"I can't tell," said Sally; "maybe a weasel was around."

"No, it weren't," said Polly, "but somethin' 'nuff sight wus, in the mischief he duz. A skunk got into my chicken coop and killed a hull brood of chickens jest come off. It made me heart-sick when I went out to feed 'em this mornin'. Ye see, old Bose tackled the skunk arter he had killed the chickens, but he got the wust of it, and his eyes are all bunged up this morning, and I'm afraid we must bury the dog to git red of the smell. It's jest orful."

"Skunks are getting to be too plenty for comfort or profit," Sally replied. "Timothy found six hills of Marblehead squashes dug up by the varmints. You see, he made a large border for each hill, and put in more'n half a bushel of manure, and worms hred in the hills, and the skunks, in rooting for grubs, tore up the young plants, and 'twas too late to plant again. I wouldn't have had it done for five dollars, for I was 'lotted on the Marbleheads for Thanksgiving pies."

"Well," said Polly, "I got off as well as some of my neighbors, I guess. Deacon Smith had all his young ducks killed one night last week, and Jotham Sparrowgrass lost twenty turkeys just off the nest. Uncle Jotham says he's about ruined, for he was 'lotted on the turkey money to pay the hired man. Tirzah Twiggs said last night they had lost thirty-five young chickens this season, and she was about discouraged. She guessed Seth Twiggs would have to go without his chicken pie at Thanksgiving, unless something was done to head off the skunks."

This is a fair sample of the talk going on in Hookertown, indoors and out, all the summer and fall. Skunks have kept the field several years, without let or hindrance, except occasionally an old trapper caught one for his hide or for a little oil for medicinal use. Dogs of every breed fight shy of them after a first experience, and bark at a safe distance from the loaded muzzle. They invaded fields and gardens. Their snouts probed corn and potato hills, rooted up young garden plants, robbed bee's nests in exposed situations, devoured young poultry of all sorts, and were a general nuisance by night. Things reached fever heat before town meeting, and Zeke Simons said "somethin' had got to be done, or Hookertown would become a howlin' wilderness agin. Folks and skunks could not live together much longer." This was the prevailing opinion, and in the town meeting warning, one item of business was, "to determine whether the town would put a bounty upon foxes, skunks, and woodchucks." The foxes had been doing a brisk business through the summer, and took a good part of the turkeys and geese that the skunks left when they got big enough to make a square meal for the young fox family. Stealing poultry was not so generally charged to the woodchucks, but they tangled the clover fields badly, and revelled among both field and garden beans and other crops. They dug up the ground in thousands of places, leaving heaps of soil everywhere, and many horses and cattle were badly lamed by stepping into their lookout holes, which had no warning dirt piles. They helped the skunks to hiding places in their safe underground retreats, convenient at every point. They too must vacate Hookertown.

Town-meeting came, and the skunks drew more of a crowd and excited more interest than politics. It turned out an experience meeting, in which farmers told of their losses, amounting to a good many hundred dollars. Zeke Simons said: "As near as I can calculate, it costs Hookertown about five thousand dollars a year to support its fox, skunk, and woodchuck population. We have over five hundred or more farms in town, many of them large and with plenty of range for turkeys. Some have good ponds and brooks for raising water-fowl. The average loss to farmers from these beasts is at least ten dollars, not only in eggs stolen, the sitting hens broken up, and the young and old ones killed, but the fear of these depredations lessens poultry raising. Men are afraid to breed turkeys mainly on this account, and large numbers do not keep them. Many have only a trio or quartet, where they might just as well have a dozen. There is range enough and feed enough on many farms here, chestnuts, acorns, berries, insects, and grass, to keep two hundred young turkeys from June to October, without drawing on the corn-bin. These birds, well fattened, would bring four or five hundred dollars in our village and city markets. Raising poultry would be one of the most profitable branches of farming if the town was cleared of these vermin. He was for a war of extermination, and hoped they would put a bounty on and keep it on until foxes, skunks, and woodchucks were as scarce as wolves and bears."

George Washington Tucker, who is fond of skunk hunting, and does quite a business in their oil and pelts, said: "I don't 'zaety understand what all this fuss is about. The Almighty made skunks, and I guess they are about as useful as some other critters that go about on tew legs. They kill insects that spile the farmers' crops. Nobody could deny that. They get fat on bugs and worms, and the ile was worth a dollar a gallon. There's nothin' like it for reumatism. The skins bring a good price, and roast skunk, ef a man knows how to dress 'em, is not bad eatin'. This puttin' a bounty on skunks, was takin' bread out of the mouths of poor folks. I like to go skunk hunting, and am agin this bounty."

Tucker's views had little weight with the meeting. A dollar bounty was put upon the fox, and a quarter of a dollar upon the skunk and woodchuck. A general slaughter of the skunks commenced soon after the meeting, and they need no monument. The fox hunts will come off when the snow falls. The hounds are on hand, and the old hunters have their guns and ammunition in readiness. We shall not need the Newport gentry and their ladies at the meet. Hookertown will do its own fox hunting, without dog-cart or saddle, broken bones, destroyed crops, or damaged fences. The woodchucks will take their chances in the spring, when they come out of winter quarters.

As for the skunk, the bounty on his head is by no means a sure test of his merit. There is a good deal of human nature about him—not wholly good, not altogether bad. There is no denying he is very bad in spots. That odor is terrible, as all Hookertown will testify—since the town meeting. You cannot go out for an evening to call on your neighbors, without inhaling it, and you are fortunate if you do not run a foul of the pest. And if you fall under his batteries, your garments have a perfume that no oil of rose can smother, no burial in charcoal or peat can deodorize. It is as fast as if it had been dyed in the wool. They must be banished from civilized use. This is the strong point of the animal unquestionably, and the suffocating odor will always be an effectual argument against him. But then he has his legitimate uses, and Hookertown has impeached its own wisdom in setting the same price on his head as upon the woodchuck. This marmot digs his den in your clover field, or on the border of your garden, and gloats over the prospect of high living on your clover blossoms, and bean pods. The skunk is one of the best scavengers among the insects which prey upon the farmer's crops. He is always at it, doing his work mostly by night while you are asleep, and does not intrude upon your labors by day. His scent-bag is his weapon of defence—only used when he is assailed. He is peaceable, and inodorous if you let him alone. "Ah!" you say; "but he eats eggs, and kills chickens." But don't you invite him to these repasts, by your careless poultry management? A poultry house with a door shut at night would make your eggs and chickens safe from his raids. "Ah! but he kills many young turkeys just as they are hatching." Then make your turkey-nests vermin-proof, and teach the turkey-hens to lay in them. This is done on many a farm, and it can be done on yours, and it guards against foxes as well. In any fair account kept with the skunk, the balance must be struck in his favor. Thus among the animals, we often find friends under the most unpromising appearances, and badly abused men are not unfrequently the benefactors of society.

Yours to command,
TIMOTHY BUNKER, Esq.
HOOKERTOWN, Dec. 1, 1883.

THE OLD AND NEW IN SHEEP HUSBANDRY.

Drawn and Engraved for the American Agriculturist.

Gate Hinges of Wood.

It is often convenient and economical, especially in newly settled regions where blacksmiths and hardware stores are not at hand to supply hinges for gates, to make them of wood. The simplest and most primitive form is shown in fig. 1. A post is selected having a large limb standing out at nearly right angles. A perpendicular hole in this

Fig. 1.

secures the top of the rear gate standard. The foot rests in a stout short post, set against the main post. A small gimlet hole should extend outward and downward from the lowest side or point in the hole in the short post, to act as a drain, or the water collecting in it would be likely to soon rot both the standard, and the short post itself. Another form is to hold the top by a strong wooden withe. A third form is illustrated in fig. 2, in which the

Fig. 2.

Fig. 3.

top of the standard passes through a short piece of sawed or split plank, spiked or pinned upon the top of the post. Figure 3 illustrates still another form, in which the top is held by a pin, having one end small enough to enter an auger hole near the top of the post, and keyed in on the opposite side. When loose or sagging, the pin-supporting piece can be easily driven in and keyed up farther.

Selecting Fowls for Eggs and for Market.

To make poultry profitable it is to be remembered that those breeds which lay the greater number of eggs during a single year do not produce the best chicks for market. Such fowls, though not deficient in quality, lack in size and hardness. For egg production, the Leghorns, Black Spanish, Hamburgs, Houdans and Polish, being non sitters, do not lose time in sitting, but require the same period for moulting as the other breeds, and they are not always to be relied upon for laying in winter unless under very favorable conditions. The Leghorns and Hamburgs come to early maturity, and begin laying when about five months old. Pullets of these breeds, when hatched as early as March, come into service by September, and as a rule pullets which commence laying early in autumn usually continue to do so throughout the winter. The Houdans are larger than the Leg-

horns, but are best for early spring laying, though when crossed on Cochins and Brahmas they produce pullets that equal any breed, not only as layers, mothers, and in size, but for market also. The Polish are too tender when young for farm fowls, but produce eggs abundantly when fully matured.

When eggs are chiefly desired, a different selection of certain breeds must be made than when raising fowls for sale in the market, whether as adults or chicks. It is best always to endeavor to combine egg production with quick growth and weight of carcass, when this can be done, and the cross mentioned between the Houdan and the larger breeds is a good one; but such fowls are crested, and therefore subject to roup in wet seasons, while the color of the legs is not a bright, clear yellow. The Plymouth Rock is one of the most popular for market, possessing yellow skin and legs, but this breed requires time for maturing, as do the Brahmas and Cochins, which brings the pullets in for laying rather late. They fatten easily and remain so on a small allowance of food, but the tendency of the Plymouth Rocks to take on fat quickly, sometimes causes the hens to be unprofitable as layers. There is much diversity of opinion regarding the merits of the Plymouth Rocks as egg-producers. The facts are that if a flock of Plymouth Rocks kept in confinement, are fed very judiciously, avoiding an excess of starchy material, the results will be satisfactory, but not so when they are too highly fed without the privilege of exercise. Allowed to roam at will, however, they do excellently, for they are good foragers and search over the ground industriously. Crossed on any kind of large coarse hens, the Plymouth Rocks produce chicks that grow rapidly and weigh heavily at any age, and their heavy feathering and yellow appearance of legs, beak and skin, add materially to their marketable value.

In raising fowls for market, liberal feeding is the first requisite, and confinement does no injury, provided the yards and quarters are kept clean. The earlier the chicks come in, the higher are the prices obtained, those weighing between one and two pounds being the more salable at first, but later in the season the weights should be in the neighborhood of two pounds, and larger still as the season further advances. As high as eighty cents per pound is sometimes obtained for prime early spring broilers, and from forty to fifty cents is not an unusual price for them when brought to market early, even when not of the best quality. The best breeds for producing market chicks are the Plymouth Rocks, Wyandottes, and Langshans. The last named possess the quality of fineness of grain in the flesh, but have dark legs. This fault is however compensated for by quickness of growth, and the pullets that may be kept over for laying have been known to begin nearly as soon as the Leghorns, which is a very desirable characteristic in a large breed, for the Langshans are nearly as large as the Brahmas. The Wyandottes are very plump and compact in body, and the chicks have a round, attractive appearance. Where the cocks are changed every year, and it is desired to combine egg production, weight, and quick growth, a good beginning may be made by using Cochin or Brahma hens with a Plymouth Rock cock, followed the next season with a cock of the Houdan breed. The third year a Langshan may be substituted, and then a Wyandotte. Entirely new blood from different breeds will thus be introduced annually, invigorating the flock and improving it in all respects, but only pure-bred males should be used. A dash of Brahma blood, now and then, keeps up the size, but too frequent use of Brahma cocks conduces to legginess of the growing chicks, though the adults may be compact. The crossing with a Plymouth Rock cock every alternate season would not do harm; for heavy weight of chicks smaller breeds should be avoided, as they transmit their qualities to their offspring very strongly. Those who breed chicks for market would do well to make use only of the special breeds for the purpose, as very often the profit expected may depend entirely upon such judicious management of the flock. First select well, and then feed well.

A Fence of "Stakes and Riders."

A very common method with the "worm" or "Virginia" rail fence is to drive slanting stakes over the corners, in saw-horse style, and lay the top rail into the upper angle thus formed. The stakes, resting on the under rails and standing at an angle, brace the fence firmly. But the feet of the stakes extending beyond the jagged corners formed by the ends of the rails, are objectionable. We have seen this remedied in part by putting the stakes over the middle of the panels—at considerable distance apart—and laying in them long poles horizontally. In this case the stakes should be set at such an angle as to prevent their moving sidewise along the top rail, which should be a strong one. These stakes and long riders are frequently used to raise the height of low stone walls. —Mr. Chas. H. Davis, of Warrenton, Va., sends a description and sketch of a fence nearly all composed of stakes and riders, which is used in that section. First, crotched stakes, formed by the forks of a branching tree limb, a foot or more long, are driven a foot or so into the ground at distances apart corresponding to the length of poles

A STAKE AND RIDER FENCE.

used. The bottom poles are laid into these, and two stakes, split or round poles, are driven over these and the next poles laid in. Then two more stakes and another pole, and so on as high as the fence is required. This will answer for larger animals, and be strong and not expensive. For swine, and other small live-stock, the crotch stakes would need to be very short, and the lower poles be somewhat small and begin close to the ground.

Barn-Yard Economy.

A dark stream, often of golden color, always of golden value, flows to waste from many an American barn-yard. This liquid fertility often enters the side ditch of the farm lane, sometimes of the highway, and empties into a brook, which removes it beyond the reach of plants that would greatly profit by it. Mice may gnaw a hole into the granary and daily abstract a small quantity of grain, or the skunks may reduce the profits of the poultry yards, but these leaks are small in comparison with that from the poorly constructed and ill-kept barn-yard. The most valuable part of manure is that which is very soluble, and unless it is retained by some absorbent, or kept from the drenching rains, it will be quickly out of reach. Manure is a manufactured product, and the success of all farm operations in the older States, depends upon the quantity and quality of this product. Other things being equal, the farmer who comes out in the spring with the largest amount of the best quality of manure, will be the one who finds farming pays the best. A barn-yard, whether on a side-hill or on a level, with all the rains free to fall upon the manure heap, should be so arranged as to lose none of the drainage. Side-hill barn-yards are common, because the barns thus located furnish a convenient cellar. A barrier of earth on the lower side of the yard can be quickly thrown up with a team and road-scraper, which will catch and hold the drenchings of the yard above, and the coarse, newly made manure will absorb the liquid and be benefited by

it. It would be better to have the manure made and kept under cover, always well protected from rains and melting snows. Only enough moisture should be present to keep it from fermenting too rapidly. An old farmer who let his manure take care of itself, once kept some of his sheep under cover and was greatly surprised at the increased value of the manure thus made. In fact, it was so "strong" that when scattered as thickly as the leached dung of the yard, it made a distinct belt of better grain in the field. The testimony was so much in favor of the stall-made manure, that this farmer is now keeping all his live stock under cover, and the farm is yielding larger crops and growing richer year by year. If it pays to stop any leak in the granary, it is all the more important to look well to the manure that furnishes the food, that feeds the plants, that grow the grain, that fills the grain bin. At this season the living mills are all grinding the hay and grain, and yielding the by-products of the manure heap. Much may be saved in spring work by letting this heap be as small as out-door yard feeding and the winds and rains can make it, but such saving is like that of the economic sportsman who went out with the idea of using as little powder and lead as possible. In farming, grow the largest possible crops, even though it takes a week or more of steady hard work to get the rich, heavy, well-prepared manure upon the fields. More than this, enrich the land by throwing every stream of fertility back upon the acres which have yielded it. Watch the manure heap as you would a mine of gold.

Farming Does Pay.

BY A NEW-ANGLED FARMER.

"Does Farming Pay?" is an old, dried-up question. As an honest farmer of my own school, I answer that it will, without doubt, where more attention is paid to the saving of time, which has a great value in the market. Too much time is allowed to be wasted in small lots; "every minute saved is two minutes earned"—please make a minute of it. Put your foot on it, and do not let a minute get away. Be always doing, or get your boys to do so.

Besides money, there is nothing like saving time. Since I first followed the plow when a boy (for fish worms) I have always made it my object to make the most out of every minute, and I can assure you that my style of farming has paid, from the fact that at my present time of life there are not more than one or two mortgages on my farm, and they could easily be removed by the money. In agricultural economy there is nothing like doing two things at once, and my most distant relatives and friends say that I am a humane, easy farmer, and I lay claim to being industrious. Now you know every farmer loses a great deal of time just in grinding his axes and knives. I have changed all this. By a slight contrivance on the other side of the grind-stone, I have attached a self-feeding straw-cutter; so when the boy turns the grind-stone, the straw-cutter goes at the same rate, and thus two objects are accomplished at the same time—if the boy does growl, and growling doesn't make it any easier, goodness knows. I can't see how it could.

In seeding time one of my boys goes into the field and scatters the grain broadcast with ease at the same time he pulls behind him a light harrow of my own construction, and the seed is harrowed in. Thus you readily see the expense of a drill and several horses is saved. I am trying to study out a plan for attaching a clod-roller behind the harrow to save the boy the time and the trouble of going over the field the second time, at which he might growl. Hoeing corn and potatoes is slow work; so I furnish my boys with handles that have two hoes on them, and of course they do double the work that one does, as you will allow; and in harvest my cradles have a back blade as well as a front one, so they cut backward as well as forward; and as the old wood-saw only cuts as it goes down through a stick, I have had one made for my boys

that also cuts coming back, and thus it saves half the time. When "agents" of any kind call on me, or even my neighbors, I invite them to the barn and get them to help me husk corn, while I listen to their talk; and you see I get a good deal of work done while I am getting a good deal of valuable information, and nobody loses any time—but them.

To assist the women-folks in their work and facilitate it, I have attached the churn to the washing-machine, and one girl can wash and churn at the same time, while another can be devoting her attention to something else equally necessary; and with the same end in view, I have attached the cradle for the twins to the sewing machine, so that my wife, who does most of the sewing for the family, can save the extra work of one of the girls tending the cradle, which would be pretty much all the time. Domestic economy is one of my most favorite studies, and without it no farmer can get along successfully. In cold weather, if one of my girls must have a hearth and a fire in the front room, I place a kettle of apple butter on the parlor stove, so that she can stir the apple butter and do her courting at the same time. I regret that several kettles have not turned out good this winter; I don't know why. When our relatives come out from town to visit us, it is kind of a relief to me to get them to assist me at something about the farm, as it seems to shorten my own work, and they generally work as long as they remain; but urgent business at home too often shortens their stay. You know that it generally takes one man to run a clover-huller, and one to run the fanning-mill. Now I philosophized, and found out that if I placed the two machines close together, and one of the boys between them with the left hand on one crank and the right hand on the other, both of them would go, and so I do not have to hire an extra hand. Many a farmer would never think of this, simple as it is; and it was with a great deal of hard study that even I arrived at it, and I had nothing but a good common school education either. I have shown our girls the efficacy of knitting while they are going to town in the wagon, and by this plan, so far, our family are all pretty well supplied with socks for the winter, and no time lost!

Another thing we have done without losing time this winter; the mud that the hands and ourselves have brought up to the house on our boots, without any trouble, has been used to fill up around the back porch, and you would hardly imagine how much has been done, and no extra work. For my own part, I cannot see why farming does not pay by my plan. I make it a rule also, to come away from town with more money than I leave in it, which again is in my favor; and while some farmers take the worst of their produce to market and foolishly eat the best, I would never do it, for I argue that town people want something good as well as anybody else, and will pay for it. We have, so far, managed to live on what we knew other people wouldn't pay for.

ABNER + APPLEBLOSSOM.
Witness, A. W. BELLAW. mark.

A Light, Strong Double-Tree.

Mr. F. Grundy sends us a sketch and brief description, suggesting an idea for so dividing the strain or leverage on a double-tree as to allow it to be much lighter than usual. In the ordinary double-tree each end is the long arm of a lever, its short arm being only half the width of the band

encircling the center, to which the draft ring or hook is attached. His idea is to substitute for the center band or ring, two iron rods, one a little distance on each side of the center; carry these back a foot or so, where they unite in a ring. From this ring and welded to it, an iron rod on each side extends to the end of the double-tree, passes through a groove sufficiently deep to hold it, and is turned in a hook in front to catch the ring in the center of

the whiffle-tree. The rod is held in its place at the end of the double-tree by an iron strap riveted over it. His idea is that the draft is thus distributed along the double-tree, or at least to four points on it. This plan properly adjusted would allow a much lighter timber to be used. The details for length and distance apart of the central rods, the mode of bringing the four rods together and forming the bar ring, etc., can probably be readily adjusted by a blacksmith.—As described, the arrangement will answer for occasional use, but for hard wear the angular rods would need a stronger attachment to the end of the double-tree than simply lying in a groove with an iron strap over it, and they would soon wear into the wood.

Cross-bars for Mangers and Troughs.

BY PICKET.

This device is intended as a convenient arrangement to prevent animals eating at mangers or troughs from throwing out the food, and yet allow these receptacles to be fully opened for cleaning,

MANGER BARS.

etc., which cannot be done if the cross-bars are fixed. A strong frame is made to fit the top of the manger, as seen in the engraving. It is hinged at the back so as to be turned up against the wall whenever desired, and is held down in front by a spring hasp. Cross-bars are run across from front to rear, just wide enough apart to allow the animal to clean the bottom of the manger. This width will depend upon its depth, and whether used for cattle, horses, or sheep. The same arrangement is convenient for hog-troughs, as cross-bars are essential not only to prevent their getting their feet into the trough, or throwing out food, but to give the smaller swine and pigs a chance for their due share. These, and in fact all other feed-troughs need frequent cleaning.

A Home-Made Chicken Brooder.

Many of the difficulties in raising young chicks, arise from improper ventilation. To secure pure air and warmth at the same time, has troubled many poultry breeders, not because of its impossibility, but on account of the large expense involved. The recommendations to use sheep skins for the young chicks to nestle under, or water tanks for them to retire under for warmth, are not bad ideas, but recent experiments have demonstrated that they are freer from disease, thrive better, and are less liable to danger from overcrowding, when surrounded by a constant current of pure air. A cheap apparatus for warming a brooder may be made with a coil of a few feet of half-inch lead-pipe. Thin pipe is best, as it is more quickly heated, is not soon injured by water, is comparatively secure from leaks, and is cheap. One end of the coil is lower than the other, that cold air may enter it in making the circuits of the coil, and it becomes warmer by the time it emerges from the higher end. The coil is set in a small boiler filled with water, and placed on an ordinary, single-burner, coal-oil stove, taking care to have the ends of the coil free from obstruction. Make a box large enough to accommodate the desired number of chicks, of any preferred form, and attach a rubber tube to the coil, and conduct the heated air into the brooder through the top, thus bringing it directly over and upon the chicks, and crowding down all impurities by forcing the cold air out at the openings for egress and ingress of the chicks. The cold air, being entirely pure when it enters the coil, is heated as

it passes on, and rubber being a non-conductor of heat, little of it escapes after the air enters the brooder. Observe that if the coil at its free end is not lower than at its entrance into the brooder, warm air would pass the other way, and cool instead of warm the coops. Such a brooder can be constructed cheaply, and if a large boiler be used to furnish the heat, the number of coils can be increased to warm several brooders at once.

Poultry House—Cost \$43.96.

SECOND PRIZE: BY H. A. KUHN, ATLANTA, GA.

My Poultry House is used for keeping twenty-five to thirty grown fowls. For breeding I run a parti-

Fig. 1.—EXTERIOR OF POULTRY HOUSE.

tion through the center and keep eight to fifteen in each apartment, according to the breed. In this latitude it is seldom so cold that they cannot remain in the open air some part of the day. In cold windy weather they only run in the front yard, where they keep quite comfortable, as it is closely planked on all sides except on the south, which has lattice or woven wire.—The structure is sixteen feet square, facing the south. No posts are used. Seantling cut of proper length are laid on the ground in shape. A couple of planks are nailed on each end and raised into position when the longer or side seantlings are set in place. The planks or boards are then all nailed on, and the rafters are next added. These are notched to fit over both the seantling or plate, and the outside plank. This house was built of all heart yellow pine, and required about two hundred and fifty feet of seantling and twelve hundred feet of plank. It was built in two day's time by two men at one dollar and seventy-five cents per day wages, or seven dollars for the work. The windows swing open as in fig. 1. By adding another room this house would hold fifty fowls. Figs. 2 and 3 show the interior.

MATERIALS AND COST.—Of one inch thick boards: 1,000 feet one foot wide for sides, roof, nests, etc.; 12 base boards, 6 inches wide and 16 feet long; 10 boards, 3 inches wide and 16 feet

Fig. 2.—PLAN OF POULTRY HOUSE.

long for boxes and roof strips, etc.; 6 boards, 4 inches wide and 16 feet long, for window easings; 7 seantlings, 2 by 4 inches, 18 feet long; 17 pieces seantlings, 2 by 3 inches, 16 feet long, for studs, etc.; 4 windows, 4 by 5 feet, costing two dollars

and a half each; one door, 3 by 7 feet, costing two dollars. Labor and nails, ten dollars. The total cost is forty-three dollars and ninety-six cents.

Prairie Tree Planting—A Suggestion.

Along most of the streams, large and small, in Kansas and Nebraska, are patches of a rich black loam which bear no grass, but are covered during the growing season with a dense mass of weeds. These places are flooded in high water, and are usually difficult to cultivate satisfactorily. It is not generally known that such places can be turned into timber plantations with no expense except planting the trees, and keeping the fire out afterwards. Select seedling trees from three to five feet high, and plant them four to six feet apart. They should be so large as not to be too deeply overshadowed by weeds the first year; but they will hold their own and come out right, even when not half as high as the tallest weeds. Such land has no stiff sod, and but little grass. If they have been deeply flooded the first season, when the water subsides see that they have not been covered by drift, either earth or dry weeds. The kinds of trees most suitable for this are: Box Elder, Ash, Elm, Cottonwood, Soft Maple, and Catalpa. Walnuts would thrive, but it is sometimes difficult to transplant them. It is said that nuts planted in such places will grow and do well, but the writer has had no experience with them; the other trees above mentioned, he has tried successfully.

Indian Corn—Its Value in the Ration.

Some English writers seem disposed to deery maize as being very poor food for beasts and poultry. There is danger of their leading their follow-

Fig. 3.—SECTIONAL VIEW OF POULTRY HOUSE.

ers to lose the advantage of a most excellent and cheap article as a portion of a complete ration. Indian corn is not only valuable food for horses, cattle, sheep, swine and poultry, but for man, and the writer sincerely hopes the time may never come when it shall not form an important portion of his own daily bread. The fact is, Americans do not eat enough corn for their own good, and eat far too much fine wheat flour in one form or another.

Corn is so rich in oil that we may say corn-bread is ready buttered; it is, however, very digestible, and in cold weather this oiliness is a most valuable factor, as it serves to keep up the heat of the body more directly than starch and similar substances.—With oats and barley it may form one-third of the grain ration of hard worked draft horses, and will keep their coats glossy and be in every way a benefit, certainly worth more than its weight in oats. Fed alone or in larger proportion, it has a tendency to make horses sweat easily, and, it is said, to become quickly exhausted. It is not safe to feed it as freely as oats or barley, as there is danger of impaction and colic—just as there would be if wheat were so fed. No doubt it is best fed ground with oats, and the proportions already indicated are probably the most satisfactory, the meal being fed upon cut hay.

For cows in milk, corn meal may form with bran the exclusive grain ration, and may be fed at the rate of one pint of corn meal to each hundred

pounds of the cow's live weight. No doubt it will be found just as good in Great Britain as here. It gives quality and richness to the milk, color to the butter, and abundance to the flow if the cow is a good one; but if she is inclined to lay on fat, such feeding will cause her to fatten, even though in full milk, and if she gets too fat she will go dry.

For sheep, corn is excellent, but should be fed whole and a little at a time. For swine, the universal experience from Maine to Oregon, and from Canada to Mexico, is that it will make more and better pork than any other food. For poultry, it is in this country the universal grain, but is not always the best. It is admirable for its fattening properties, but for laying hens, and growing fowls, it is not well to use too much. "Corn fed" fowls, ducks and geese are firm fleshed and yet tender. They bear transportation alive with little shrinkage. True yellow corn makes yellow butter and yellow fat in fowls. English and French taste demands white fleshed poultry with pale lard fat, and so they fatten poultry on rice, and their fancy market fowls have about as much flavor as boiled rice. The American market demands yellow-fleshed fowls, with fat as yellow as June butter, and corn is the food to produce this in all poultry.

What are Bacteria?

The newspapers have recently reported that cholera and some other diseases have been found to be due to "Bacteria;" and also that epidemics among sheep and fatal diseases among cattle are caused by "Bacteria." The authors of these accounts seem to think that when they have given a name to the alleged cause their duty is discharged, but those who read ask: "What are Bacteria?" The dictionaries give no help in answering this query, and some of our readers appeal to the *American Agriculturist*. *Bacteria* is the plural of *Bacterium*, a name given to a very low form of plant life, which is never seen except with the microscope, as they are only one-twenty-thousandth of an inch in diameter. The engraving shows the appearance presented by the different forms as seen under the microscope. A single *bacterium* is shown at *c*. A number are most commonly joined end to end, as in *a* and *b*, to form rod-like bodies. They get their name from this peculiarity; the Greek name for a rod or a cane, is *bactrys*, and thus these rod-like forms of microscopic life were named *Bacteria*. Wherever fermentation or decay is going on, vast numbers of *bacteria* are found. It is now known that yeast causes fermentation because it mainly consists of minute microscopic plants, somewhat like *bacteria*. These minute yeast-plants, when growing in liquids containing starch, sugar and other matters, cause them to undergo the changes known as fermentation. It is now claimed that *bacteria* within the bodies of ani-

BACTERIA, HIGHLY MAGNIFIED.

mals, including man, in making their growth produce changes similar to those of fermentation, and cause diseases. The spores of *bacteria*, or reproductive bodies answering to the seeds of flowering plants, are carried about in great numbers in the air.

Those who have forced Hyacinths and other "Dutch Bulbs" in pots, often throw them away, under the impression that they are not worth further trouble. If, after the faded flowers are cut away, the bulbs are kept watered so long as the leaves remain green and healthy, the bulbs may do good service yet. When the foliage begins to turn yellow, withhold water from the pots, and when the

leaves are faded, cut them away and place the pots in the cellar. Next spring the bulbs may be planted out in the garden, where they will continue to flower for years—not so finely as at first, but the flowers will be very useful for cutting, and well worth the room they occupy in the flower garden.

A Window Conservatory.

Those who cultivate plants in windows, often wish to increase the available space. This may be secured by constructing a conservatory like that shown in the engraving, the sketch for which was sent us by Mr. M. R. Thompson of this city. A pro-

jecting frame is built out from the window, the front of which consists of a sash, so arranged that it may be pushed down for ventilation, to the point shown by the dotted lines. The sides are inclosed in proper sashes. This arrangement allows a fuller exposure to light than can possibly be had in an ordinary window, and will give satisfaction out of proportion to its cost.

Flower Forcing in the Window.

Those who have no green-houses, but whose plant culture in winter is confined to a sunny window, may enjoy a few flowers without even the trouble of growing them, if they are fortunate enough to find one of our common evergreen shrubs, the Leather-leaf. This is usually one to two feet high, with its branches terminated by one-sided clusters of flower buds that are very much advanced in autumn. It is common in bogs and swampy places in all the Northern States, as far west as Wisconsin, as cranberry cultivators know to their cost, it being a most troublesome plant or weed in their plantations. Many winters ago we gathered a cluster of these flowering stems, being attracted by their beauty even in their undeveloped state. These were placed in water, in a window, and to our great surprise the buds gradually increased in size, and at length were in as fine flower as if they had been left on the bushes until spring. These are so neat and pleasing, and the flowers last so long, that the plants are worth searching for. Besides the name above given, the plant is in some localities called "Feather-leaf" and "Gander-bush;" its botanical name is *Cassandra calyculata*. Our success with this, suggested trying the "Trailing Arbutus," or "May-flower" (*Epigaea repens*). This in a warm room was an utter failure, but a clump of it laid in a shallow dish, supplied with water as needed, and kept in a room where there was no fire, opened its charming fragrant flowers quite satisfactorily. We have no doubt that the Partridge-berry (*Mitchella*) would succeed with similar treatment. A shrub from Japan (*Forsythia viridissima*), often called "Golden Bell," is one of the earliest of all the spring-blooming shrubs, and is now quite common in cultivation. The ends of the slender stems of this, if cut any time during the

winter and placed in water in a warm room, will soon hang out its golden bells, and give a lively bit of color and a foretaste of spring. Among the willows, the European "Sallow" or "Goat-Willow" (*Salix Caprea*) is frequently cultivated. The staminate or sterile tree has very large and showy catkins, which are produced early in spring, and in the north of Europe the twigs are used on Palm Sunday as a substitute for real palms. If twigs of this are placed in water, the catkins will soon bloom in a sitting-room. Some of our own willows will probably flower if treated in the same manner, especially a very common one, known to boys as "Pussy Willow" (*Salix discolor*). The forcing of plants in this manner offers a field for experiment for those interested in such matters, and it is probable that the list of those available for inexpensive home decoration may be much enlarged.

Forwarding Plants.

Mr. S. J. Andrews, Clinton, Ont., sends us a sketch and description of his mode of starting plants early, protecting the roots from grubs and insects, and giving them a good send-off. Pieces of pasteboard, three by six inches, are bent together in the form of a square box or tube, (fig. 1,) three inches long and an inch and a half in diameter, the two ends of the piece simply coming together at one corner of the tube. A box (fig. 2,) one foot deep and of any size desired, is half filled at the bottom with half-rotted manure. Upon this the pasteboard boxes are set in closely together and nearly filled with rich loam, on the top of which two to four seeds of cabbage, tomato, etc., are dropped in each tube. Over the whole is then scattered a quarter inch deep, a mixture of loam, ashes and poultry droppings. Mr. A. says: "Thus arranged with the aid of the slight bottom heat, the plants came up very quickly and made a vigorous growth. When a few inches high, I removed all but one plant to a tube, and taking off the side of the box the tubes, plants and soil were easily removed to the open ground, and planted without the slightest disturbance of the roots. These plants, alongside of others set out in the usual manner, showed all summer a marked difference in size and growth, and in autumn a much larger crop. I claim for the tubes cheapness in material and construction, no disturbance of roots in transplanting out, protection from worms, grubs, etc., while the roots are small and tender; and that the fertilized earth in the tubes give them efficient help when the young roots most need aid to take hold of the soil when set out. The soil in the box and tubes would need to be kept moist enough by sprinkling with milk-warm water, or supplying it from below.

These tubes, if of strong pasteboard, can be kept for use the next season. A box, a single foot square, would hold sixty-four of the tubes for as many plants; a box two feet square would hold two hundred and fifty-six. Any second-hand boxes of various sizes can be used, and the only cost will be for the pasteboard. This can be pro-

Fig. 1.

Fig. 2.—BOX OF BOXES FOR PLANTS.

cured and the tubes and the boxes made ready in any number during these leisure winter months.

HARD ON THE NAMES.—We thought, when one of our Broadway fruit stands exhibited the sign "Dan Joe Pears" (d'Ajou), that horticultural nomenclature had a hard strain, but the "Gardener's Chronicle" (Eng.) gives us some still more striking per-

versions. A Covent Garden market-man has that beautiful climber, *Stephanotis*, as "Stiffer Notice" (he must be an advertising agent). But worse yet was a label from a gentlemen's greenhouse that read, "Rinkum sperum, Jesse Mindes," which, when translated, stood for *Rhynchospermum jasminoides*.

Home-Made Sashes for Hot-Beds.

Sashes for hot-beds, cold-frames, and green-houses are manufactured at nearly all sash-factories, but it frequently happens that these factories are located many miles from the gardener who wants the sashes. If they are ordered through the local lumber merchant, his profit and the freight charges will make them rather expensive. While factory-made sashes are desirable, they are not indispensable. We give below an engraving which shows how a home-made sash, for hot-beds, etc., that has the merit of cheapness, is constructed.

The frame is of inch-and-a-half pine. The end pieces three inches, and the side pieces two inches wide. The cross-bar under the center is one inch

FORM OF THE SASH.

square. The sash contains sixteen panes of eight by ten glass, which is a useful size. The bars of the sash are each composed of two laths—one divided lengthwise, and one whole. The divided lath is fastened to each side of the whole one, and forms the ledges upon which the glass rests. When set in, the glass is lapped about a quarter of an inch, so that it will shed rain. Sashes thus constructed have been in use several years, and given as good satisfaction as those obtained from the sash-factories, though they did not cost one-fourth as much.

A New Potato.

Our cultivated potatoes are derived from *Solanum tuberosum*, and we have new varieties of these by the dozens every year. The European journals now announce an entirely new species of *Solanum* with edible tubers, *Solanum Ohroudi*, so named from the person who discovered it on an uninhabited island at the mouth of the river La Plata in South America. This new potato has been tried at Brest, in the north of France, and appears to have qualities which may be of value when it has been improved by careful culture. Among others, it promises to be hardy, and when once established, it remains in the soil from year to year. It remains to be seen if this is a desirable property. Think of a potato becoming a weed, and forcing its tubers upon us whether we wish them or not! The dwarf habit of the vine, not exceeding a foot in height, its freedom from disease, and its hardiness, all make it worthy of being thoroughly tested. On the other hand, the difficulty of rooting it out where once planted will make our planters cautious of it, should it be introduced among us.

The Chick-Pea.—“Coffee Plant.”

The Chick-pea (*Cicer arietinum*), one of the oldest of cultivated plants, every now and then is sent us to know what it is, or by some one who has received it as the “coffee-plant,” to know its value as a substitute for coffee. The Chick-pea was hardly known in this country until about twenty years ago, when some enterprising person advertised it as the “coffee-plant,” and advised every one to grow his own coffee. The Chick-pea is related to the common pea, and like that, is an annual.

THE CHICK-PEA (*Cicer arietinum*).

It grows about a foot and a half high, and is covered with fine hairs. The engraving of a small branch shows the shape of the leaves and the small pods, which contain one, or at most, two seeds. These are rather larger than common peas; they are so strongly wrinkled that they have been compared to ram's heads. This has given the plant its specific name, *arietinum*. The Chick-pea is cultivated in all warm countries. In India it is sold as a food for horses under the name of “gram.” It is cultivated in Mexico, where as “garabanza,” the Spanish name, it is esteemed as a luxury. We have eaten it there and found it a very coarse food, far inferior to the *frijoles*, or beans of the country. The reputation of the Chick-pea as a substitute for coffee has not yet died out, and we are often asked about it. There is no substitute for coffee. It is either coffee or no coffee. Still, for a warm, colored drink, Chick-pea is just as good as roasted rye, brown-bread crumbs, or parched Indian corn—and no better. Any starchy grain, when roasted, will give a colored infusion, but it is not coffee. As the Chick-pea belongs to a warm country, and its yield is small, it is not likely to gain a prominent place among our crops for “coffee” or other purpose.

Raisin Making in California.

Mr. George Husmann, so long identified with grape culture in Missouri, a few years ago removed to California, where he manages a large vineyard. In preparing a revised edition of his “Grape-Growing and Wine-Making,” he has given several chapters upon grape-growing and wine-making in California, which add materially to the size of the work, and essentially increases its value. Very few are aware of the vast proportions the making of raisins has assumed in California. Some persons have several hundred acres in vines, the fruit of which is converted into raisins, and many more vineyards planted for the same purpose, will soon come into bearing. The following extracts from the chapter on “Raisin-making,” will give an idea of the manner of carrying on this important industry:

Raisins are made from the Muscatella, Gordo

Blanco, and Muscat of Alexandria, preferably of the former; also a seedless raisin, highly esteemed, is made from the seedless Sultana. The grapes should be allowed to remain on the vine until quite ripe, and show a yellowish or golden color, and are more translucent than when too green. Then they should be carefully picked and placed upon a drying tray (usually two by three feet in size), and exposed, with an inclination toward the sun, in some convenient place, generally between the rows in the vineyard, or in some contiguous open land. After having been exposed a sufficient time to become about half dried, they are turned once in this manner, viz: two workmen taking an empty tray, place it upon a full one, holding them firmly together, and with a swinging motion turn them over, and replace the now turned grapes in their former position. The turning should be done before the dew is quite off of the grapes in the early morning; then, when the grapes have become so dry as to lose their ashy appearance, some being a little too green and some quite dry enough, they are, after removing those entirely too green, slid from the tray into large sweating boxes, having a thick sheet of paper between about every twenty-five or thirty pounds of raisins; then removed to the store-room, where they should remain two weeks or more. When ready to pack, it will be found that the too moist ones have parted with their surplus moisture, which has been absorbed by the stems and drier raisins. The stems are now tough and the raisins soft and ready to pack. They are carefully placed in packing frames made of iron or steel. The large and fair ones being placed carefully in the bottom of the frames, the surplus stems and imperfect berries cut away, then the average raisins are arranged in and weighed, placing five pounds in each frame, pressed enough to make them firm in the frame, but not enough to break the skin. They are then transferred to the packing-boxes by the aid of the movable bottom to the frame.

The complaint is sometimes made that the California raisins have tough skins, too large and too many seeds, lose flavor in cooking, lose their bloom, and do not keep well. The most of these objections arise from an imperfect knowledge of the best varieties from which to make them. If Californians would confine themselves to varieties which centuries of experience have proved to be best in Europe, there would be more satisfaction in the result. Cultivation, irrigation, local climate, kind of soil, and exposure to the sun, all have an influence in modifying the characteristics of any one variety. Virgin soil and vigor of vine may make the seeds fuller, as it does in the cereals, but it should not, other things

being equal, make skins thicker, but the contrary.

As a soil for raisins, a rich, sandy loam is preferred; the climate should be warm; the soil moist; winter irrigation in average years is quite as important as summer in our dry valleys. For safety against many kinds of insect pests, the phylloxera especially, a location is desirable where water is plenty and evenness of land surface permits winter submersion. In such favorable locations a larger berry, thinner skin, better yield, etc., will be the result. The vines are planted eight by eight feet in many locations, but growers of the greatest experience prefer a greater distance apart; some plant eight feet by ten feet, some ten by ten feet, thus giving greater vigor to each vine, enabling it to resist enemies of all kinds much more surely.

An Almost Forgotten Fruit—The Apricot.

One need not be very old to recollect when the apricot was a common fruit, and, in its season, abundant even in small places. Some thirty years ago the Apricot grew less common, and is now so rare that when occasionally offered in the City fruit stores it arrests attention, and many even ask the name of the strange fruit. Indeed the few offered come chiefly from California, and bring a very high price. The cause of this disappearance of the apricot in the older States, is not due to any conditions of climate, but to the prevalence of the euireulio, which has so interfered with the cultivation of the plum. Means were at once taken to save the plums, but it was not known that the same insect was destroying the apricot, and the remedy was not applied. Now that we can have plums in spite of the “Little Turk,” the apricot should be restored to its former place among our fruits. The apricot was formerly placed in a distinct genus (*Armeniaca*), but botanists now include the plum, cherry, peach, and apricot, in one large genus, *Prunus*, and the apricot is named *Prunus Armeniaca*. The present specific, and the former generic name, both indicate that Armenia was thought to be the native country of the apricot. Recent travellers have failed to find any evidence that the tree is indigenous to that country. In the latest work on the origin of cultivated plants (Decandolle, *L'origine des Plantes Cultivées*), the author finds that the weight of evidence is in favor of China as the original home of the apricot. While the fruit is men-

THE APRICOT.

tioned by the early Greek and Roman writers, the records of China, some three thousand years before the Christian era, show that the fruit was known to the ecclesiastics at that early period. The apricot forms a small tree, not over twenty feet high, and is readily distinguished from the related peach, plum, etc., by its large, glossy, heart-shaped leaves. These are shown in the engraving, and also the general appearance of the fruit. It is the earliest of all fruit trees to flower, and on this account its fruiting is sometimes prevented by late spring frosts. In bloom it is very showy; its flowers, either pure white or tinted like those of the peach, are in great abundance. The fruit varies from an inch and a half to two and a half inches in diameter, with the general aspect of the peach, and

like it, usually has a more or less distinct "suture" on one side. It differs greatly from the peach in its stone, which is quite smooth, like that of the plum. The skin is downy, much more so in some varieties than in others. Having been so long in cultivation, many varieties have been produced, in some of which the flesh adheres to the stone, and in others is free; as in the almond, the kernel is sweet or bitter in different varieties. The flesh of the apricot is much like the peach in texture, but very unlike it in flavor. Coming in just after cherries and before early peaches, the apricot is very acceptable. It is valued not only for the dessert, but for canning, drying, etc., and it should be restored to its place among our popular fruits. If the same method was followed as with the plum—a systematic daily jarring of the trees, and catching the curculios on a cloth, the fruit may be again abundant. In the nurseries the apricot is budded upon the seedling apricots, and also on plum, peach and almond stocks. The plum is best for this, especially for planting in heavy soils. By shortening in the yearly growth as with the peach, the apricot will form a compact head, and be more fruitful. The tree is sometimes trained against walls and buildings. When this is done, it should be on the side least exposed to the sun. Our best nurseries offer twenty or more varieties. For a small garden, Downing recommends "Large Early," "Breda," the "Peach Apricot," and "Moorpark." For a cold climate, he selects "Red Masculine," "Roman," and "Breda." Let us have apricots.

The Sweet Gum Tree.

We trust that the recently awakened interest in forestry—the planting of trees to grow timber—will also call attention to the value of our native trees for ornamental purposes. If one who wishes to plant them to beautify his grounds consults a nursery catalogue, he finds that the greater share of the trees now offered are of foreign origin, while our most ornamental native trees are difficult to procure. Among the most desirable trees for ornamental purposes, is the Sweet Gum (*Liquidambar styraciflua*), and in New York and New Jersey, is often called Bilsted. This tree is found west-

Fig. 1.—FLOWERS AND FRUIT OF SWEET GUM.

ward to Illinois, and southward to Texas and Mexico. It forms a large tree, sixty feet or more high, and two or three feet in diameter. The old trees have a deeply furrowed bark, similar to that of some oaks. Its young branches are winged with wide longitudinal ridges of a corky growth. The leaves are rounded in their general outline, but

deeply divided into five and sometimes seven pointed lobes, which give them a striking, star-like appearance; they are of a dark-green color and a firm texture. In autumn they assume a deep purplish red, and are so showy, that the tree is worth

Fig. 2.—A YOUNG SWEET GUM TREE.

planting for the beauty of its autumn foliage. The flowers of the Sweet Gum are of two kinds, both very small. The staminate or male flowers are in small conical clusters which soon fall. The pistillate, or fertile flowers, are in globular clusters, which ripen into a spherical head, made up of beaked capsules which open to let out the small seeds. Figure 1 shows the ripe fruit and the pistillate flowers, and figure 2 gives the port of the tree when young. Both its generic name, *Liquidambar*, and its specific name, *styraciflua*, have reference to a quality only manifested in warm countries. In Louisiana and in Mexico it has exuded, when wounded, a sort of balsam like *Styrax*, which is deficient in the tree grown in the Northern States. As a timber tree, the Sweet Gum does not hold a high rank. Its wood is compact and fine-grained, it has a pleasing reddish color, and takes a fine polish. It is only of value for inside work, as it is very perishable when exposed. The tree cannot be recommended for economical planting, as we have so many better kinds, but as an ornamental tree, it is one of the finest, and in making a select collection of trees, this should not be over-looked.

A Change in the Color of Indian Corn.

Mr. Edward B. Bates, Worcester Co., Md., communicates the following experience: "I have always considered yellow to be the original color of Indian corn. In 1882, my white corn, from clean seed with no chance of mixture, gave me about two ears of red corn in every fifty bushels, and this was remarkably even in its distribution in the field. In 1883, I took the best of this red corn and planted fourteen rows, two hundred and thirty-seven hills in length. These were immediately between pure white and pure yellow varieties, the white was on the west and north, that being the direction from which all mixing or crossing comes in this locality. When the corn was husked the red corn had nearly all become yellow. According to the usual mode of crossing here, if any change occurred it should have been to white; not more than a hundred hills produced red corn, and that quite scattered. In my white corn there was not a single red ear." Mr. B.'s inference from this occurrence is, that "the original color of corn is yellow, and that white is a sport caused and established by cultivation. That the red is an intermediate step in returning to the original color. In selecting the red corn of 1882, I only eliminated all that was inclined to revert to the original color—What does the *American Agriculturist* think of it?"

As Indian corn is not known in the wild state we have no means of knowing the original color.

Bonafous, in his work "The Natural History of Maize," states that he has had the colored kinds keep true for ten consecutive years, and mentions a white kind that had been cultivated for more than a century without change. In a plant that has proved itself so variable as corn, and has been cultivated so long under many opportunities for crossing to occur, such variations are to be expected. Mr. B. asks the question: "Does not yellow corn cross more readily and affect more strongly the white, than the white does the yellow?" This is a question upon which we should like evidence.

The Maiden-Hair Fern.

A lady writes us that while she succeeds with other ferns in her fern-case, all her attempts at growing the most graceful of our native ferns—the Maiden-hair—have failed, and she asks how to succeed with it. Fern-cases are expected to be at their best in winter. In order to have them showy at this season, the ferns must be evergreen species, either native or foreign. Many of our native ferns appear in spring, make their growth, and die down at the end of the season. The Maiden-hair is one of these. If it is taken up in summer and planted in the fern-case, it will die down as winter approaches, and there is no help for it. The Maiden-hair fern can best be cultivated in an outdoor fernery. A lot of stones, with earth from the woods among them, in a shaded place, will allow lovers of ferns to grow them with very little trouble. In making a rock-work like this, take care that all the pockets of woods earth connect with the soil below, else they will dry out. The Maiden-hair fern is quite common in rich, moist woods, as far south as North Carolina. Its frond, at the top of a slender, black, polished stalk, is handsomely divided, with its divisions of a pale green color. Our species is *Adiantum pedatum*. The generic name, *Adiantum*, is from the Greek, meaning unwetted, as the fronds repel rain-drops. An allied European species has long been used in France to make a syrup called *capillaire*, much used for coughs, etc. Our species will answer the

THE MAIDEN-HAIR FERN.

same purpose. It yields to boiling water considerable mucilage and a bitter principle. The genus *Adiantum* is a large one; some of its species from tropical countries are among the most beautiful ornaments of our hot-houses. Some of the exotic species are much larger than ours, and, being perennial, may be grown with success,

A Corner Bracket.

A large bracket, fastened to the wall in a corner in such a manner that it is capable of supporting considerable weight, is very useful and answers many purposes of a small stand. As supports, screw firmly to the wall two narrow pieces of board, an inch thick, at any desired height; two and a half feet from the floor, or the height of an ordinary stand, is convenient. The shelf may project twelve

A CORNER BRACKET.

to eighteen inches from the inner corner, with rounded front. The cover may be of any material preferred. Cut one piece for the top and a straight piece, ten to twelve inches deep, according to the size of the bracket, and long enough to go around its front. Trim this piece with a band of a contrasting color about two and a half inches wide; finish the lower edge with fringe, and seam the two pieces together. Cut the cover for the top two inches larger than the board, so that it can be drawn down over the edge and tacked on the wrong side. To prevent its tipping by any weight, fasten to the wall with a small piece of leather or strong muslin, under the inside corner of the top. Dark-red felt, with a band of deep-gray or brown plush, makes a pretty cover. The good part of a worn-out coat can often be used. Many kinds of gray or brown cloth are very good on the wrong side, after the right side is quite worn and faded, and by cleaning and pressing it may be made to look almost as well as new cloth. A band of embroidered canvas may be used in place of the plush, or some pattern may be worked directly on the stuff. If in a bedroom where there are window curtains of chintz, the bracket may be covered to match, leaving off the band around the front and finishing off the lower edge with fringe, or a plaiting of the chintz. MRS. BUSYHAND.

House-Furnishing.

A lady of limited means, but of rare taste, whose touch molded almost everything into something beautiful, and whose success in all practical matters pertaining to every-day home life made her an oracle to the young and inexperienced, recently said: "I have never coveted any lady's jewels, silks, and laces, or even her position in 'society,' but I am afraid I have sadly broken the Tenth Commandment when I have seen the beautiful, well-ordered homes of some of my friends, where every department seemed complete and filled with all that could be desired for health, comfort and beauty." There are thousands of ladies with the same longings, and who, if they have an extra five

dollars, would much rather spend it for home decoration than on dress for themselves. It is possible with limited income to make a very modest home more attractive than a much richer one, and its influence on the family, especially upon children, cannot be estimated. Such a home does more to form the character for good, than the teachings or discipline of parents. We would like occasionally to help those trying to make pleasant, cheery homes, who have not the means to employ a professional decorator, but whose own heads and hands must design and do all. For these comforts we would say: A home where the furnishing of each room has been thought out and perhaps worked out by mother and daughters, has a value to father and sons far beyond one committed to some stranger to "furnish throughout as stylish as possible," at any cost. Its influence does not cease when it is broken up, but reaches down through generations in other homes.

Harmony of color is of the first importance in furnishing. Not that walls, carpet, curtains, chairs, etc., should be of the same color; that would make a room cold and uninviting. There should be two or three colors in a room, but these should harmonize. If one is conscious that she has no eye for color, she should consult some one of known taste before purchasing articles which, although by themselves might be desirable, would perhaps if placed with others spoil the effect of the whole, and be a disappointment to be endured for years. A carpet for instance should not be purchased without considering what the color of the paint is; and so of the sofa and chairs, if they are upholstered. A carpet is like the background of a picture, it brings into effect the whole. Styles for carpets have entirely changed within a few years. Patterns of huge bouquets of impossible flowers used to be seen almost everywhere; now a very small, set figure, so small as to look almost like a plain color at a little distance, is in much better taste. This may be enlivened by a border of bright colors. The lovely pearl and gray grounds, with vines or tracery of a darker shade, and bright borders of Persian patterns, are very desirable, and look well with almost everything. The fashion of staining floors black-walnut color for a yard or more around the walls, and having a square of bordered carpet in the centre, is gaining ground, and much liked for the pretty style and the convenience of taking it up for cleaning. It is also economical. There are now plain, ingrain carpetings, in solid colors, called "filling," which are used around these center rugs, instead of staining the floor. We have seen parlors carpeted with dark, turquoise-blue filling, with Persian rugs over them, not in any set or regular order. The effect was very good.

Curtains are a very important part of furnishing. Of course there must be shades. There ought to be drapery, however simple; no one thing adds more to the pleasant, cheery look of a room. Shades are now rarely white, but tinted, either gray, cream, or old-gold color. They should never be of a very deep shade. Many use red for the dining-room, but that color is better suited to some public place. A fringe about two and one-half inches wide finishes the bottom. For drapery there are many beautiful and artistic patterns in Nottingham lace, which is low-priced and durable. They may be selected to look so like real lace that they can hardly be distinguished from it. The yellowish tint should be chosen, and in light patterns. Linen serim, with inserting and edging of guipure lace, is always handsome. Simple cheese cloth, plain or figured muslin, or cretonne, are all pretty. Heavy fabrics should be used only in large and richly furnished rooms. They may be used with good effect for portieres, to hide or replace a door, or to separate rooms. Heavy lambrequins are not in style. Curtains are hung with rings on poles of brass or wood, and the lambrequin, if any, is straight across, narrow or broad, embroidered, or trimmed with fringe, or it may be a simple plaiting. Mantel lambrequins are a plain scarf across the front, with decorated ends hanging low. There is often, as a back ground for ornaments above the mantel, a curtain, plain or plaited, of the material

of the lambrequin, about half a yard wide, hung upon a rod with rings. This may be of velvet paper, beaded by a narrow gilt molding. Halls are no longer the barren entrances to the home, but are a part of it. Old and quaint chairs look well here, and if there is a window, a drapery curtain with a large plant on a small stand, is very pretty. An ornamental umbrella stand is often seen in halls, instead of the old heavy marble-top stand. We will go farther into the home at some future time. ETHEL STONE.

Drop-leaf Tables.

Tables of a single leaf hinged to the wall are very convenient, and should be in much more general use. They are useful in almost any room in the house, and can be of any desired size. A simple small desk, for a dictionary or other reference book, a writing or study desk, a temporary shelf for plants, a kitchen table, etc., may each be constructed in this manner, and be of the breadth and length required for the use for which they are designed, or that the space will allow. When not in use, they can be dropped down or turned up against the wall, or be so arranged as to be removed entirely. A correspondent sends the sketch of one in his own kitchen, made thus: "A double-beaded strip, about three inches wide, an inch

A CONVENIENT WALL TABLE.

thick, and about three and a half feet long, is firmly attached to the wall, about thirty inches above the floor. A drop-leaf eighteen inches wide is strongly hinged to this, and supported by a swinging leg, or by side chains, indicated by the dark lines. The chains are more secure and reliable. When not in use, it is raised and held against the wall by a button. Neatly made, it is not unsightly, and is very useful in baking, washing dishes, etc.—Unless very strong, it would hardly be firm enough for such heavy work. We have used such a table supported by stout iron wire for a long time.

A Home-made Lounge.

Many things can be made for the kitchen at little expense, which will add greatly to its comfort and attractiveness. A lounge is almost as restful to a weary woman as a rocking chair, and may well be in every kitchen large enough to hold one. Here is one which serves not only as a lounge, but as a repository for many things required in the house-

A CHEAP LOUNGE.

hold. It was, to begin with, a box six feet long, about two feet wide, and fourteen inches high, as, to be comfortable, it should be low and wide. To the top a cover was fitted, hung with hinges at the back. Four easers were added to the corners. For a covering, a pretty, cheerful cretonne was chosen, as this material is durable, if of good quality, and it does not absorb and retain dust, like most woollen cloths. Of course any material can be used, old dresses often making effective coverings,

If there is not enough of one material to cover all alike, the valance can be different. A patchwork cover might be pretty. First, tack on the valance, just deep enough to clear the floor. Begin at one of the back corners; make a little fold in the cloth every two inches, and tack to the upper edge of the box. These folds will give the necessary fullness to make the valance hang well. For the cover, make a tick of coarse canvas, or something similar, a little larger than the top of the box. Fill with straw, curled shavings, stripped husks, or something similar; feathers may be used by those who have and prefer them. To hold the tick firmly, take a stout cloth of any kind, new, or that previously used for other purposes, and tack it along one side of the cover; draw it tightly over the tick, and tack to the other side, fastening the ends similarly. Now add the final covering, which should be wide and long enough to extend down over the opening, upon the valance. It can be fastened to the cover edges with brass-headed nails, or plain or finned furniture tacks. The tacks may be covered, if desired, with a running cord, sewed on. The corners may be finished, if one wishes, with a bow of ribbon, or cord and tassel. A pillow may be made of the same materials as the tick, or a common pillow be used with a tick like the lounge covering. If the end be set in a corner or against a wall, the pillow will be held in place. Bedding and many other articles may be stored inside the spacious box.

A Home-made Fernery.

BY EBEN E. REXFORD.

If you have a north window in which you cannot grow flowering plants satisfactorily, make a fernery for it. Ferns, and other plants which do well in ferneries, delight in shade, and with them a north window can be rendered very pleasant for all fond of delicate plants. To watch the development of the tiny fronds into long and airy plumes, is a con-

A BOX FOR FERNS.

stant delight to the lover of nature. A fernery can be made at home that will answer all purposes, without being expensive. For the foundation have a zinc pan made at least six inches deep. Most pans for ferns are too shallow to give the roots much chance to spread, and the plants are likely to be crowded. Provide a box as deep as the pan, and large enough for it to set in. One of inch boards, sides and bottom, will be strong enough to allow moving the case, when filled, without wrenching it. Groove the upper inside corner of the four side pieces, to admit the glass. Then make four posts for the corners, long enough to rise at least eighteen inches above the box, and groove the inside corners. Around the top of these put a rail, grooved on its lower inside corner. The frame, when properly made, with the grooves matching, will let glass slip into its place on the sides and ends. They can be secured by glazier's tins. If you prefer a flat-top case, cut a groove in each upper inside corner of the top rail, and have the glass cut to fit. I prefer one with a roof like covering. This form needs three sets of rafters, which can be fitted to the top-rail. This will require two triangular pieces of glass, to fill the space at the ends between top rail and rafters; the end rafters as well as top rails must be grooved, to form a sash for

these pieces. To the lower end of these rafters fit a piece of wood, projecting a little above their upper flat edge, to support the glass which is to cover the case. A ridge-piece is also needed. The accompanying sketch will, I think, explain the whole. Cut the grooves for the glass so that, when placed together, it will serve as a sash. Fasten the frame with long, slender nails. Paint thoroughly. The box looks well with a heavy molding at the bottom, and a lighter one at the top, though this is not necessary. The joints will probably not be airtight, and the plants will do all the better for that. Another article will tell how my home-made fernery is stocked with ferns and other plants, and how it is managed.

About Coughs and Colds.

MRS. LUCY RANDOLPH, WOODSTOCK, VA.

Coughs and colds are prevalent now, especially among children, too often from the ignorance or carelessness of their elder guardians. Many mothers appear to accept with resignation the repeated and violent colds from which their children suffer as providential and unavoidable. A cold is by no means always due to exposure. Indigestion, constipation, a lack of scrupulous cleanliness, the unwise habit of sleeping in much of the clothing worn during the day, unaired bed chambers—all, or any of these things may have far more to do with your child's tendency to cold than the keenest breath of the bracing winter air. And in great measure these things are under your control. Mothers should understand that it is a fact, whether they can see how it is or not, that numerous colds and sore-throats are directly traceable to indigestion and dietetic errors. Quantities of greasy food, fried meats, pastry, and the like, ill-ventilated rooms, and continued constipation, have to answer for many cases of croup, and putrid sore throats. All these things weaken the system and render it far less able to resist changes of temperature.—Give every bedroom a thorough airing every day, more especially if several children are obliged to sleep together, or with their parents. This is to be avoided, if possible: if not, always lower a window slightly from the top—or if this cannot be done, raise it from below. There is frequently bad air enough generated and breathed in the sleeping apartment of a family with small children, to supply them all not only colds, but with a number of so-called "malarious" diseases, to last a year, perhaps longer. Neglect of bathing is another prolific source of colds. A child from three to ten years old should certainly receive an entire bath twice a week in winter. A warm bath at night, taking special care to avoid any chill after, will frequently break up a sudden cold. Keep children from playing in chilly, unused rooms in autumn and winter weather. Let them play out of doors as much as possible, taking care to have their feet warm and dry. A flannel suit and rubber overshoes will often save much cough medicine and doctor's bills. Keep them warmly clad, but do not be content with thick coats and worsted hoods, while short skirts barely cover their knees, leaving the limbs chilled.

A Sand-Paper Block.

Sand-paper is put up by the manufacturers in quires of sheets nine by eleven inches in size. As used by many workmen, nearly a fourth of each

Fig. 1.

sheet is wasted by folding and crumpling over improperly shaped blocks. A convenient block for use (fig. 1), and permitting the use of all the paper, is here described. Make a wedge-shaped piece of

hard-wood, one and a half inch thick, three inches wide, and five and one-quarter inches long, tapering from the head to a sharp edge. Cut a V-shaped hollow across the head. Fit a piece three inches long, of hard-wood, exactly to this hollow.

Fig. 2.

Insert in the head a wood or porcelain drawer knob seven-eighths of an inch in diameter, fastening it secretly by a long screw. Cut a sheet of sand-paper into three equal parts, three by eleven inches. Fold under three-sixteenth inch at each end of a strip, and put them under the head-piece by loosening the same. Tightening the screw will hold it fast and smooth for work. A common wood screw may be used in place of the knob, but is not as convenient, as it must be turned by a screw-driver.

Line Carving.

An improved tool for line carving can be made from a veining tool or smallest fluting gouge. Heat the end red hot over a spirit lamp or in the

Fig.—A TOOL FOR LINE CARVING.

fire carefully, not to overheat or rust it. Bend it under and back like fig. 1, so that it will cut with a draw motion. Do not forget to retemper it. Two sizes of this shape, one-eighth and three-sixteen inches wide, with a straight one-quarter inch fluting gouge and a three-eighth inch flat sweep gouge are all the tools necessary for quite elaborate patterns. A boy can learn to carve orna-

Fig. 2.—A DESIGN FOR LINE CARVING.

mental lines in a few minutes with this tool, without danger of running away from the pattern.

Suppose it is required to line carve a design like fig. 2 for the front of a wall pocket. With pencil and ruler mark the center of the piece to be ornamented, and other guide lines if necessary. Sketch the pattern with pencil lines on the surface. Fasten the piece to be carved so that it can easily be turned about if desired. Carve the principal lines of the pattern, after which the details can be cut with the tool best adapted to the design. Full sized designs on paper can be easily transferred to the wood by pricking through the paper with a needle. Line carving, as a means of decorating surfaces, offers an infinite variety of designs, and is easily learned. Artistic designs suitable for the purpose have long been used by the book-binders and ornamental painters. A little study of any figure will enable the carver to reproduce it off-hand at will. Then with chisel in hand, most beautiful decorations can be produced in a few minutes, when the surface of the wood is of a color to strongly contrast with the lines, cut through it. When the surface is the same as the under part, as in solid walnut, the lines may be gilded or painted.

How to Make a Toboggan.

The following description of a Toboggan with sketches is sent us by Henry M. Weld, aged fourteen years: Toboggans were first made by the Indians, who used them because they cover much snow, and thus support a very heavy weight without breaking the crust or pressing into the soft snow. They are very light to handle, as one six feet long, eighteen inches wide and three-eighths inch in thickness, weighs only twelve or fifteen pounds. They chiefly are made in Canada, where they are much used for coasting. I have had some experience with them and will relate it. I had an oak

Fig. 1.—TOBOGGAN BEFORE BENDING.

board, seven feet long and fifteen inches wide, planed down to three-eighths of an inch thick, but would have preferred one a foot longer and three inches wider. I soaked about two feet of one end in hot water until flexible, and then bent it around a round block of wood about a foot in diameter and fastened it so as to make a curve about three-quarters of a circle, leaving it to dry and harden. For an eight-foot board there should be seven cross pieces as long as the sled is wide, and about thirteen inches apart, and two side pieces running from the

2.—HOW CROSS-PIECES AND RAVES ARE FASTENED.

back of the sled to about two feet from the front. These should be fastened over the ends of the cross pieces. My cross pieces were made of hickory stieks worked about three-quarters of an inch square, and the side pieces of a straight hickory stiek of about the same width, split in two. To fasten them on, the first cross piece should be laid down at least an inch from the back, and then the holes marked for fastening it on, four at each end and two at one-third the width of the board from each side. Do the same thing for each cross piece, and bore the holes. I used a small gimlet, and fas-

Fig. 3.—TOBOGGAN COMPLETE.

tened on the strips with copper wire. When all the holes are bored, turn the board bottom side up and cut grooves between the pairs of holes and parallel to the sides, for the binding wire or cord to fit into so as not to be cut by snow or ice or stop the sled. All the cross pieces are fastened by the holes nearest the center except the front one, which is attached to the opposite side from the others, so that when the board is bent over it will be on the upper side. It is well to have the second cross piece from the front end made a little longer than the width of the sled to fasten the line to draw it by.

The side pieces, or raves, are fastened on over the ends of the cross stieks. These are tied to the cross stieks through the four holes beneath so as to hold the cross pieces as well as the raves firmly. The bottom, as soon as removed from the log, is tightly tied to the third cross piece with wire or strips of leather, always leaving the knots or twists on the upper side, and if wire so that the ends will not catch the clothes. The drawing rope is fastened to the second cross piece and your sled is ready for the snow. Oak board is best, but if not available, hickory or ash will do. Never take a dry or well-seasoned board, as I did, for it is sure to crack in bending. This sled is steered with a strong stiek four feet long, pointed at each end, held in front.

About St. Valentine's Day.

BY ISABEL SMITHSON.

In one of the principal squares of grand old Rome, stands an ancient stone gate-way, known as the Porta del Popolo, or Gate of the People.—It is nearly sixteen hundred years old, and when first built was named the Porta Valentine, or Valentine's Gate, because it led to the church of St. Valentine.—This seems to be a strange beginning for an account of the pretty festival of lace paper and spangles, and gay lover's-knots; yet true, that to find out the meaning of the little rhyme,

"On the 14th of February fine,
I take you for my Valentine,"

we must go to that ancient city which was once the mistress of nations, the queen of the pagan world. In those earlier days the last half of February was held as a religious festival, and the fifteenth day, which was dedicated to Juno the queen of Heaven, and Pan the god of forests and streams, was known as the Feast of Juno Februata.—One of the customs was for young men and maidens to meet, dressed in their best, when each girl's name would be written down separately, and then all these names were shaken well together in a box. Next, each young man drew out a name, and to the girl who chanced to fall to his lot he would give pretty presents and offer himself as partner in the dancing and feasting which followed. The reason for fifteenth of February, was that the birds were supposed to choose their mates on that day. In Italy of course warm weather begins much earlier than with us.—This drawing of names was a very amusing affair, and would have been a harmless one had not the merry-makings generally ended in rioting and drinking, as indeed all pagan festivities were nearly sure to do.—So when Rome began to be a Christian city, the pastors of the church did all they could to stop the festival, but they found this very difficult because the young people were devoted to it; and the drawing of names was long continued even among Christians. There were some changes made, however. The day was called St. Valentine's, and the names drawn were known as valentines. The date was also afterwards altered from the fifteenth to the fourteenth of February.

St. Valentine himself, whose name is now associated with pleasant surprises and loving messages, was a faithful pastor of the "early Christians," and lived in Rome during the third century. The pagan emperor, Claudius II., ordered that all persons avowing themselves Christians should be tortured and put to death, and Valentine went about among his flock, cheering the frightened ones, praying with the dying, and burying the dead. For this he was thrown into prison himself, and refusing to become an idolator, he was cruelly beaten with clubs and then beheaded on February 14th, which chanced to be the eve of the feast of Juno Februata—hence the change of name and date of the pagan festival—and this is all the good brave old man had to do with the custom still bearing his name.

In the seventeenth century the bishop of Geneva, Francis of Sales, put a final stop to the practice of drawing girls' names on St. Valentine's Day, but allowed the people instead to write the names of saints, or holy men and women, on slips of paper and after "drawing" these, try their best to imitate the goodness and piety of the owners of the names. Thus the pagan ceremony became a Christian one.

The modern practice of sending poetic messages on this day is a very old one, and it is hard to say just how and where it began. Chaucer, the first great English poet, speaks of it in his works which were written in the fourteenth century, and Shakespeare and many other poets mention it. The so-called "eemie" valentines are of much later origin, yet let us hope not an American invention, for they are as a rule not funny at all, but only coarse and ugly, and very apt to hurt the feelings of the receiver. In the time of Charles II. it was also the fashion in England and Scotland for friends to draw each other's names on St. Valentine's Day, and give presents as we do on birthdays. The first person known to have sent a written valentine was Charles, Duke of Orleans, a brave French nobleman, who was taken prisoner by the English at the great battle of Agincourt, in 1415. Two hundred years after, a grand marriage was celebrated on St. Valentine's Day, when an English princess, Elizabeth, daughter of James I., was wedded to Frederick a German prince, and to this union is due the strange fact of the daughter of a German family being to-day on the throne of England. This wedding was written of by many poets, and one named Donne in particular composed a pretty poem about it, the first verse of which was:

"Hail, Bishop Valentine, whose day this is!
All the air is thy diocese;
And all the chirping choristers
And other birds, are thy parishioners."

The Doctor's Talks.

As I lifted a parcel a few days ago, by means of the string, the knot slipped and the parcel became undone. I was reminded by this of what an old sea-captain said to me when I was a youngster: "Every boy ought to be able to eling to a rope by his hands, and to tie a square knot." The eling to a rope is something that most boys learn, without instruction, but many neglect to learn the square knot and go through life tying "granny knots," as sailors call those knots which do not hold. A square knot, the more it is pulled the tighter it will bind, and is just as easily made as those knots which come apart with a slight strain. Not only should every boy learn this knot, but girls

Fig. 1. Fig. 2. Fig. 3.

HOW TO TIE A SQUARE KNOT.

also, will find it useful. Shop-keepers have a saying that: "A woman cannot tie up a parcel, she always pins it." To be able to tie a knot that will hold, is an accomplishment quite as useful as many that girls learn. The square knot is best for tying parcels, and wherever two ropes or pieces of cord are to be joined to one another it is one of the safest.

TO TIE A SQUARE KNOT.

Take an end of the cord in each hand, and cross them, laying the right-hand end, *a*, over the left-hand end, *b*, as in fig. 1. Now pass the end, *b*, over toward you and under. This will bring the cords, as in fig. 2; then pass *a* over *b*, and through the loop, which will bring the parts as in fig. 3. By pulling the ends the knot will be closed, and no amount of strain will cause it to slip.

THE AURORA BOREALIS.

As several young people living in Western States have written me about the Aurora Borealis, I think that it must have been more frequent there than at the East, this winter. These boys especially wish to know what causes the Aurora. I am always glad to have such questions, as it shows a desire to learn, but in this instance, it cannot be satisfied. Though many observations have been made, the real nature of the Aurora has not been ascertained. There are many facts which show that the light is due in some manner to electricity, but how, is not known. Nor has it been learned why it should appear at some times and not at others. During the display of the light the compass needle is disturbed, and also the action of the telegraph; both being evidence that the display is electrical.

BY AGNES (CARR) SAGE.

No school for boys in the whole State was more justly celebrated than the Rev. Dr. Bird's, situated on the edge of Millbrook, the large stone building crowning a high hill on the bank of the river, one of the beauties and features of the pretty village.—Few outside of the school house walls knew of the feud which for months had existed among the pupils, or of the battles royal which raged in the play-ground, in consequence of ill-feeling in the school-room. It all arose from some white mice that George Wilson brought from home in September, intending to teach them to perform various tricks, and present them on her birthday, to Effie Bird, the Doctor's only daughter. They were cunning little creatures, with bright pink eyes, and very tame, frisking up and down the curtains and over the sofa and chairs, but mouse-like, when let out of their cage, they would nibble whatever their sharp teeth could find. So it happened that they one day made sad havoc with a handsome copy of Shakespeare, belonging to Ned Brewster, one of the head boys, but which George had borrowed and carelessly left on his table.

Ned was furiously angry, and although George was his best friend and offered to get him a new book, he would accept no apology but went off breathing vengeance. He bided his time, however, and it was not until the eve of Effie's birthday, that George, on going to his room, found some one had let old Tabby, the family cat, loose in the apartment, and she had made short work of the poor little mice, which all lay dead on the floor, with green-eyed Tabby glowering over them. George was thunder-struck, and could hardly keep from crying over the cruel fate of his pets, and he quickly sought Ned, with flashing eyes, and clenched fist.

"I don't care," said Ned, "You had no right to bring nasty destructive pests like those into the school, and let them destroy our things."

"But it was a mean cowardly trick to set the cat upon my mice, as I know you did!" retorted George; and so angry words flew back and forth, the boys joining in the argument, until at last the school was pretty evenly divided into the "Cats" on one side, headed by Captain Ned Brewster, and the "Mice" on the other, led by Captain George Wilson. All through autumn and early winter they annoyed and tormented each other, as only school-boys can, fighting with fists, sticks, and snow-balls out-doors, and tongues and paper pellets—known among the scholars as "spit-balls"—within. So it went on until February Twenty-Second, the birthday of the Father of his Country, a holiday in the school, when the boys had planned a grand snow battle for championship of the school.

At one end of the long play-ground, three terraces led up to a flower garden, in summer gay with bright blossoms, but now covered with a white mantle, broken only by the rich dark evergreen trees, that bent gracefully under their weight of snow. This terrace was known as the "ramparts," and it was the ambition of each side to gain possession, and plant its standard on the highest point.—It was a perfect winter's day, clear and cold, and the boys were on the play-ground at an early hour, preparing the ammunition of well packed snow bullets—the "Cats" waving their emblem of a bunch of swamp cat-tails, and the "Mice" returned it with a flourish of white everlasting, called among the country people "mouse-ear," a bright idea of little Tommy Tucker's, the wit, if not the wisdom of the whole school.

"Remember, no ice-balls are allowed," said George Wilson, as they drew up in line.—"Of course not, we know the rules of the school, as well as you," snapped Ned, for Dr. Bird had strict-

ly forbidden these dangerous missiles. Sam Cox said nothing of the snow-balls he had slyly prepared with stones in the center, unknown even to his Captain, but he called out, "the Cats will make mince-meat of the Mice to-day, anyway!"—"We'd like to see them," shouted Tommy Tucker. "Our Captain's initials are the same as George Washington's, and he will be 'first in war,' too."

"Well, mine are the same as Napoleon Bonaparte's," retorted Ned, who was not to be daunted; "and he was as great a general as Washington, any day."—"Oh! oh! oh!" cried the Mice, for this was too much for the young Americans, and even some of the Cats hissed at the idea.—"Come on," and with me-ows, and squeaks, they started to gain the first parapet, contending every inch of the way, while the air was white with snow-balls that flew thick and fast. How they yelled and struggled, rubbing each other's faces, throwing one another down, rolling in the snow, and almost tearing the coats from their backs. It was very exciting, but several wounded had been removed from the field, with bruises and black eyes, which caused the Mice to begin to suspect Sam Cox's treachery, and increased their fury.—But in the very thickest of the fray, Ned Brewster suddenly shouted, "See, a flag of truce! a flag of truce!" which brought all to a standstill, and all eyes were turned toward the house, from which appeared, crossing the playground, what might have been taken for a snow image, so pale and fair was the young girl who now appeared, dressed all in white, a white fur coat wrapping her slender form, and a snowy cap crowning her long golden hair which floated on the wintry breeze, while in one hand she carried a white flag. "Lady Bird!" passed through the ranks.

"Oh! boys, boys; at it again!" she cried, "when will this dreadful quarrel end?"—"When Cats and Mice can live in peace together, I expect, Lady Bird," laughed George Wilson, using the girl's pet name by which she was usually called.

"Then we should have a happy family, indeed," she said.—"But we don't want any girls here now, spoiling our sport!" growled Sam Cox.—"For shame, shame!" and Sam was quickly landed in a snowdrift. "You forget who begged you off, when the Doctor was going to expel you," said Ned Brewster, severely.—"And who mends our gloves and sews on our buttons," said George.

"I shall never forget how kind Effie was when I had the fever," said one.—"Or how she always remembers our birthdays, and cheers us up when we

are homesick," said another.—"She is the best girl that ever lived: hurrah for Lady Bird!" and all lads joined in cheering with hearty good will.

"Thank you, boys," said Effie, while a shade of pink stole into her cheeks. "I have done very little for you; but I want now to ask a favor. As I came up from the village I passed poor old Aunt Sukey's. She is nearly eighty years old, and bent over with the rheumatism. She was standing in the door, gazing at a great pile of wood the Benevolent Society had sent her. I stopped to speak to her, and she said, 'Lor! little missis, jest see what them 'nevolents hab sent me. Dey mighty good, dey is; but Honey, how am old Aunt Sukey gwine to cut up dem big logs? Might as well try to chop down a tree.'—"I couldn't answer, but I thought it would be such a nice way to keep the

THE MICE IN MISCHIEF

birthday of so great and good a man as Washington, if you boys would go and saw and pile the wood up in the shed, so poor black aunty won't have to wade through the snow whenever she makes a fire. Will you do it?"

"What'll become of the great battle then?" asked Tom Tucker.—"We'll have to declare a temporary peace," said George. "Which do you want to do this work, Effie, Cats or Mice, for you know we never work together?"—"Oh! both parties please join forces for this once."

"I'm agreed, if Ned is."—"Very well," said Ned, "if the fellows are willing."—"Yes, yes, anything to please Lady Bird," came from both sides.—"Then, forward march, Cats and Mice to the attack of the woodpile!" shouted both captains. So arming themselves with borrowed axes, hatchets and saws, they marched with military precision down the hill, headed by Lady Bird with the white flag.

THE FLAG OF TRUCE.—Drawn and Engraved for the American Agriculturist.

Old Aunt Sukey was much startled to see a bevy of rough schoolboys swarming over the fence into her little yard—for they scoured entering through the gate—but the sight of Effie reassured her, and when told their errand her wrinkled old face was one bunch of puckers as the tears and smiles chased each other across it, and she exclaimed, "Bress de dear young gemmans, dey ebeyone deserve to be General Washingtons and de President ob de United States." Meanwhile the boys fell vigorously to work chopping and sawing and splitting; and as "many hands make light work," the great pile rapidly decreased. It was half piled in the shed, and most of the boys were resting in the

tired of this quarrel as I am. Let us shake hands and he friends."—Ned hesitated, but Effie took his hand and slipped it into George's, saying, "I am sure you will, Ned, since George has shown himself 'first in war, and first in peace,'"—"And first in the hearts of his school-fellows," shouted all the boys.

"I will order a copy of Shakespeare to-morrow," said George.—"And I will send to the city for the prettiest white mice to be found," said Ned.—Then every Cat embraced a Mouse, and so on Washington's Birthday the war of the Cats and the Mice came to an end forever. Dr. Bird met them at the house door, and fairly beamed upon the two captains through his gold bowed spectacles as he

called a quiet one. The drawing of lots, the choosing of sides, and all the preparation for playing, as well as the game itself, are accompanied by much loud talk. One boy is chosen to be the "pillar," and the others are divided into two parties, the "bucks" and the "riders." Lots are drawn, to decide which side shall first be the bucks. These station themselves in a row, "making a back," as in leap-frog. The pillar does not seem to have much to do besides giving the first buck something to hold on by, and to see fair play. The riders get to their places, leap-frog fashion, and the first rider, holding up several fingers, says: "Buck, buck, how many horus do I hold up?" If the first

AN OLD GAME FOR YOUNG BOYS.

Drawn and Engraved for the American Agriculturist.

kitchen enjoying a plate of Aunt Sukey's doughnuts when a cry of pain made George Wilson, who was wrestling with an uncommonly hard pine knot, turn suddenly to see Ned Brewster lying on the ground, buried beneath several huge logs which had fallen upon him.—"Oh! help," he groaned; "call the boys!"—Forgetting that this was his enemy, George sprang to his assistance, removed alone the crushing wood, and helped Ned to rise; but he could not stand. "I turned my foot, when I slipped," he said.—"Lean on me," said George, and all were astonished to see the captain of the Mice helping the chief Cat to the house, taking off his boot and bringing water for Effie to bathe the injured part. Fortunately it did not prove very serious, and Ned was able to limp back to the school with the others. As they reached the gate, he blushed and stammered, "I am much obliged to you, George."—"You are welcome, I am sure," said George, holding out his hands, "but as you won't be able to fight again to-day, don't you think it is time to declare a peace? I believe you are as

made them a little patriotic speech in honor of the day, and then invited all to a feast of good things in the dining-room. And at the end of the collation Lady Bird approached the two captains, who sat side by side, and begged to form a new regiment, to be called the "Happy Family Company," to which she presented a beautiful blue silk banner that she and her mother had made in anticipation of this glad event. On it was embroidered a peaceful looking cat with a wee mouse confidently nestled between her paws.—The treaty of peace, formed at that time, I think was never broken.

"Buck, Buck, How Many Horns?"

Old Indian-fighters often say that when an Indian is out-yelled he considers himself whipped, and gives up the fight. Boys, especially if there is a slight dispute about the game, seem to act as if the side of the loudest shouters could gain the victory. The game of "Buck, Buck," can hardly be

buck guesses the right number, the rider takes his place at the rear of the line of bucks, while the lucky buck goes to the rear of the riders. The second buck now becomes the first one, and takes his turn at guessing. If the first buck does not guess the number, the first rider goes to the rear of the riders, and the buck guesses again at the number held up by rider number two, who moves up and becomes the first. So it goes on, the bucks and riders continually changing, making a lively and noisy game, and one that may become rather fatiguing to the bucks, should they not have good luck in guessing. The artist gives the game as he saw it played, and the picture will help in following the changes above described. In some parts of the country a variety of this game is called "Jump, little nag-tail." In this, the bucks are called "nags," and at a signal they rise up, and if the riders fall or touch the ground, they take their places with the nags. We do not know the rules of this game of "Nag Tail," which is evidently even more rude and noisy than the "Buck, Buck."

OUR RECORD

OF

Recent Agricultural Inventions.

It is a familiar observation that the development of scientific and mechanical aids to agriculture, during recent years, has changed and ameliorated the conditions of rural life more than all that had been done in that direction in many previous centuries. Especially in this country has rural life felt the beneficial effects of the social and industrial changes due to the creative activity of inventors, particularly American inventors, the larger number of whom have been farmers or the sons of farmers. That the future is destined to see changes in the means, methods and conditions of rural life, not less rapid and revolutionary than those of the immediate past, is evident from the increasing fertility of inventors in fields of thought having a direct bearing on agriculture and the surroundings of those who live thereby.

Under these circumstances it is naturally becoming more and more needful for farmers to know not only in a general way what our inventors are doing, but also to keep a close watch for all new ideas and devices likely to prove helpful to them or to their rivals in the markets of the world. This for many reasons—for two especially: that they may hold their own in competition with their neighbors; and still more that they may be able to adopt promptly for their own advantage, as inventors or users, any new inventions of use to them, or any useful suggestions that may come from inventions in other fields. It often happens that the clever adaptation of a device to a use radically different from the one the original inventor intended, has resulted in an invention of great pecuniary value. Quite as frequently very promising inventions fall short of real success for the reason that the inventor lacked a full knowledge of the conditions under which his invention was to be used, and so has missed a point of vital importance—a point which the practical and observant farmer may be just the man to supply. In the improvements of agricultural implements and machinery, as in every other connection, real knowledge and practical skill rightly applied are what the world wants most, and is most willing to pay well for.

In view of these facts, it is believed that in addition to the *American Agriculturist* a new department, to contain each month, so far as our space may permit, a review of such of the latest inventions bearing upon rural life and affairs, as seem to be of promise, the value of our paper to all classes of readers will be materially increased. In each case our aim will be to give a clear statement of the nature and purpose of the invention, with so much of the inventor's claims as may appear to be of interest to our readers. The illustrations and descriptions are gotten up entirely at our own expense and by our own editors. In all cases our summary will be strictly impartial, and done solely with a view to increasing the value of the *American Agriculturist* to its readers.

Riding Harrow.—T. L. Cone, Brest, Missouri. Nov. 13; No. 289,232. The patented features of this harrow are, the rigidly connected tongue-rods, *h, h*, so attached to the two sections of the harrow by the swiveled clevis rods, *j, j*, as to prevent the tongue from interfering with the up and down movements of the ends

of the harrow; the uprights, *d, d*, and the swinging hangers of the seat board, and the levers, *g, g*, by which the driver may easily raise either end of the harrow to clear the teeth, or pass freely over stones and other low obstructions.

Seed Dropper.—Samuel Dement, Samuel D. Palmer, and John A. Palmer, East Lynn, Ill. Nov. 13; No. 288,317.—This improvement in seed droppers consists of certain peculiarities of construction, whereby the seed-slide is operated by a spring arm, adapted to give way and prevent breakage, should the slide become clogged. In operation the wheels are lowered till their points and markers enter the ground. When the ma-

chine is started, one of the dropping-arms, *b*, strikes the spring, *i*, and carries it forward, turning the arm, *d*, and, by its connections, carrying the dropping-slide to plant two hills of corn or other seed which may be contained in it. At the same time the marker-blade on the wheel marks the place of the hill, and as the machine passes on, one of the dropping-arms on the opposite wheel re-

peats the movement, and another hill is planted as before. The marking points enable the operator to keep the rows straight, and the hills at equal distances apart. By using the spring-arm to move the slide, the slide is started slowly and without shocks, and in case of any hindering of the slide, the spring-arm gives way, preventing breakage or undue strain on any part of the machinery. The general construction of the machine will be readily understood from the cut.

Cultivator.—J. H. Allen, Wenona, Ill., Nov. 13; No. 288,292.—This figure represents one gang of Mr.

Allen's improved straddle row cultivator. In operation each half of the cultivator is attached to the running gear of any two-wheeled machine, so as to fall on opposite sides of a row of corn or other grain. It will be seen by the figure that no two plows run opposite each other, thus allowing weeds and like rubbish to escape between the plows without clogging the machine. The special advantages claimed are due to the use of beams of unequal length and curvature, and to the manner of attaching the plow feet to the shanks so as to make them adjustable.

Portable Straw-Stacker.—S. H. Garver, Decatur, Ill., Nov. 13; No. 288,224.—This invention con-

sists in a portable frame provided with a pivoting straw elevator and a revolving-brace adjuster, by means of which straw may be carried from the threshing machine

at various angles, both vertical and lateral. The figure shows a side elevation of the stacker when in condition for use. By turning the lever, *q*, the pinions may be carried to the opposite end of the rack, when the frame, *a*, will rest on the support, *s*. A partial revolution of the drum, *z*, will change the lateral position of the straw discharge; or by changing the positions of the pinions, *p*, in the rack. The vertical position of the straw discharge may be varied.

Tile-Laying Plow.—Herbert King, Des Moines, Iowa. Nov. 13; No. 288,344. The object of this invention is to provide a strong and durable machine for laying drain-tiling underground, without opening a ditch, or

removing any soil. It is to be drawn by horses, and consists of three parts; first, a mole-plow, with two flat land sides, two duplex mould-boards, and three cutters arranged to cut two distinct furrow-slices, to lift them so as to admit the laying of tiling underneath, and then replace the soil as the machine advances; second, a sub-soil attachment for making a concave furrow for round tiling; third, a carriage adapted to support the operator, carry tiles, govern the plow and regulate the depth of the drain. The general construction of the machine, and the way it works, are sufficiently shown by the engraving.

Cyclone-Refuge.—Joseph N. Mileham, Jersey City, N. J. Nov. 13, 1883; Letters Patent No. 288,354.—Dwellers in regions subject to tornadoes have learned the utility of under-ground resorts in such times of peril, when nothing above ground can withstand the terrible violence of the wind. Many have saved their lives when in the track of a whirlwind by promptly seeking the cel-

lar; but not unfrequently such places of refuge have proved unsafe, being uncovered and exposed to the fury of the storm by the removal of the house bodily, or made untenable by falling timbers. Mr. Mileham's invention is intended to provide a safer and more convenient refuge in such emergencies. It consists, as the illustration shows, of a metallic chamber, to be sunk in the ground, with proper openings for ingress and exit and for ventilation. A cylindrical form is preferred, and as the refuge is intended to be water proof as well as wind proof, the structure can be used as a cellar or storehouse in places exposed to floods. In the engraving, *A* is the door or cover to the man-hole, to be locked by the chain, *F*, which is tightened with the turn-buckle, *E*. The ventilators are marked *B* and *C*; the entrance ladder, *D*.

Potato Digger.—John Shannon, Wixom, Mich. Nov. 20; No. 288,575.—The figure shows a plan view of this potato digger and gatherer. The bearers of the bed-frame of the truck support a digger shaft, which is

geared to the axle as shown. The digger shaft is armed with curved forwardly projecting prongs or teeth, which, as the shaft rotates, are thrust into the ground to dig up the potatoes. The potatoes roll down the teeth or prongs into the gathering tube, to be carried by a screw conveyor to a basket at the end. The teeth are closer set toward the rear, and at their base are doors to the gathering tube, which open for the potatoes, and are at once closed by suitable mechanism. The gatherer tube has holes for sifting out the dirt.

Metallic Fence Post.—D. R. Scott, Shingle Springs, Cal., Nov. 27; No. 289,149.—This patent covers an improved screw point and means of anchoring metallic fence posts, designed to prevent their yielding in hilly ground where the upward strain of the wires tends to pull them up. The special novelty of the point lies in the thread, which increases in width toward the end of the point, and is flat on the upper side. The widening

thread gives a better hold on the ground while it does not affect the entering capacity of the screw through the less compacted soil nearer the surface. The greater resistance of this form of thread is found especially advantageous on the Pacific Coast, where the ground is baked in summer and softened by the incessant winter rains. The character of the invention is clearly shown in the cut. The base-piece is cast on the wrought iron post. On level ground the anchor bars are not used.

Grain Harvesting Machine.—George Esterly, Whitewater, Wis., Nov. 20; No. 288,784. This invention has reference to that class of machines in which the main frame is adjustable vertically with reference to the main or ground wheel, from which motion is transmitted to the operative mechanism of the harvester and binder. It consists essentially in combining with the main wheel, B, an adjustable main frame, A, and an in-

intermediate arm, L, journaled at one end around the main axle and at the opposite end around the gear shaft, this bar having attachments for communicating motion from the main wheel to the gear shaft. There are also improvements claimed in the form and arrangement of rack plates and other gearing, by which the frame is allowed to rise and fall freely and any binding or cramping of the parts is prevented.

Plow Attachments.—Samuel B. Williams, Sailor's Rest, Tenn. Nov. 20; No. 288,904.—This simple attachment promises to be useful where the soil is light

and free from stones. It is easily attached to the mould-board of an ordinary plow, and serves to cut and pulverize the earth as it leaves the plow, thus saving the labor of harrowing.

Agricultural Machine.—Frederick Nishwitz, Millington, N. J., Nov. 20; No. 288,657. This improvement lies in the method of coupling together two

fully organized machines—seeders, harrows, or the like—by pivotal connections or parallel coupling bars, which will permit each machine to move freely within certain limits, independently of the other. The figure

shows two harrows so joined. The object of this coupling of machines is to obviate the difficulties attending the use of extra width machines as employed in the West, where the need of economizing time and labor makes it desirable to treat as wide a swath or strip of soil as possible in one traverse of the machine over the field. The coupling of two harrows or cultivators so as to allow limited motion forward and backward is not new, though Mr. Nishwitz's mode of doing it appears to be new.

Process and Device for Storing and Curing Grain, Hay, Etc.—Oscar W. Kendall, Olmstead, Ohio, Nov. 13; No. 288,243.—Mr. Kendall's object is threefold: to provide a process by which grain and forage crops generally may be cured in mass, and,

when cured, baled for transportation without rehandling with forks; to provide an inexpensive apparatus that may be readily set up in the field so as to avoid the loading and hauling of the materials in wagons until required for transportation; and to provide apparatus by which the material to be cured may be thrown open to the sun and covered again when desired without forking, thus affording not only facilities for stowing and curing such crops but storage as well. This method of treating forage crops is novel, and is designed to obviate the disadvantages attendant upon the curing of them in the cock or in winrows, especially in rainy weather, and also the risks attending the stowage of imperfectly cured materials in stacks or mows, owing to deficient ventilation on account of the packing of the materials. In the figure a curing stack of ten sections is shown, two of the sections being left partly raised to show the device in operation. The material to be cured is spread upon the lifting frames, B, and held in place by slats and pins, so that it cannot settle when the frame is raised. The jointed braces, S, allow the sections to be thrown over outwardly from the center post so as to let the sun in upon the material to be cured. The roof of each section is made of two boards on a side, permanently fastened together, one over the other, so as to batten the joint. The parts performing similar offices are interchangeable, and the whole may be readily disjoined for compact storage or transportation. In operating the device, the frames are set up in pairs on opposite sides of the center post. If the material is to be haled when dry, a suitable number of baling slats are put upon the frame; then the material is spread on in layers loosely enough to avoid risk of overheating; lastly the supporting rods are put on and secured, and the frame set up. From time to time the frames are lowered for the addition of fresh material until they are full enough. When the time for baling comes the supporting rods are removed and proper baling slats are set opposite those first placed. Wire bands bent hairpin fashion are then passed down through the layers so as to clasp the slats. Power is then applied, the frames raised, and the material compressed. In compressing the bands are forced through the layer to their utmost extent, when they are locked by twisting the free ends together. The slats are then sawed in proper

lengths, and the material cut up, layer by layer, into suitable bales.

Grain Header.—John A. Rumrill, Salina, Kansas. Nov. 27; No. 280,144.—Mr. Rumrill claims an endless-chain sickle, the sections having cutting edges perpendicular to the line of travel along the guards, the sections being linked together suitably for running on a driving pulley; also guides with suitable tightening devices for taking up the slack of the chain, together with

a contrivance for keeping the chain in its proper course, and means for operating the endless sickle; also an extension carrier for delivering the grain from the elevator to a wagon alongside the header. A plan view of the principal part of the header is shown in the figure.

Sulky Plow.—C. A. Kellogg, Columbus Grove, Ohio, Nov. 13; No. 288,341.—Mr. Kellogg claims a number of devices in the construction of sulky plows, by which the cost of such machines may be lessened, and the parts adjusted to allow the use of right or left-hand plows of any ordinary form. The figure shows the machine as adapted for use with three horses and a left-hand plow in breaking ground. A few easily made changes adapt the machine for corn-plowing. By means

of the hand lever and its attachments the driver can easily lift the plow for carriage or to avoid an obstruction.

Harrow.—Frederick Nishwitz, Millington, N. J. Nov. 20; No. 288,658.—In this invention Mr. Nishwitz has aimed to make sundry structural improvements in the sulky harrow patented by him Aug. 15, 1882. These improvements relate to the fixing of the driver's seat, the securing of the draft pole to the harrow instead of to the sulky frame, the connection of the pole with the

transverse gang-bars, the means of attaching the trailing teeth to the gang-bars, and in other details which need not be described here. By these improvements, it is claimed, a very efficient, strong, and easily handled machine is to be had, and one which may be quickly adjusted to suit all the varying conditions of the various soils.

EVERY FARMER SHOULD READ ROE'S NEW STORY

BEGINNING IN THE

CHRISTMAS (December) Number

OF

HARPER'S MAGAZINE.

(THE FIRST NUMBER OF A NEW VOLUME.)

Mr. E. P. Roe is widely known as a fruit-grower as well as one of the most popular of American novelists. In

NATURE'S SERIAL STORY,

he follows month by month the incidents of farm-life and the changes of nature in a country home in the Highlands; and most delightful pictures of nature have been made for it by the celebrated American artist, W. HAMILTON GIBSON, author of "Pastoral Days" and "Highways and Byways."

The Christmas Number, containing the opening chapters of Mr. Roe's Serial, will be mailed to any part of the United States on receipt of thirty-five cents.

B. K. BLISS & SONS, 34 Barclay Street, New York

NOVELTIES FOR 1884.

Peas Until Frost.
Bliss's Abundance Pea, 90 pods counted on a single plant.—Very productive, 15 to 18 inches high, requires no brushing. Second Early. Excellent quality. 25 cents per packet, 5 packets \$1.00.

Bliss's Everbearing Pea.—A perpetual bearer yielding a full crop until frost; an excellent late variety, 18 to 24 inches high, requires no brushing. Peas 1 1/2 inches in circumference. Immensely productive. 25 cents per packet, 5 packets \$1.00.

Bliss's American Wonder.—The best and earliest variety grown. Very dwarf, excellent flavor. 20 cents per pkt., 40 cents per pint, 75 cents per quart, post-paid.

N. B.—These three varieties will give you peas through the entire season until frost.

American Champion Watermelon.—The best eating and best shipping melon grown. More productive than any other sort. 25 cents per packet, 5 packets \$1.00.

Cardinal Tomato.—Handsome variety grown; brilliant cardinal color inside and out, no green core, and few seeds; early, solid, good keeper. 25 cents per packet, 5 packets \$1.00.

White Plum Celerery.—The most ornamental and easiest variety grown, requiring no banking to blanch. Crisp, solid and nutty. 50 cents per packet. **Golden Heart Lettuce.**—Heads large, firm and solid, with golden yellow heart; stands hot weather wonderfully; very handsome, crisp and brittle. 25 cents per packet, 5 packets \$1.00.

Orange Cream Cucumber.—Deep salmon color, of excellent flavor, very aromatic; 25 cents per packet, 5 packets \$1.00.

Early Genesee Sweet Corn.—Extra early, superior quality; ears large; very productive, 25 cents per packet, 5 packets \$1.00.

One packet of each of the above, amounting to \$2.45, and Gardeners' Hand Book telling how to plant them, for \$1.75. Order NOW and have on hand when you want to plant. For complete list, see Bliss's Illustrated Novelty List for 1884, which contains description of all the newest and choicest Flowers, Vegetables, Cereals, Fruits, Plants, &c., &c. Mailed to all free.

HANSELL The earliest and most valuable Raspberry, large, bright crimson, very firm, productive, extra hardy North and South. **EARLY HARVEST**, the earliest and most profitable Blackberry. **ATLANTIC & DANIEL BOONE** Strawberries. Send for full particulars; mailed free. The largest and best of Strawberries, Raspberries, Blackberries, Gooseberries, Currants, and Grapes in the U.S. Also, Fruit Trees and Nut-bearing Trees, including Kiefer and Le Conte Peaches, the new Peaches—Japan Giant Chestnut, &c. Richly Illustrated Catalogue, with honest descriptions, truthful pictures, and fair prices, free. It tells what to plant, how to plant, and how to get and grow Fruit Trees and Plants; the finest and most useful catalogue of the kind published.

J. T. LOVETT, Little Silver, New Jersey,
Introducer Guthrie Raspberry and Manchester Strawberry.

VICK'S FLORAL GUIDE

For 1884 is an Elegant Book of 150 Pages. Two Colored Plates of FLOWERS and Vegetables, and more than 1000 Illustrations of the choicest Flowers, Plants and VEGETABLES, and Directions for Growing. OUR NEW CATALOGUE OF GARDEN, FIELD AND FLOWER SEEDS

Will be mailed Free to all applicants, and to customers of last year without ordering it. It is a beautiful book, full of illustrations, and contains a vast amount of information for the Gardener and Farmer. We warrant our Garden Seeds to be fresh, and true to name, and in quality equal to any sold. Our collection of Vegetable Seed is one of the most extensive to be found in America.

Gardeners and others desiring Pure and Good Seed should send for our book at once. Compare our prices before buying. We offer all kinds of Seed Drills, Firefly Plows, Gem Cultivators, Horse Hoes, etc., at special rates to gardeners and large growers. It will pay you to send for our Catalogue before buying Seeds or tools.

MENDENHALL & CO., 78 East Market St., Indianapolis, Ind.

NEW VEGETABLES A SPECIALTY.

My Vegetable and Flower Seed Catalogue for 1884 will be sent FREE to all who apply. Customers of last season need not write for it. All seed sent from my establishment warranted to be both fresh and true to name, so far, that should it prove otherwise, I agree to refund the order gratis. My collection of vegetable seed is one of the most extensive to be found in any American catalogue, and a large part of it is of my own growing. As the original introducer of Eclipse Beet, Early Ohio and Burbank Potatoes, Marblehead Early Corn, the Hubbard Squash, Marblehead Cabbage, and a score of other new Vegetables, I invite the patronage of the public. In the gardens and on the farms of those who plant my seed will be found my best advertisement.

JAMES J. H. GREGORY, Marblehead, Mass.

quested to send for my Catalogue for 1884. It will cost you
nothing—the Deacon says it is worth all it costs.

JOSEPH HARRIS,
Moreton Farm, Rochester, N. Y.

Copyrighted

by W. Atlee Burpee & Co.

W. ATLEE BURPEE & CO.
PHILADELPHIA, PA.

BURPEE'S WELCOME OATS.

As claimed by us last year, the **WELCOME OATS** have proved, beyond all doubt,
to be the **heaviest, handsomest and most productive variety** ever
introduced. In order that they might be thoroughly tested in every section of the country,
we sold them last season only in 2 oz. packages, and distributed gratuitously
upwards of **sixty thousand** small sample packets.

To award the prizes for the largest yields and best heads was such a difficult task that
it was necessary to call upon some disinterested and well-known judges. **DR. GEORGE
THURBER**, of *The American Agriculturist*, kindly consented to act as Chairman of the Com-
mittee of Judges, and by his report it will be seen that there were 1073 duly authenticated
reports competing for the prizes on yields, and 526 competitors for prizes on best heads of
oats. Besides these, we have received hundreds of letters telling of the success of the free-
trial packets. **Ten and three-fourths measured bushels**, weighing
Four Hundred and Seventy-three and one-half pounds (473 1/2
lbs.) were raised from one two-ounce package of the Oats. That 7576
ounces of clean Oats could be raised from 2 ounces of seed, would certainly be
beyond belief, were it not on the sworn statement of a well-known man, whose word is
beyond question—and that others in various sections have also made most enormous yields.
The **IMMENSE PRODUCTIVENESS OF THE WELCOME OATS** is
explained by their wonderful stooling (often 40 to 75 stalks from a single grain), the
great size of the heads, and the heavy weight of the grain. [The accompanying illustration
represents a single stool of Burpee's Welcome Oats—76 stalks grown from one seed.]

THE WELCOME OATS Grow five to six feet high, with strong, straight
straw, well-supporting the enormous heads, and not
liable to be prostrated by wind or rain. The heads are very large and handsome, branching
freely on all sides, and from sixteen to twenty-three inches in length. The grain is remarkably
large and handsome, very plump and full, with thin, white, close-fitting husks. They weigh
47 to 51 1/2 LBS. PER MEASURED BUSHEL.

No improved variety of grain ever introduced has had such strong testimony as to super-
lative merit. Every one sowing the **WELCOME OATS** this season can certainly feel
assured that they are by all odds the **Best and Most Productive Variety**
in the World. Their uniform success in every part of the country proves their general
adaptability to our varied climate, while their **early maturity** renders them specially
valuable. They ripen a week to two weeks ahead of other Oats, and on this account yield
splendid crops, even in the extreme South.

Every Farmer and Planter will want the **WELCOME OATS**; and those who pur-
chase this season will be able to dispose of their entire crop for seed, at high prices.

PRICES: 15 Cents per packet; 75 Cents per lb.; 3 lbs. for \$2.00, postpaid.
Peck, \$3.00; Bushel (32 lbs.) \$10.00. Each peck and
bushel bag is secured by our **Lead Seal**, and warranted to contain genuine
WELCOME OATS, if the
seal is unbroken. Every pur-
chaser is entitled to compete for **\$600 IN CASH PRIZES**
FOR 1884.

We desire to ascertain the heaviest yield that can be produced from one bushel of **WEL-
COME OATS**. Even those who do not win a prize will be more than repaid for any extra
cultivation, by the increased yield and the high prices sure to be obtained for these Oats, for seed.

\$400 FOR LARGEST YIELDS FROM ONE BUSHEL. First
Prize, for the largest quantity raised from one bushel of seed, \$100; Second,
Third, Fourth, Fifth and Sixth Prizes, each \$50 Cash; Seventh
and Eighth Prizes, each \$25.

\$120 FOR LARGEST YIELDS FROM ONE PECK. First Prize,
\$50; Second, \$25; Third, \$20; Fourth, \$15; Fifth, \$10.

\$80 IN PREMIUMS FOR THE BEST HEADS OF OATS. First
Prize, for the heaviest and best six heads, \$25; Second, \$20; Third,
\$15; Fourth and Fifth Prizes, \$10 each.

The **WELCOME OATS** (except small lots by mail), are sold only in sealed bags,
containing one peck (price, \$3.00), or one bushel (price, \$10.00). In each bag is an envelope,
containing a competition card, which entitles the purchaser to compete for the bushel or peck
prizes, as the case may be, and for the prizes on heads. This card bears our fac-simile signa-
ture, and must be returned with the report, thus showing at once that the competitor
obtained seed of **WELCOME OATS** from us this year, 1884.

CAUTION!—The wonderful yields, fine
quality and universal success attending the intro-
duction of **BURPEE'S WELCOME
OATS**, may induce unprincipled parties to
pass off other Oats for **WEL-
COME**. We send out no
travelers to sell these Oats at
retail; but we allow agents and
clubs a discount in lots of five
bushels or five pecks—each bushel
and each peck, however, is put up
in sealed bags, with our name on
the leaden seal. Please examine
this before purchasing from any
unknown parties.

Large Illustrated Poster

And circular combined, telling all
about **THE WELCOME
OATS**, with all the prize reports
and many testimonials, together
with Burpee's **Abridged
Catalogue of New and
Standard Seeds** will be sent
FREE on application.

CANVASSERS Wanted EVERYWHERE for the **AMERICAN AGRICULTURIST**, English and German. For splendid inducements address immediately **ORANGE JUDD CO., Publishers, 751 Broadway, New York.**

Pension Matters.

"A. N.," Arkansas Co., Ark., writes us that three years ago he was examined for an "increase of pension," which was allowed him. Since then he has written to Washington many times, and paid numerous attorney's fees; as he gets no pension or reply, he comes to us for advice. The best thing for him to do is, to write out a plain statement of his case, giving names and dates, and send it to the member of Congress who represents his district, asking him to look up the case, and advise him how he can get the money that is due him.

"Chesapeake Bay Dogs."

The Chesapeake Dogs, long celebrated for their value in hunting water fowl, and for great endurance, are now very scarce. A correspondent writes us that he has been offered one for five dollars. Our advice is, don't buy, as it can not be pure-bred. One of the officers of this Company had a dog of this rare and valuable breed, which the above price with two ciphers added could not purchase.

Wanted, a Young Man.

One of the meanest swindles is to advertise for a young man with a sum of money. Sometimes this is as small as twenty-five or fifty dollars, or it may be that two or three hundred is named. The young man is promised a good salary, and he unsuspectingly loans his employer the money. An excuse is soon found to discharge the young man and the game is repeated with another.

Hog Cholera—"A Sure Cure."

"W. H. S.," Dayton, O., writes us that a man in Indianapolis, Ind., "is taking in unsuspecting country people," with a "sure cure" for hog cholera, and asks us "to warn our subscribers against the fellow." If our friend had sent us a circular or advertisement of the stuff, we might have been able to judge of it, and to issue the desired warning, but when we are given only the name and residence of the fellow, we are unable to "do the public a service." Send us the documents.

Grain and Cattle Enterprises.

Very flattering promises are made by parties who propose to carry on cattle raising and speculation in grain in the far West. Some of these propose dividends as large as five per cent. per month. Several have asked our opinion of these schemes. We would not advise any one to invest in such enterprises; they are carried on at a very long distance off, and managed by strangers; safe investments can be found nearer home.

The Counterfeit Money Swindle.

Now if there is any one form of swindling that we have shown up in all its phases, all its ins and outs, for the last twenty years, it is this. Yet here is a subscriber in Iowa, to whom the matter is entirely new, who, evidently not having heard of it, naively writes: "These parties ought to be published." We need only say now, that these circulars do not appeal to honest men. Our correspondent speaks of "these parties," signers of the circulars, evidently not knowing that they have a vast number of aliases. We have known as many as twenty different names used for the same circular.

"I Think It Is a Humbug,"

Writes Mr. D. Stout, who in renewing his subscription forwards us several advertisements of a New York firm. One of these announcements states, "You can now grasp a fortune," illustrated by a cut of an open hand loaded with coin, and not grasping at all. The reader is told: "If you return this slip with twenty five cents, either in currency or postage stamps, we will send you a package of splendid articles worth a great many times twenty-five cents, and which we know will enable you to grasp a fortune and earn from seventy-five to two hundred dollars per month, rain or shine, all the year round, honorably and easy."—As we infer, something is promised for the twenty-five cents, which will enable the receiver by selling it, or otherwise, to make the sums named. If any such profits are to be

realized from a twenty-five cent investment we would suggest to the advertising firm to "grasp a fortune" itself, it would pay better than to sell the chances for "grasping" at twenty-five cents each. This is a trade, as the boys say, "on sight unseen." The only definite statement is that twenty-five cents is to be paid. After that our "grasps" his "fortune," whatever that may be. If this is not a lottery it would seem to be sufficiently a game of chance for the attention of the Postal authorities.

Book-keeping for Fifteen Dollars.

Announcements are often made that book-keeping will be taught for fifteen dollars, or some such sum. Many young men, especially those in the country, are under the impression that there is always a demand for book-keepers, and that by expending a few dollars they can fit themselves to occupy a place with a good salary. In New York, and no doubt other large cities, there are hundreds of young men who have come in the hope of finding a place as book-keeper and having expended all their means are not able to get away. Some of these are driven to theft, and not rarely a suicide ends the miserable waiting. A friend of ours needing a book-keeper advertised for one, not long ago, and the next day received over five hundred answers. The demand for book-keepers is far less than the supply. It is a mistake to think that more book-keepers are wanted than cities can furnish.

A Wonderful Plum.

J. E. Pratt, Solana Co., Cal., writes us: "I send you a circular not exactly of a 'Blue Rose,' but of a Plum that is, to say the least, wonderful."—The circular announces that the signer will have for sale one hundred thousand African plum and prune plants from Cape Town. These remarkable plants were discovered in a journey to the diamond fields in 1875. They are bushes about five feet high, can be planted close together "and each one will bear a gallon of fruit." That there may be a South African bush with an edible plum-like fruit, is quite likely. That it is really a plum is doubtful. When it is stated that the plants bear "the most beautiful round, thin-skinned and pale-red, delicious fruit that man ever saw or tasted, each plum being as large as the average French or German prune, with the tiniest little freestone, not larger than a grain of white corn," we take it with a grain of allowance. We have had some experience in desert countries, and know how easy it is to regard a fruit that can be eaten at all, as the most delicious ever tasted. The importer shows much enterprise in procuring the plants which he offers, but his description is no doubt overdrawn; still the fruit may be worth trying.

His Father's Corpse.

A well-to-do farmer, while waiting for the train at a depot in Pittsburgh the other day, was accosted by a stranger who was also waiting. The stranger was a glib talker, and the farmer being rather lonely, was glad to meet him. As they were talking, a couple of men in railroad uniform came up and asked the stranger to pay the charges as the train would soon be off. The other did not think he must pay in advance, and had not near enough money to pay the one hundred and twenty-five dollars demanded, "Well," said the others, "corpses always pay in advance, if you can't pay, the corpse can't go." The son of the corpse explained to the farmer that he was taking his father's body home for burial, the funeral had been appointed, and unless the body could go upon that train the services must be postponed. He had a check for six hundred dollars on the bank at N., the place of his destination, but this the railroad men refused to take. At last he appealed to the farmer to loan the sum to pay the charges, and as they were both going to N., he would get his check cashed, and make all right. The good-natured farmer advanced the money, for which the bereaved son was duly grateful, and insisted that the other should hold the check as collateral security. They both boarded a car, but the train had hardly left the suburbs of the city before the young man found it necessary to go to the baggage car to see if the corpse was all right, but failed to return. Before the farmer reached home he learnt that there was no corpse on the train, that the son was not to be found, and it slowly came to him that he had been swindled by his new acquaintance. The farmer had inadvertently mentioned his destination, and the other took advantage of the information. Of course the other men were confederates, and were not employees of the road. Be cautious in making acquaintances in travelling.

ted complete and ready to be

put into the deepest wells.

Full supply of Hose, Iron

Pipe, and Brass Goods.

Send for Circulars.

"ACME" PULVERIZING HARROW

AGENTS
WANTED.

It is the best selling
tool on earth.

The "ACME" subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **double gangs of CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling off the ground and thoroughly pulverizing the soil** are performed at the same time. The **entire absence of Spikes or Spring Teeth** avoids pulling up rubbish. It is **especially adapted** to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface** of the ground.

We make a Variety of Sizes working from 4 to 15 Feet Wide.

DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

SEND FOR PAMPHLET CONTAINING THOUSANDS OF TESTIMONIALS FROM 41 DIFFERENT STATES AND TERRITORIES.

BRANCH OFFICE:

MILLINGTON, N. J.

N. B. PAMPHLET "TILLAGE IS MANURE" SENT FREE TO PARTIES WHO NAME THIS PAPER.

Champion Grain and Fertilizer Drill.

POSITIVE FORCE FEED DISTRIBUTORS.

SPECIAL DEVICE for planting corn for the crop.

FERTILIZER ATTACHMENT

Unequalled, and is warranted to distribute accurately, evenly and easily any commercial fertilizer—wet or dry.

Draft light and easily handled. Construction simple, Materials and workmanship the best.

We also make the WHIPPLE SPRING TOOTH SULKY AND FLOATING HARROWS, CULTIVATORS, &c.

These HARROWS are adapted for use on all kinds of soil, and are the best pulverizers known. No farmer can afford to be without one. Ample time given for trial before settlement. BROADCAST GRAIN SEEDERS, with SULKY HARROWS, when desired. Send for descriptive pamphlets to

GERE, TRUMAN, PLATT & CO., Owego, Tioga County, N. Y.

Improved Harrow. Good for all work; can be shipped anywhere at small cost; saves time and money; made only by the Patentee; send stamp.

S. HUTCHINSON, Griggsville, Pike Co., Ills.

STROWBRIDGE

BROAD-CAST

SEED SOWER

THE BEST, CHEAPEST and SIMPLEST.

Sows all grains, grass seeds, lime, salt, ashes, fertilizers—and everything requiring broadcasting—any quantity per acre, better and faster than by any other method. Saves seed by sowing it perfectly even. Sows single or double cast, all on either or both sides of wagon. Not affected by wind, as the seed is not thrown up into the air. Perfectly simple. Readily attached to any wagon. Lasts a life-time. Can be used wherever a wagon can be driven. (Can walk one mile sows four acres of wheat. Crop one-fourth larger than when drilled. Send stamp for circulars giving terms and testimonials. Mention this paper.

C. W. DORR, Secretary,
DES MOINES MFG CO., Des Moines, Iowa

THE CHICAGO COMBINED PATENT Flexible Harrow and Grain Cultivator.

All Teeth. Steel Best implement in use. Unequalled as a sod harrow and pulverizer. Works equally well in growing Wheat, Potatoes or young corn. Adds 5 to 10 bushels per acre to the yield. 25 to 50 acres per day cultivated by one team. Will pay for itself in one year. Send for Illustrated Price List. The Chicago Flexible Harrow Co., Sole Proprietors and Manufacturers, 35 to 41 Indiana St., Chicago, Ills.

HEEBNER'S PATENT Level Tread Horse Power WITH SPEED REGULATOR.

Heebner's Improved Little Giant Threshing Machine.

No other Power is as powerful and easy for the horses. The Level Lags and Speed Regulator are the most valuable improvements ever made in horse powers. See that you get Heebner's, any other with level lags will be an infringement upon our patents.

The Little Giant has more good points than any other Thresher. None can do work as fast, nor any better, and none are better made. Union Feed Cut'er, Drag and Circular Saws, etc. Send for Illustrated Catalogue.

HEEBNER & SONS, Lansdale, Pa.

HENCH'S Riding or Walking Corn and Fallow CULTIVATOR.

With double Row Corn Planter and Fertilizer Attachments complete in one Machine.

RECEIVED MEDAL AND HIGHEST AWARDS OF MERIT AT THE GREAT SOUTHERN EXPOSITION, LOUISVILLE, KY., AND A NUMBER OF STATE FAIRS IN 1883.

THE KING OF THE CORN-FIELD.

Thousands in use giving entire satisfaction. The demand already this season is three times as large as last year.

RELIABLE AGENTS wanted in all unoccupied territory. Manufactured at York, Pa., and Orrville, Ohio. Send for catalogue mailed free. Address,

DARNELL'S PATENT FURROWER & MARKER

Leaves the earth well pulverized at bottom of furrow. Marks any width from 2 1/4 to 5 feet, and from a mere mark to 6 inches deep.

"Take pleasure in recommending it. It does the business; is well made and will last for years." J. S. Collins, Moorestown, N.J. "It far exceeds my expectations. If the real merits of this cheap implement were known to potato growers alone, the sales would be immense." E. L. Coy, Pres. Wash. Co. (N.Y.) Agr. Society.

H.W. DOUGHTEN Manufacturer, Moorestown, Burlington Co., N. J.

NEW SPECIAL PREMIUMS.

WITHOUT MONEY.

A Magnificent Shot Gun
For a Remarkably Low Price,

(and FREE also.)

DOUBLE-BARREL BREECH-LOADER { **FOR FARMERS;**
 FOR HUNTERS;
 FOR EVERYBODY.

The Publishers of the **AMERICAN AGRICULTURIST** have the pleasure of announcing to their subscribers, that by special arrangement they have secured a great desideratum—a very excellent Double Barrel, Breech-Loading Shot Gun, one that will do **GOOD WORK**, which they can supply at less than **HALF** the **PRICE** usually asked for guns of equally good quality and make. Aside from all hunting and sporting purposes, **A GUN IS NEEDED ON EVERY FARM**, to exterminate pests.

TO AVOID DELAYS a breech-loader is to be preferred by far, as there is no ramming of ammunition; the cartridges are easily and quickly removed always before taking it into the house or into a wagon, or setting it away. The cartridges can thus be kept safely, yet be instantly got out and inserted in the gun when needed—no hunting up powder, shot, wads, caps, etc. The breech-loader **IS EASILY CLEANED AND KEPT CLEAN**; does not get worn at the muzzle (which gives final direction to the charge) by the ramrod. No ramrod is used.—**FURTHER**, one can keep cartridges loaded with various sizes of shot, and at any moment insert the kind required.

A gun of good make is **CHEAPEST AND SAFEST**. The country has been flooded with a lot which, though looking well externally, are really **DANGEROUS, AND HAVE NO DURABILITY**—always something getting out of order.

By special arrangement a gun possessing **ALL THE GOOD QUALITIES** for a Farm Gun and quite well adapted to hunting has now been secured, and **AT A VERY LOW COST**.

Before deciding upon its merits we submitted some of these guns to **A THOROUGH, CAREFUL TESTING**, shot for shot along with other superior guns (one of them a \$250 shot gun from London.) These trials were in every way careful (see specimen targets and notes under) in the presence of one of our editors, who is well acquainted with the theory and principles of gunnery, and **THE RESULTS WERE MOST CRATIFYING**.

The Barrels of this Gun are of **FINE LAMINATED STEEL** thoroughly tested and finely finished; the action is the **RELIABLE, SAFE AND DURABLE** Lefebvreux Lever Action, that for strength **IS INCOMPARABLY SUPERIOR** to any side lever action now made, and it will outwear a dozen side levers; this Gun has Steel Freed Locks, the stock is solid walnut, oil finished, and full checked; and we can supply either 10 or 12 bores, 30 or 32-inch barrels, and weighs from 8 to 9½ pounds.

This Gun we will supply to the readers of this journal for the low price of \$19.00—not half the usual cost of equally serviceable guns.

We will **PRESENT** one to any one sending 25 subscriptions to the *American Agriculturist*, at \$1 50 a year each.

The **"HANDY GUN,"** (shown below) is one of the most perfectly made single barrel shot guns ever produced—in metal, quality of barrel and lock, stock—**EVERY** The barrel (which was tested for strength by powerful charges of powder) **IS TRUE IN BORE** throughout to the thousandth part of a hair, and will shoot round balls very accurately. Its calibre, No. 17, adapts it to small loads, 2 to 2½ measured drachms of powder, and ¾ to 1 oz. shot, and owing to its true bore it throws the shot well massed (see target). In the trials referred to elsewhere, witnessed by one of the editors of this journal, it made just as good targets as \$40 to \$250 guns, used with it for comparison.

EXPLANATORY NOTE.—These guns were made under the direct supervision of the United States Government, and subjected to the **MOST THOROUGH TESTS** and careful inspection in every particular. They were the last made before changing to rifled barrels, and have never been used, but are new and **IN ABSOLUTELY PERFECT CONDITION** as shown by the Government inspector's marks. It cost over \$20 each to produce them.

For **FARMERS, FARMERS' BOYS** and others who wish a good reliable gun—for hawks, rabbits, etc., for protection, etc., etc., this is **JUST THE GUN. IT COSTS BUT A TRIFLE.** The barrel is of solid steel of the finest quality, and is 32 inches long; the lock is of same material, is very perfect, strong, and durable; and the stock is of American walnut, oiled.

As to shooting; the Targets herewith shown speak for themselves. They were made off-hand at 30 yards, the charges consisting of 2½ drachms powder, 1 oz. shot, using Eley's wads for both.

☞ This Gun we will supply to readers of the *American Agriculturist* for \$6; or, we will **PRESENT** one to any person who will send 7 subscriptions to the *American Agriculturist* at \$1.50 each.

Express prepaid on either gun to any point east of the Mississippi River, when \$1.00 extra is sent us.

W. Scott Gun, Right Barrel.

W. Scott Gun, Left Barrel.

"Handy Gun," 3rd Shot.

"Handy Gun," 8th Shot.

[REDUCED FACSIMILES.]

FAIR SPECIMENS
OF MANY TARGETS,
(15 inches square.)

In thorough Trials of
these Guns,

MADE BY

MILO SEAGEARS, Esq.,
at Florida, Orange Co., N. Y.,
in November, 1883.

DISTANCE, 30 YARDS,
(fired without rest.)

Loading: SCOTT GUN, Powder, 3 measured drachms, (87 grains weight); Shot, 1 ounce.

"HANDY GUN," Powder, 2½ measured drachms (70 grains by weight); Shot, ¾ ounce.

In all trials for both guns: Powder, Hazard's Kentucky Rifle, F. G.—Shot, Tatham's No. 8.—Wads, Eley's Elastic, one size larger than the bore; same wad over both powder and shot. Both powder and shot shaken level, and wads put down evenly and level.

ADDRESS, **ORANGE JUDD COMPANY,**

TAINTOR BROS., MERRILL & CO.,

18 & 20 Astor Place, New York City.

ANNOUNCEMENT FOR 1884.

DR. LEWIS'S MONTHLY will keep step with the most ambitious and vital of our large magazines. It will be illustrated whenever the subjects demand such aid, but its peculiar feature, as heretofore, will consist of an able, earnest and determined discussion of Sanitary and Social Questions. Those who have read the past issues of this magazine will need no assurance of the ungloved vehemence of its work. It leaves no room to doubt its meaning or purpose. Dr. Lewis will contribute to each issue papers on hygienic themes whose value even earnest people will find it difficult to exaggerate, while nearly a hundred writers known to the public will contribute papers on living subjects.

Although among the largest and most beautiful of our magazines it is only **\$2.50** per year, or **25 cents** a number. For sale by all newsdealers.

Kind Words.

We continue to give simple extracts from vast numbers of pleasant words which come unsolicited from our subscribers:

Twenty Years and Over a Subscriber.

DORCHESTER, QUEEN CO., MO.

"I have taken the *American Agriculturist* for over twenty years. I cannot do without it. I think it one of the best friends to farmers." **J. ZINK.**

Twenty-one Years a Subscriber.

"A Subscriber since 1862. I still find that every year it increases doubly in value."

Subscribes Five Years Ahead.

RUMSON HILL, SEABRIGHT, N. J.

"Please charge me with five years' subscription to the *American Agriculturist*, and then I shall not be without that most valuable of all papers of that class, by means of neglect of renewal." **CLINTON B. FISK.**

A Continuous Subscriber.

PORT BYRON, N. Y., April 12, 1883.

"You may count on me as a continual subscriber to the best farmers' paper in America." **W. S. WETHEY.**

Best Paper.

"For a long time I have been an earnest reader of your journal. I think it the best paper of the kind published." **H. W. BROWN, Binghamton, N. Y.**

Best for the General Farmer.

"I think the *American Agriculturist* the best paper for the general farmer I ever read. I fail to see where there is a possible chance for improvement." **CHAS. W. DENNIS, Neligh, Neb.**

Good for Teachers.

FREEPORT, ILLS., Dec. 24, 1883.

"I am a teacher by profession, but have been a constant reader of the *American Agriculturist* for the last twenty years, and can't well do without it."

A. A. CRARY.

A True Friend to the Farmer.

RED WING, MINN., March 1, 1883.

"The *American Agriculturist* is a true friend to the farmer; it gives good advice, exposes all kinds of frauds, etc. I do not feel afraid to recommend it, and I wish it could be in every household in place of many worthless papers which do more harm than good. Success to you." **LEWIS JOHNSON.**

Still Improving.

EAST BLOOMFIELD, N. Y., March 5th, 1883.

"As far back as I can remember, father was one of your subscribers. Since then, the journal has improved, until now, it is far in advance of any and all agricultural periodicals. There is not a single number but contains one or more suggestions which are worth more than a year's subscription." Yours, **WM. M. BRADLEY.**

Adapted to the South.

"The *American Agriculturist* is a most excellent publication, and I only wish it was in the hands of every farmer and planter in the South."

L. E. TAYLOR, New Orleans, La.

A Treat to Our Home.

BAYSIDE, N. Y., Dec. 31, 1883.

"The picture, 'Foes or Friends?' has given us much pleasure, and is certainly a generous gift, which will probably be appreciated by many of your readers. Have found no agricultural paper at any price to equal yours—which is a treat to our home monthly."

HENRY SACKENDORFF.

Satisfactory Premiums.

WATERBORO, YORK CO., MAINE, March, 1883.

"The Premium pump has been received, with which I am highly pleased. Everything is now satisfactory."

C. W. COSTELLO.

OMAHA, NEB., Oct. 9th, 1883.

"I received the Printing Press in good order, and am much pleased with it. Thanks for the same."

J. W. DAY.

"I have received your paper, also the Dictionary, and I am well pleased with them, the picture alone being worth the price of them all. Please accept thanks for same."

O. B. MCCORMICK, Tidioute, Pa.

MADISON, CONN., Dec. 31, 1883.

"I would like your picture 'Foes or Friends?' very much. I have the steel engraving that you gave before, and like it very much." **S. A. SCRANTON.**

Some OF OUR Latest Books

JUST PUBLISHED.

FLORIDA,

AND THE

GAME WATER BIRDS

of the Atlantic Coast and the Lakes of the United States.

ILLUSTRATED.

With a full account of the sporting along our seashores and inland waters, and remarks on breech-loaders and hammer less guns.

BY ROBERT BARNWELL ROOSEVELT.

CLOTH, 12mo. PRICE, POST-PAID, \$2.00.

Every reader of the *American Agriculturist*, who wishes to know about Florida, or contemplates going there, should not fail to send for this entertaining volume.

AMERICAN

Grape-Growing and WINE-MAKING.

BY GEORGE HUSMANN,

OF TALCOA VINEYARDS, NAPA, CALIFORNIA.

NEW AND ENLARGED EDITION, WITH SEVERAL ADDED CHAPTERS ON THE GRAPE INDUSTRIES OF CALIFORNIA.

ILLUSTRATED.

CLOTH, 12mo. PRICE, POST-PAID, \$1.50.

Mrs. Elliott's Housewife,

CONTAINING

PRACTICAL RECEIPTS IN COOKERY.

New Edition. Revised and Enlarged by the Author.

"For intrinsic worth in a bridal gift I would present my daughter with 'Mrs. Elliott's Housewife' in preference to a casket of valuable jewels," was the remark of a gentleman pre-eminent in the capital of his State; and his estimate of the value of this book to all house-keepers is the same as that of multitudes who have known it in former editions.

Cloth, 12mo. PRICE, POST-PAID, \$1.25.

New American Farm Book.

Originally by R. L. ALLEN.

Author of "Diseases of Domestic Animals," and formerly Editor of the *American Agriculturist*.

Revised and Enlarged by LEWIS F. ALLEN.

Author of "American Cattle," Editor of "American Short-horn Herd-Book."

For the young man of rural tastes, but without a training at the plow handles, who asks for a general guide and instructor that shall be to agriculture what the map of the world is to geography, it is the best manual in print. For the working farmer, who in summer mornings and by the winter fireside would refresh his convictions, and reassure his knowledge by old definitions and well considered summaries, it is the most convenient hand-book.—*N.Y. Tribune*.

Cloth, 12mo. PRICE, POST-PAID, \$2.50.

New and Revised Edition of the SPORTSMAN'S GAZETTEER And GENERAL GUIDE.

The Game Animals, Birds, and Fishes of North America.—Their Habits, and Various Methods of Capturing.—Valuable Instruction in Shooting, Fishing, Taxidermy, Woodcraft, etc., etc., together with a Glossary and a Directory to the Principal Game Resorts of the country.

This New Edition contains entirely new matter in several departments, a newly engraved portrait of the author, new maps, and many fine illustrations representing Game Birds, Game Dogs, Game Fishes, etc., etc. It is a

COMPLETE MANUAL for SPORTSMEN.

By CHARLES HALLOCK,

Founder of "Forest and Stream," and Author of numerous volumes on Out-door Sports.

P. O. Box 289. 31 and 33 Vesey St., New York.

MIXED FARMING IN NEBRASKA.

Grain, Corn, and Live Stock Growing Combined.

The most Profitable and agreeable of any occupation.

1883

Reports prove the agriculturists of Nebraska to have been the most successful of any people in the West.

Write for information about the above matters—also about U. P. Ry. lands in this State, which will be sent Free, in great variety, by **LEAVITT BURNHAM**, Land Commissioner U. P. Ry. Co., Omaha, Neb.

Refer to this advertisement.

Land of Plenty.

Blue Earth, Brown, Watonwan, Martin, Cottonwood, Jackson, Nobles and Murray Counties, in Southwestern Minnesota, have a Wheat crop of over 20 bushels per acre, with Corn, Rye, Oats, Barley, Flax, etc., in abundance such as never before known. Now is the time to buy lands in this most fertile, beautiful and healthful region, which has competing railways, abundant meadows, cheap fuel, spring water lakes and cheap lands.

Apply to **J. H. DRAKE**, Land Commissioner, Drake Block, St. Paul, Minn.

CHEAP FARMS NEAR MARKETS.

The State of Michigan has more than 4,500 miles of railroad and 1,600 miles of Lake transportation, schools and churches in every county, public buildings all paid for, and no debt. Its soil and climate combine to produce large crops, and it is the best fruit State in the Northwest. Several million acres of unoccupied and fertile lands are yet in the market at low prices. The State has issued a **NEW PAMPHLET** containing a map and descriptions of the soil, crops and general resources of every county in the State, which may be had free of charge by writing to the COMMISSIONER OF IMMIGRATION, DETROIT, MICH.

FARMS. 150 Delaware Fruit and Grain Farms cheap. Catalogues free. **A. P. GRIFFITH**, Smyrna, Del.

200 MARYLAND FARMS, in Tracts from 30 to 300 acres. Near railroad and navigable salt water (with all its luxuries) in Talbot Co., Md. Climate mild and healthy. Titles good. 1883 Pamphlet and Map, showing location, free. Address **C. E. SHANAHAN**, Atty, Easton, Md.

"HOME, SWEET HOME." \$10 Monthly Buys Your Own. A NEW CITY.

Where monthly payments double monthly. Several thousand building lots surrounding depot at **Hinsdale City**, adjoining beautiful Garden City and Creedmoor Ridge Range, N. Y., is being sold at \$150 per lot on monthly payments of \$5 each by **R. WILSON**, Attorney, 335 Broadway, N. Y. The prices of unsold lots will be increased \$5 each, monthly, until \$300 per lot is reached. By this method each monthly payment of \$5 is worth \$10 the month following, and by the time a lot is paid for it has doubled its value. Hundreds of cottages will be erected on the property and sold on monthly payments of \$10 for each \$1,000 of cost. This is a safe and profitable way of investing small sums in a spot where climate, drives and surroundings are unsurpassed and where distance to New York is only 35 minutes by rail and commutation only 10 cts. Building optional. Active agents wanted. Circular free. Secure ere next advance.

The Sun

NEW YORK, 1884.

About sixty million copies of **THE SUN** have gone out of our establishment during the past twelve months. If you were to paste end to end all the columns of all **THE SUNS** printed and sold last year, you would get a continuous strip of interesting information, common-sense wisdom, sound doctrine and sane wit long enough to reach from the Printing House Square to the top of Mount Copernicus in the moon, then back to Printing House Square, and three-quarters of the way back to the moon again.

But **THE SUN** is written for the inhabitants of the earth; this same strip of intelligence would girdle the globe twenty-seven or twenty-eight times.

If every buyer of a copy of **THE SUN** during the past year has spent only one hour over it, and if his wife or his grandfather has spent another hour, this newspaper in 1883 has afforded the human race thirteen thousand years of steady reading, night and day.

It is only by little calculations like these that you can form any idea of the circulation of the most popular of American newspapers, or of its influence on the opinions and actions of American men and women. **THE SUN** is, and will continue to be, a newspaper which tells the truth without fear of consequences, which gets at the facts, no matter how much the process costs, which presents the news of all the world without waste of words and in the most readable shape, which is working with all its heart for the cause of honest government, and which therefore believes that the Republican Party must go, and must go in this coming year of our Lord, 1884.

If you know **THE SUN**, you like it already, and you will read it with accustomed diligence and profit during what is sure to be the most interesting year in its history. If you do not yet know **THE SUN**, it is high time to get into the sunshine.

TERMS TO MAIL SUBSCRIBERS:

The several editions of **THE SUN** are sent by mail, postpaid, as follows:

DAILY—50 cents a month, \$6 a year; with Sunday edition, \$7.
SUNDAY—Eight pages. This edition furnishes the current news of the world, special articles of exceptional interest to everybody, and literary reviews of new books of the highest merit. \$1 a year.
WEEKLY—\$1 a year. Eight pages of the best matter of the daily issues; an Agricultural Department of unequalled value, special market reports, and literary, scientific and domestic intelligence, make **THE WEEKLY SUN** the newspaper for the farmer's household. To clubs of ten with \$10, an extra copy free.
Address, I. W. ENGLAND, Publisher, **THE SUN**, N. Y. City.

Jacksonville, Florida.

ARM & HAMMER BRAND

TO FARMERS.—It is important that the Soda or Saleratus they use should be white and pure, in common with all similar substances used for food.

In making bread with yeast, it is well to use about half a teaspoonful of the "Arm and Hammer" Brand Soda or Saleratus at the same time, and thus make the bread rise better and prevent it becoming sour by correcting the natural acidity of the yeast.

DAIRYMEN and FARMERS should use only the "Arm and Hammer" brand for cleaning and keeping milk pans sweet and clean.

To insure obtaining only the "Arm and Hammer" brand Soda or Saleratus, buy it in "POUND or HALF POUND PACKAGES," which bear our name and trademark as inferior goods are sometimes substituted for the "Arm and Hammer" brand when bought in bulk.

BURPEE'S MAMMOTH IRON-CLAD WATER-MELON.

As the introducers of the now celebrated Cuban Queen, we now bring before the public, for the first time, an entirely distinct and most valuable Water-Melon. Burpee's Mammoth Iron-Clad has such decided points of superiority that it will speedily become a popular favorite with all lovers of fine Melons, while for market it is unequalled. The shape is the most perfect; skin handsomely striped; seeds drab-white. The flesh is particularly beautiful, of a dainty red, and more crystalline than in any other Melon. Of most delicious, rich, sugary flavor, the heart is very large, and the flesh next to the rind is fully equal to the heart in luscious taste. The flesh is never mealy; but always firm, remarkably solid. Burpee's Mammoth Iron-Clad grows uniformly to a larger size than any other variety known. Under ordinary cultivation, we have had hundreds of Melons weighing from 60 to 70 lbs. each, and the entire crop averaged 50 lbs. Very vigorous growth, matures early, and is the most productive variety known. The Melons are truly Iron-Clad, and have frequently been dropped from the shoulder of a man, without crushing. The hardness and tenacity is in the outside coating or enameling of the skin. Without exception, Burpee's Mammoth Iron-Clad is the best variety for shipping and keeping.

25 cts. per pkt.; 5 pkts. for \$1.00. Each purchaser is entitled to compete for \$100.00 in CASH PRIZES for 1884.
BURPEE'S GOLDEN-HEART LETTUCE.—Entirely new; most attractive, mammoth, firm heads; delicately curled leaves; beautiful golden-yellow heart, and remains of superb quality for weeks during hottest weather. Pkt., 25 cts.; 5 pkts., \$1.00.
A REMARKABLE OFFER! In order to induce thousands of new customers to give our Seeds a fair trial (knowing, from experience, that they then become regular customers), we make the following liberal offer for 1884:—On receipt of only 50 CENTS, in Postage-Stamp, we will send one packet each of the two rare novelties above-named, alone worth the price, and also one packet each of Burpee's Netted Gem Musk-Melon, sweet as honey, and a gem indeed; Burpee's Imp. Blood Turnip Beet, best; Etampes Cabbage, earliest; Burpee's Surehead Cabbage, all head and always sure to head; Yellow Danvers Onion; New Red Rocca Onion, immense size, mild; Spanish Monstrous Pepper, large, sweet, red; Hollow Crown Parsnip, improved; Perfect Gem Squash, prolific and excellent; Early Long Scarlet Radish, quick growth; Burpee's Improved Long Orange Carrot, best; Purple Top Manich Turnip, earliest and handsome, and Livingston New Favorite Tomato. The above 15 Packets are worth, Retail Value, \$1.50; but we will send the Entire Collection, by Mail, to any address, for ONLY 50 CENTS, or Five Collections for \$2.00.

FOR ONE DOLLAR We will send above Splendid Collection of 15 Varieties, and ALSO One Packet each of the following: Ultra Sweet Corn, sweetest of all; New Telegraph Peas, immense pods, full of large, luscious Peas; Peerless White Spine Cucumber, none better; Imperial Dwarf Large Ribbed Celery, the best; Burpee's Superior Large Flat Dutch Cabbage, the standard; New No. 2 Cabbage, splendid second-early; Veltch's Autumn Giant Cauliflower; Perpetual Lettuce, fine; Large Red Wethersfield Onion; New Giant Yellow Rocca Onion, of most striking beauty, enormous size, and pleasant flavor; Golden Globe Radish, unsurpassed for summer; Salsify, long white; Spinach, new, thick-leaved, round, and Burpee's Chima Tomato, justly so celebrated.
The 30 VARIETIES new and choicest Seeds, as named above, amount to \$2.75 ACTUAL VALUE; but we will mail the entire Collection for ONLY ONE DOLLAR. This is certainly the greatest offer ever made by any reliable Seedsmen. All full-size packets, with illustrations and full directions for culture printed on each. We are ORIGINATORS and not imitators of this plan of placing a valuable Collection of the best Garden Seeds before the public at less than half usual prices. BURPEE'S SEEDS are warranted first-class in every respect, few equal, none better, and we are determined to prove their superiority to all who will try them.

IN CASH PRIZES FOR 1884, to the Growers of the best Vegetables and Farm Products from Burpee's Seeds. Competition open to all. See our Catalogue for particulars. Show this advertisement to your friends and get them to send with you. 8 Complete Dollar Collections (in all 90 packages of Seeds,) mailed for \$2.50. Entire satisfaction guaranteed to every purchaser.
FLOWER-SEEDS. Burpee's GEM COLLECTION of Asters, Balsams, Pansy, Petunia, Phlox, Verbena, Double Zinnia—in all TEN PACKETS—most beautiful varieties, with full directions for culture, for only 25 cts., or, 20 Packets Choicest and most Popular Varieties, worth \$1.25, mailed for 50 cts. The 20 Pkts. Flower-Seed and the 50-Cent Vegetable Collection—in all 35 Packets—mailed for One Dollar—less than 3 cts. a Packet.
SPECIAL INCENDMENT for readers of *The American Agriculturist*. If you ORDER EARLY, we will send free a copy of BURPEE'S FARM ANNUAL for 1884, (price 10 cts.), 120 pages, hundreds of illustrations, with 3 superb Colored Plates, the best and most complete Catalogue of the kind. BURPEE'S ABRIDGED CATALOGUE, with large illustrated circular of WELCOME OATS, mailed free to any address.

Scab in Potatoes.—The Mapes Potato Manure.

DR. F. M. HEXAMER writes in January No. of "American Garden" as follows:

"Extensive experiments with remedies for Potato scab have long since convinced us of the efficacy of some special commercial fertilizers, and although the cause of scab is not positively known, its destructions can in most cases be entirely prevented. Recent experiments in this regard, made by Dr. Henry Stewart, Hackensack, N. J., fully corroborate our own experience. The Doctor writes:

"I have just been digging some of my Potatoes (Early Rose), and send you samples. The clean large one is a fair specimen of some rows manured with the Mapes Potato Manure, eighty feet of row manured with the fertilizer produced one barrel, two and a half bushels. As the rows were three feet apart, the yield is equal to one hundred and eighty barrels, or four hundred and fifty bushels per acre. The other Potato, shown in our illustration, engraved from a photograph, is a fair specimen of those grown with cow and hen manure, yielding a barrel of fair Potatoes to three hundred feet of row, equal to a hundred and twenty bushels per acre. A large quantity, quite a half of this part of the crop, was completely destroyed by wire worms, and not more than half those saved would be fit for sale. Not a Potato, of those grown with the fertilizer alone, is touched by the worms enough to hurt it. I used ten loads of manure to a quarter of an acre, and fifty pounds of the fertilizer to one-eighth of an acre."

"Strong as this testimony is, we do not wish to convey the idea to our readers that we believe Mapes's Potato Manure, or any other fertilizer we are acquainted with, to be an infallible specific against scab. There may be certain conditions in some soils and seasons, which defy and counterbalance its anti-scab properties to some extent. Yet we have never observed an instance in which, when properly applied, it was not productive of decided benefit. The results of recent experiments made at the "Rural Grounds," where 1048 bushels of Potatoes per acre were grown with an application of 600 pounds Mapes's Potato Manure, while unmanured ground under the same cultivation produced but an average of 200 bushels per acre, are especially notable in this regard."

Send for New Pamphlet, containing CROP REPORTS 1883, from truckers, farmers, fruit growers, etc. No charge.

THE MAPES FORMULA AND PERUVIAN GUANO COMPANY, Agricultural Chemists, 158 Front Street, New York.

RICHARDSON'S NEW METHOD

For the Pianoforte.

PRICE, \$3.25.

This standard and superior instruction book does not seem to suffer from the publication of other methods and instructors, however meritorious they be. It sells literally by the Ton! Many times revised, it is practically without error. Those who are in doubt what book to use, are always safe in using RICHARDSON.

Wels' Third Mass. (80 cts.) by Chas. Wels. Just out. Is full of the best effects. Ditson & Co. publish 100 Masses by the best composers. No sacred music is finer than this.

Vocal Echoes. (\$1.00.) By Perkins, and **Collection** (50 cts.) by Morse, are superior collections for Female Voices.

For the Temperance Campaign, now exciting intense interest, there are no better singing books than **Hull's Temperance Glee Book** (40 cents) **Temperance Jewels** (3 cts.) by Tenney and Hoffman; and **Temperance Light** (12 cts.)

War Songs. (50 cts.) are conquering the country. A great success.

Minstrel Songs. (\$2.00.) World Favorite Minstrel, Jubilee, and Plantation Songs.

Gems of English Song. (\$2.00.) As yet unrivalled as a collection of the best English sheet music songs.

(Continued from last month.)

How Watch Cases are Made.

In buying a silver watch case great care should be taken to secure one that is solid silver throughout. The cap of most cheap silver cases is made of a composition known as albat, which is a very poor substitute for silver, as it turns black in a short time. The backs of such cases are made much thinner than those of an all silver case, being robbed in order to make the cap thicker and get in as much as possible of the cheap metal. Another important point in a silver case is the joints or hinges, which should be made of gold. Those of most cheap cases are made of silver, which is not a suitable metal for that purpose. In a brief period it warps, bends and spreads apart, allowing the backs to become loose upon the case and admitting the dust and dirt that accumulate in the pocket. The Keystone Silver Watch Cases are only made with silver caps and gold joints.

St. Louis, Mo., Feb. 17, 1883.
In our long and varied experience in handling watches, we cannot but acknowledge and give our testimony that the Keystone Solid Silver Watch Cases are the best made to our knowledge. Having no soldering they remain homogeneous, harder and stiffer than they would be were they heated for soldering, and have more resisting power against pressure than any other cases in the market. **MERMOD & JACCARD JEWELRY CO.**
Send 8 cent stamp to Keystone Watch Case Factories, Philadelphia, Pa., for handsome Illustrated Pamphlet showing how James Boss' and Keystone Watch Cases are made.

PAYNE'S AUTOMATIC ENGINES.

Established 1840.

Reliable, durable, and economical, will furnish a horse power with one third less fuel and water than any other engine built, not fitted with an automatic cut off. Send for Illustrated Catalogue "B" for information and prices.

AMERICAN RUBBER PAINT.

1870 E. BLUNT, Manufacturer, 115 Maiden Lane, New York.

THE AMERICAN AGRICULTURIST, in an article headed "The American Rubber Paint," writes:

Of late years several substitutes for the ordinary Lead and Oil paint have been introduced. One of the successful ones of this kind is the American Rubber Paint which has been used with satisfaction by some of our associates, and which is as good as any article now in the market.

Greens for Window Blinds, etc. \$2.50 per Gal.

Other Shades, including White and Black. 1.50 "

Roof Paint, Water Proof. 1.00 "

Until further Notice, will allow a discount of 20 per cent on all orders of five gallons and upwards, accompanied by the cash, or will send C. O. D. by Express upon receipt of 10 per cent of the amount, to insure expenses. If after a proper trial the Paint is not all that it is represented to be, I will return the money, or repaint the building at my expense. Send for Sample Colors, Directions, etc.

For Humbug exposures, book reviews, business announcements, etc., see the last pages of the paper.

Kind Words.

Read elsewhere the kind words regarding the *American Agriculturist* from old and new friends.

\$1,000 Reward.

Read the reward offered on another page. It is a matter in which all our subscribers are vitally interested.

Subscribe Now.

As every number of the *American Agriculturist* is complete in itself, subscriptions can begin with any number. Canvassers will bear this in mind. New subscribers can begin with any month and have a complete year from that date.

New and Important Premiums.

See pages in back part of this number for descriptions of new and very valuable Premiums, given to those who secure and forward new subscribers for the *American Agriculturist*.

Microscopes.

Simple and Compound Microscopes as Premiums for schools, scientists, families, farmers, for everybody, everywhere, who secure subscribers for this paper. See full description and details elsewhere.

Spurious Agricultural Journals.

Read in the Humbug columns what is said about certain so-called Agricultural Journals, and how they deceive and dupe the unsuspecting. The Government authorities are after these swindlers.

The Premium Dictionary.

The 600-page Dictionary which we present to every one who sends us a new subscription to the *American Agriculturist* at the regular rate of \$1.50 a year, 10 cents extra for postage, is unquestionably the best Dictionary ever made for new subscribers. Elsewhere we print a few sample replies from those who have received this Dictionary.

A Great Book Offer.

Elsewhere will be found descriptions of four most valuable books, any one of which will be presented to the person who, during the next thirty days, sends us a new subscriber to the *American Agriculturist* (English or German), for 1884, at the regular rate of \$1.50 a year. Such a person can send his own name if he be a new subscriber. Four new subscriptions will entitle the sender to all four of the volumes, post free. Also the Engravings, "Foes or Friends?" and "In the Meadow," 10 cents extra for postage on the pictures—making \$1.60 for all. The four volumes together, make a complete library of reference on matters of daily importance.

Sheet Music.—Make no Mistake.

The twelve pieces of Sheet Music are given as a Premium to every person, who immediately sends us one new subscription (or his own subscription, if new), to this paper for 1884, at \$1.50 a year, and ten cents extra for postage. (See page 83, February number.) No one, however, who receives this Premium, is entitled to the Dictionary or to any other Premium, except the Engraving "Foes or Friends?" which is sent to every subscriber on receipt of ten cents extra for packing and postage. Those who expect to receive the Sheet Music, in writing for it, should send the subscription price and ten cents more for packing and postage, \$1.60 in all, or \$1.70 when the Engraving is also desired.

Do Not Confuse Premiums.

Remember, those who receive one Premium for sending a new subscription, can not have the same name counted for any other Premium.

GARDEN AND

FARM WORK FOR

Engage the farm hands now for the year, and have steady employment for them. Do not let men be exposed in hard, cold rains, at the risk of a long sickness in the busiest time of the year.

Remove the surface water from the fields by trenches, before the ground is deeply thawed, and avoid wasteful washing of gullies. See that the outlets of all drains are clear and working properly.

Get all the seeds ready, and purchase any implements that will be needed later in the season. Have all the machinery of the farm in prime working order, and be abreast of the rush of work as it comes.

Horses feet need constant care during the cold, muddy, spring weather. A daily cleaning of the exposed parts is essential to health.

Cows neglected through the winter, now need careful attention. A warm bran slop, with a little ginger, should be fed daily. Calves may be freed from vermin by a mixture of lard and sulphur rubbed along the back and sides.

Sheep losing wool, may be relieved of the irritation by a mixture of equal parts of sulphur and cream of tartar, given in half ounce doses. Push early lambs forward rapidly, with a little milk from a fresh cow. They quickly learn to feed from a dish.

Breeding sows should be in separate pens, and given warm beds of cut-straw for their young.

Clean the poultry house and sprinkle with ashes or plaster. If lice abound, apply kerosene in small amounts to the perches, from which it will spread to the birds in effective quantities.

Orchard and Nursery.

If an orchard is to be planted, select a plot that will yield a good crop of corn. Plant out the trees and nothing else. Orchard land is abused unless it is given entirely up to the fruit trees. If the trees of an old orchard are good sorts it is useless to re-graft. Manuring and pruning are all such trees need. Nursery trees, when long on the road, often dry out and the bark becomes shrivelled. Bury such trees in sandy soil, root and branch, and in a few days they will become plump.

Buying Trees.—Orders should have been sent to the nurseries before this. Better defer planting until another year than to purchase of the glib-tongued tree peddlers, who will furnish only the refuse of nurseries, impartially named. Order direct from the nurseries.

Do not be in a Hurry to Plant.—Wait until the soil is in proper condition to receive the roots.

Injured Trees.—Branches broken off by heavy loads of snow or by winds should be cut back to the main branch and the wound covered with paint or melted grafting wax. Injury by rabbits and mice is often very serious. If the girdled

trees have any inner bark left on the wounds cover it with earth heaped up against the tree, or better by the use of a plaster made of cow-manure and any stiff soil. Bind on with a piece of old bagging.

Kitchen and Market Garden.

Early Planting requires early plants. The market-gardener depends upon his cold-frames and hot-beds. Every farm-garden or other family garden can provide early cabbage and cauliflower plants, lettuce, tomatoes, etc., by sowing the seeds in boxes of soil placed in the sunny kitchen windows. We have in former numbers described convenient window boxes, but any box that will hold soil will do. Sow the seeds about six weeks before the time at which it will be safe to set out the young plants in the open garden, and gain a month.

Rhubarb.—The acid of Rhubarb stalks is especially welcome in spring. The stalks may be had early by taking up a few roots as soon as the ground thaws; place them in a barrel and fill the spaces with earth. Cover the barrel and let it stand where it is warm. If a new planting is to be made, do it early. Divide an old root so as to leave a bud with each piece. Set the pieces in highly-manured soil, four feet apart each way.

Peas.—The round sorts, while not the best, are earliest and hardest. Sow Daniel O'Rourke or Early Kentish as soon as the frost is out of the ground.

Seeds to be Sown Early, as soon as the soil can be worked, are: Beets, turnips, parsnips, salsify, spinach, kohlrabi, and radish. The following may be sown in seed-beds, to be transplanted: Cabbage, cauliflower, parsley and lettuce.

Things to be thought of.—Nothing helps along in garden work more than a good seed drill. A market garden must have it, and it will pay in a small garden. A line and reel is needed. A good wooden reel is better than a poor iron one, such as is often sold. Repair all implements. Have a good wheel-barrow. It is convenient to mark the handles of hoes and rakes with feet and half-feet. A lance-headed hoe or one like that described in January last, is a most useful tool; any blacksmith can make one. All seeds when sown should be marked with kind and date. Prepare labels; let them be so large that they cannot be hoed up without effort. Secure bean-poles and pea-brush before the trees and shrubs are in leaf.

Green-house and Window Plants.

As the heat of the sun increases the plants will grow with more vigor and present a greater abundance of bloom. The same cause will bring renewed activity among the insects, which will be ready to attack the tender new growth. Fumigation, by burning tobacco stems, if frequently applied, will keep the majority of insects in the green-house in subjection. It is difficult to fumigate window plants, and the best substitute for tobacco smoke is tobacco water. Pour boiling water on the stems, or if these are not readily obtained use cheap plug tobacco. This strong infusion, when used, should be diluted with water until the color is like that of tea. The plants may be sprinkled or showered with this, but the best way to apply it is to have the tobacco water in a pail, or if that is not deep enough, in a keg, and dip the plants in it. Invert the pots, the fingers being over the ball of earth. Plunge the plant and move it up and down in the liquid two or three times; then hold it, still inverted, a few minutes, or until it ceases to drip. For scale insects which often attack ivy, smooth-leaved and other house-plants, apply the kerosene mixture or emulsion, made as described on p. 114.

Annuals that will soon be needed to plant out in the borders may be sown in the green-house or in boxes or pots of soil in the window. Drummond's phlox, stocks, candytuft, asters and others will be needed in abundance. Plants to be set out, from the green-house or window, should be hardened off by gradual exposure, and if need be, pruned into compact form. Propagation of geraniums, verbenas, and other plants to be used in the beds, should be rapidly pushed forward.

A Grafting Knife.

Mr. F. B. Mills, N. Dumbarton, N. H., sends us a sketch of an instrument used in grafting. It can be made from an old razor or file. The broad blade is sharp, and the narrow end is turned and made into a perfect wedge. After cutting the limb to be grafted, split it in the center with the wide

blade, then insert the wedge end in the split, and hammer lightly until room is made to insert the cions. With one light blow the wedge can be drawn without disturbing the cions. For a mallet use a small hard-wood club, like a policeman's billy.

Another Gate with Wooden Hinges.

We herewith give another wooden-hinged gate, in addition to the forms presented in the February

A WOODEN-HINGED GATE.

American Agriculturist. Its simplicity and ease of construction are evident from the above engraving.

Shelter-Screens or Wind-Breaks.

A house upon the open prairie cannot be regarded as complete until it is provided with a screen of trees to break the force of the prevailing winds. While a necessity on the prairies, many exposed dwellings elsewhere would be greatly benefited by the protection afforded by a belt of trees. Besides adding to the comfort of the family, such a screen is a matter of economy in the saving of fuel, an important item in places equally distant from wood lots and coal mines. What is good for man is equally good for his beasts, and in arranging for shelter belts, the barns, stable, sheep shed, piggery and poultry house should be included in the plan. In some localities, not only on the prairies, but near the sea coast, shelter must be given the orchard if fruit is expected, and crops of both the farm and garden will receive great benefit from a tree belt. In affording protection to the whole farm the shelter belt may also be a timber plantation, and the trees selected with a view to their future value as timber. Of course the most complete shelter is afforded by a belt of evergreens, but these grow slowly and it will be a number of years before their full effect will be felt. The shelter afforded by deciduous trees even when bare of leaves is greater than is generally supposed, and while evergreens are planted for the permanent screen, an outer belt of cotton-wood or willow will be of great use. Besides sheltering the house and farm buildings it will incidentally promote the growth of the evergreens by the protection it affords them. As to the evergreens the question will be, "What trees shall we plant?" If the intending planter lives where native trees may be had within an easy distance, he may get his trees with little outlay by taking up young seedlings of Arbor Vitae, White and Black Spruce, White Pine or Hemlock. Some evergreens transplant more read-

ily than others, but with all, it will be safer to plant the young trees closely in rows, and let them remain for a year before planting them permanently. Those that survive the first year will be quite sure to live when planted in the belt. If trees are to be bought, the Norway Spruce easily stands first for this use. Its rapid growth, hardness, the complete shelter it affords, and its value for timber are all in its favor, while the ease with which it is raised from seeds allows it to be sold at a low price. Some nurserymen offer young seedlings of this and other evergreens so small that a hundred can go in a package by mail. These, if set out in rows and grown for a few years before they are planted permanently, will afford trees for the screen at a very small cost. The benefits of the wind-break may be experienced many years sooner by purchasing larger trees. The native trees mentioned above may be had from the nurseries. The Austrian and Scotch Pines are also useful for shelter. In planting the Norway Spruce in a single row six feet apart is the usual distance. It is better to plant in two rows, setting one with the trees ten feet apart, and ten feet from this another row, with the trees opposite the spaces between those of the first row. Two rows are enough for a screen, but if more trees are to be planted for timber, other rows may be added, the trees in which should alternate in the same manner.

Pruning Evergreens.

It is not very long ago that people supposed that to cut an evergreen was to surely kill it. Later experience has shown that these trees, when necessary to bring them into shape, may be pruned like any others. The pruning of evergreens has sometimes been greatly abused by cutting off the lower limbs and presenting a monstrosity which some one has compared to "a hay-cock upon a stump." The natural form, when an evergreen has room to develop, is that of a cone, with its lower branches resting upon the ground and forming a beautiful pyramid of green. Instead of cutting away the lower branches, the better way would be to apply the axe to the trunk, and be done with it altogether. Evergreens so generally take a perfectly conical shape that pruning is only needed to preserve that form; when a branch grows with unusual vigor and threatens to destroy the symmetrical shape, it should be cut back. To avoid all appearance of mutilation, make the cut upon the under side of the branch, and sloping toward its end. The shape of evergreens may be controlled with very little cutting, by a proper pinching out of the buds which by prolonging would form branches. In short, the pruning of evergreens presents very little difference in treatment from that required by a deciduous, fruit, or an ornamental tree.

An Old Saw Cutting Weeds.

This is the season to prepare implements, etc., for the busier days. Mr. "E. E. B.," a subscriber in Prince Edward's Island, sends us a sketch of the method of turning part of an old saw-blade to good account as a home-made weed-cutter. A piece was cut off, four by six inches, and four holes made through it, as in figure 3. A pronged iron or steel

Fig. 1. Fig. 2. Fig. 3. Fig. 4.
PARTS OF THE WEED CUTTER.

piece (fig. 4) is then riveted on and driven into an old rake handle. Grinding the edges of the steel blade completes a good garden tool that can be made in a very short time with little or no expense. It is very convenient for destroying weeds, especially those between narrow rows, and the hours saved in weeding will fully compensate any garden worker for the cost of this implement.

A Remodelled Barn.

ALFRED H. GLOVER, SAGINAW CO., MICH.

The old barn, figs. 1 and 2, was thirty-four feet by forty-eight feet, with sixteen-foot posts, and built the usual way with four bents. The threshing floor was twelve feet wide, with the stables on one side and hay-mow on the other. There was a shed in rear of barn, twelve by thirty feet. The sills of the barn rested on oak blocks, about one foot above the ground. In remodelling, the main building was raised two feet from the ground, a stone foundation one foot thick being laid all around, and extending two feet into the ground to be below frost. The threshing floor was raised two feet above the sills, and the ground excavated two feet under it. Cross-walls were then built, making a cellar twelve by thirty-four feet, and six feet high. There are two small windows

Fig. 1.—FRONT AND END VIEW OF OLD BARN.

in front, and a door in rear of cellar. A foundation, similar to that under main barn was then built for a wing thirty-four feet wide, and extending three feet back from main barn. The wing is same height as the barn, with roof hipped into main roof, and a ventilator built in the center of roof, as seen in figs. 3 and 4. The old shed was moved to rear of the wing, and continued around each way fifteen feet on each side of wing, as seen in figs. 4 and 5. A new shed was built on each end of the main

Fig. 2.—GROUND PLAN. OLD BARN.

barn, twelve by twenty-four feet, open in rear, the lower part for manure, and the upper part for bedding, as shown in the figures 3, 4 and 5. The stables are twelve by twenty feet, with stalls for four horses and five cows. An alley four feet wide runs along in front of mangers for feeding. At the front end a door opens into the granaries. A harness room four by fourteen feet is convenient to the horse stable. A box stall, nine by fourteen feet, next to cow stable, is used for cows with calf. An entrance way closed by a gate, allows

Fig. 3.—REMODELLED MAIN PART WITH SHEDS.

access from stables to threshing floor. Floors over stables, granary and threshing floors, admit storage of unthreshed grain or hay. At the front of the barn is a sliding door with a large window in it for admitting light and air. The walls of granaries are made of two by four scantling, laid flatways one on top of another. Stables and

granaries are eight feet high. The whole remodelling barn is painted red with white trimmings.

Materials and Cost.

Sills 6 by 8 inch, two 30 feet long, and four 34 feet long=784 feet; sills for sheds, 6 by 6 inch=606 feet; posts 8 by 8 inch, six, 16 feet long, and three 12 feet long=704 feet; girts, 6 by 6 inch, two each of 18, 17, and 12 feet long=282 feet; plates, 6 by 6 inch, two 40 feet, and two 34 feet=144 feet; three beams, 6 by 8 inch, 34 feet long=108 feet; thirty-five joists, 12 by 2 inches, 18 feet long=1,260 feet; scantling, 2 by 4 inches, for sheds, etc., 5,000 feet; rafters, thirty-two, 2 by 4 inches, 22 feet long=102 feet; planks for floors and bridges, 4,200 feet; Total timber, 14,000 feet, \$15 per 1000 feet...\$210.00
Shingles, 20,000, @ \$3 per 1000...60.00
Roof boards, 7,000 feet, and battens, 704 feet, @ \$10...77.00
Windows, nails and trimmings...50.00
Carpenter work, \$150; painting \$75...225.00
Excavation 60 yards, @ 20c. per yard...12.00
Stone for foundation, 1,500 cubic feet @ 6c...90.00
Total cost of Remodelled Barn...\$784.04

Basket Willows, Osiers and their Culture.

Every few years there is an excitement concerning willow culture, and our correspondence shows that one of these periods is at hand. We answer a number of inquiries by saying that willows, of the finest kinds, can be grown in this country. Every cultivator of experience is aware that producing a crop is often easier than selling it. In considering a new culture the disposal of the product must be taken into account. If one has a crop of willows how

can he sell it? Willows are in demand by a very small class of operatives—basket-makers. Nearly all the basket-makers are from Europe, and have their prejudices in favor of their former homes. When the dealers in willow tell them that good basket material cannot be produced in this country they are ready to believe it, and the importers, by refusing the American product at any price, have almost a monopoly of the trade. This state of the willow trade cannot long continue. There are several parties having willow plantations who are bound to sell their productions. Finding that the importers will not take their material they put up the rods in the usual bundles and send these like any other product of the farm and garden, to some city commission house. The bundles being exposed for sale are seen by city basket-makers, the best judges of the material, who examine and buy. Thus the exclusiveness of the importers is gradually broken down; a few cents less in price is an argument that the basket-makers can appreciate. The two centres of the willow industry at present are Hartford, Conn., and Syracuse, N. Y. A Manufacturing Co., at the former place, finding that their estate was being washed away by the river, planted willows very largely, in order to preserve the river bank. Finding themselves with a large willow plantation on hand, the company imported a number of basket-making families to use up material that would otherwise go to waste, and a prosperous village of basket-makers was established. The great variety of willow-ware sent from this establishment is a sufficient answer to those who assert that the finest stock cannot be grown in this country. At Syracuse some Germans several years ago, planted willow and worked it up into baskets; the industry rapidly increased, more families came, more acres were planted and more baskets made. At present there is a prosperous community, with hundreds of acres in willow and their annual sales of baskets now amount to thousands of dollars. That willows of the best kinds can be produced in this country there is not the least doubt, but with this as with all unusual crops, we advise no one to undertake it until he has made sure that he can dispose of the produce. Because some willows grow in swamps, many think that they can only be successfully cultivated on wet land. This is a mistake; any land in good condition for a corn or other farm crop is better for willows than wet soil. While the term osier is often applied to any willow grown for basket-making, the willow known as the Osier is one of the coarsest and poorest. The desirable kinds of willows and manner of planting them, etc., may be given another month.

Greens from the Fields and the Garden.

The desire for green vegetables in spring is not a mere whim of the appetite, but a demand of nature for something the system needs. Farmers, especially those at a distance from markets, live largely upon salted meats. Experience has shown that the continued use of such meats induces scurvy and other disorders unless their bad effects are offset by an abundance of fresh vegetables. "Corned beef and cabbage" is not a combination made to please the palate, but one that meets a want of the system. Cabbages, beets, turnips and other vegetables are used during the winter to ward off the ill-effects of daily salt meats, but with the advent of spring the desire for vegetable food becomes stronger, and is best satisfied by "greens," as various plants are called, the leaves of which are eaten. The majority of these plants grow wild, and the boys are sent to gather dandelions in the

Fig. 4.—ELEVATION OF REMODELLED BARN.

field, marsh marigold (often, but incorrectly called "cowslip") from wet meadows and the brookside, the shoots of poke-root and nettles from the roadside and fence corner, and a number of other wild plants. It would be better to have a supply of greens in the garden, as aside from the great waste of time in hunting for them, the wild plants having to struggle with many others, are tougher and not so well suited for food as those from the richer soil of the garden. To have the earliest greens from the garden, preparation must be made the fall before, by sowing spinach and kale to be wintered over. Dandelion seed is sown in spring, as it needs a whole season's growth before it will afford a cutting. The earliest greens to be had from the garden, in the absence of those kept over winter,

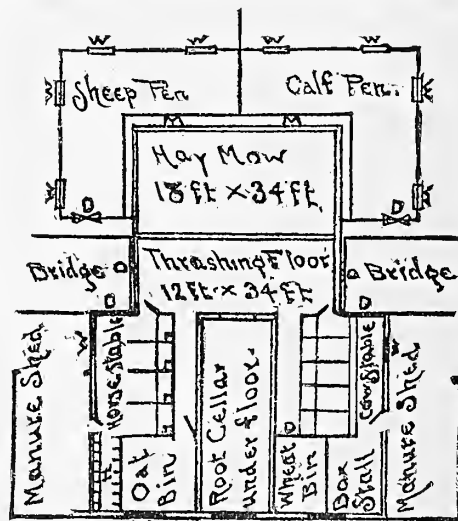

Fig. 5.—GROUND PLAN OF NEW BARN.

are afforded by cabbage sprouts. The modern method of wintering cabbages, by inverting the heads and covering them with earth, is well for the heads but the stumps are killed. Where cabbages are wintered in a cellar or by setting them upright in trenches, the stumps are saved and are almost as valuable as the heads. The stumps should be set out as soon as the ground has thawed, planting them six or eight inches apart. They will soon push numerous tender leafy shoots which should be cut when two or three inches long; they will afford several successive cuttings. Turnips may be

treated in the same manner. As soon as the soil can be made fit for the seeds, sow spinach in rows fifteen inches apart, and at intervals of a week until the middle of May. Beets may be sown in the same manner, especially for greens, or they may be thinned, leaving a part of the seedling beets to form roots. By proper management the farmer can provide a daily supply of greens.

Preparing Corn Ground in the West.

Over a large part of the Western prairie regions corn is by far the most important crop. Except for the first two or three years after the sod is broken, it is the most certain, and the most remunerative. There is no way to ensure a crop the same year the ground is opened. But when breaking is done quite early, as soon as vegetation starts, and the seed is put in the sod with a spade, or better with a horse-planter having a "sod attachment," a moderate crop may frequently be obtained. On certain soils, and in wet years, sod corn sometimes yields thirty bushels per acre; but this cannot be counted on with certainty.—A much surer way is to break the sod as usual, and follow the breaking plow with a smaller stirring plow which throws up a strip from the bottom of the first furrow. This subsoil can be torn to pieces with the harrow to form a good mellow surface bed. Corn planted in this way, with a planter, will yield an average crop without any cultivation. In hot, moist seasons the yield will be larger.

In preparing land for corn farmers differ in opinion as to whether it is better to gather and burn vegetable rubbish, corn stalks and the like, or to cut it up with a stalk cutter and plow it under. The latter urge that the stalks and stubble covered by the plow enable the land to stand drouth better and that rotting in the ground they help to increase its fertility. The former argue that this rubbish furnishes harbor for insects during winter, and that burning the trash kills large numbers of these, and destroys many seeds of weeds. It is claimed, too, that some of the stalks which are plowed under remain near the surface and interfere with the regular operation of the planter, the runners rising nearly or quite out of the ground when passing over them, and then dropping too deep for a time.—Where the listing machine is used it is absolutely necessary to rake and burn all trash on the surface. Some readers of the *American Agriculturist* may not be acquainted with this peculiar machine for planting corn. It looks like a right and a left-hand plow with the landsides placed together, forming in fact a stout shovel plow. It is usually drawn by three horses and throws up a furrow on each side. Just under the inside is a sort of miniature subsoil plow, or stirrer, which tears up and mellows the soil in the bottom of the furrow. In the machines most used about here the planting apparatus is separate from the furrowing part, and follows after it, drawn by a different team; but sometimes they are united in one.—Farmers differ as to the merits of the two methods. The truth seems to be that in warm, dry springs, on land free from trash the combined implement works admirably, especially for late planting after the ground becomes warm, since it allows the plowing and planting to go on together. It is by all odds the cheapest, as two men with four horses will, with the combined implement, plow the ground and plant five to seven acres of corn per day.

In Nebraska and Kansas there is some difference of opinion as to the comparative advantages of fall and spring plowing for corn, with a large preponderance in favor of the former. When land is moist enough in autumn to plow well, it is usually if not always best to plow it then; but if so dry that it cannot be well plowed, leave it until spring.

Whether the plowing should be deep or shallow depends upon the kind of soil. On deep, black soft loams, corn roots will penetrate as readily into the subsoil as into the plowed portion, and little is gained by stirring it, though an occasional deeper plowing, even in soft loamy soil exposes fresh portions to the atmosphere, and develops more

plant food. For stiffer subsoils, packing easily, it pays to plow deeper to pulverize and aerate them.

Where deep plowing is the rule, its advantages will be most striking in dry seasons. In 1874, a very dry year in Nebraska, there were in Sarpy County two corn fields, side by side, each containing about sixty acres. The soil was the same, plowed and planted at the same time, and cultivated substantially alike except that one was plowed seven to eight inches deep, the other three to four. The former yielded about forty bushels per acre, the latter showed only an occasional ear, and yielded not over six or eight bushels per acre. Taking one year with another, on all prairie uplands, it is safe to plow pretty deeply. Yet it must be admitted that in some cases good fair crops of corn have been raised by planting between the old corn rows, and not plowing the ground at all.—For fall plowed ground it is frequently necessary, and always desirable, to cultivate it before planting. This is usually done with the common four-shovel corn plow. The pairs of shovels are spread as far as possible apart, and on returning, two shovels are made to run between the marks made going the other way, and the other two run outside, thus stirring all the ground. This cultivation keeps down weeds until the corn gets a start, and loosens up the surface soil so that it warms better and starts the corn sooner. After thus cultivating, it pays to harrow once across the cultivator marks, and many good farmers roll before planting.

All of these things take time, and many are impatient of anything but the shortest and easiest way. Now it is possible for a smart man with a good team and implements to plow the ground, plant, and cultivate an acre of corn with one day's work of himself and team, thus: fourteen acres of land can be plowed in six days, and planted in one day, with a two-horse plauter and cheek rower; harrowing once, one day; cultivating first time, two and a half days; other two times, three and a half days, making just fourteen days in all. It is conceded that there would be more profit in giving more time to it and doing the work better.

Shelf for the Stable Dog.

A good dog about the stable is very desirable, and the writer is confident he has saved many dollars by keeping one. It is not fair to let him sleep just where he can find a place to lie down, while a dog-house is apt to be neglected and be infested with vermin. To afford the dog a chance to be

cleanly and comfortable, make him a shelf or platform of one inch pine, planed, two feet wide by three feet long, or according to his size. Tack a two-inch cleat around three sides of it, projecting an inch on the upper side. Put this up securely where it will not be too much in the way, but will still be in sight of the main entrance to the stable. If not in a corner, it can be supported in front with two by one inch pieces, as shown in the engraving. Twelve to eighteen inches is a convenient height from the floor. A good thick mat, soft and clean, or even a piece of carpet, should be provided, and the dog can very soon be taught to lie there and keep an eye on his master's property. D. Z. E.

Bee Notes.

BY W. Z. HUTCHINSON.

VARIETIES OF BEES.—The good qualities of the Italians are: amiability, industry, length of tongue, and the masterly manner in which they defend their combs from the bee-moth larvæ. Their undesirable traits are: persistent clinging to the combs when an attempt is made to dislodge them, indisposition to enter surplus receptacles, and their manner of filling the cells so full of honey that it touches the cappings, which gives to the combs a dark, watery appearance.—The Black or German bees are superior comb-builders, their combs are straight and true, and are snowy white on account of the empty space they leave under the cappings; they readily enter the surplus department, and they can be easily shaken from the combs; while their unpleasantly irritable nature, and their unprofitable habit of not storing very much surplus unless the pasturage is excellent, are certainly undesirable characteristics.—The Syrians, which have lately been introduced, have no valuable qualities not possessed by the Italians, while they have the additional bad ones of extreme viciousness, prolificness, and of not properly ripening and sealing the honey. It may seem surprising that we should consider extreme prolificness undesirable. It is valuable to the man who rears bees and queens for sale, but not to the honey producer, who looks to the quality rather than to the quantity of his bees. The Syrians breed from early spring until late in autumn, never stopping so long as a drop of honey remains in the hive; while their main object in rearing bees appears to be that the bees may gather honey with which to rear more bees. Their philoprogenitiveness is greater than their acquisitiveness.—For producing extracted honey, the dark, leather-colored Italians have no superiors, but the producer of comb-honey who ignores the good qualities of the German bee, does so at a loss. In short, the best bee for producing comb honey is a judicious cross between the dark, leather-colored Italian and the brown German, or so-called "black bee."

QUEENS ENTERING THE SURPLUS DEPARTMENT.—Many bee-keepers, when working for extracted honey, have been troubled by the queen entering and depositing eggs in the section boxes, or in the combs of an upper story. To remedy this, zinc honey boards have been used, perforated with holes of such a size as to allow workers but not the queen to pass through. The principal objection to these honey boards is their expense; and one bee-keeper the past season successfully substituted slats of wood placed near enough together to exclude the queen but not the workers. These cost only a third as much as zinc.

LABELS.—A neat, attractive, but small one is best for glass packages. When honey is put up in tin there is some excuse for adornment with labels, but even then highly colored, flaming labels give too much of a tin-can, bar-soap, groceryified appearance. Leave the gaudy "chromos" to the packers of fish, fruit and vegetables; the product of the apiary requires nothing of the kind; it is beautiful in itself. "Beauty unadorned is most adorned."

STRAIGHT COMBS WITHOUT SEPARATORS.—Separators, that is, sheets of tin introduced into the surplus department of hives to insure the building of straight combs, are being discarded by many of the leading honey producers. Had sections been made narrower when first invented, and had the "glassing" of filled sections never been in vogue, probably separators would have remained unused. Sections an-inch-and-a-half wide, instead of the usual two inches, are the

best width for obtaining the straightest combs without separators. They can be one-fourth inch wider, and cratale combs be received upon three conditions, viz.: if the sections be filled with comb foundation (preferably that made on a press) excepting one-eighth inch at each side, and one-fourth inch at the bottom; second, if the hives stand level, at least in a direction at right angles with the combs; and third, if Black or German bees, or at least those having a dash of German blood, do the work of filling the comb.

Fancy Points in Fowls and Cattle.

A writer in an English journal comes out very strongly against fancy points in fowls. Thirty years ago, he says, they had abundance of eggs and the best of table fowls; now nothing like equal to them, all in consequence of the folly of judges at the poultry shows, getting up absurd "Scales of Points," which the fowls must carry, even to a feather, or fail of winning a single prize.—The superb Dorking is turned from a luscious table fowl into a dark-plumaged, thick-skinned moulrel, scarcely fit to eat. Time was when their colors were pure white, or gray, or handsomely mottled by various colors. In breeding a purely white face the noble full-breasted Black Spanish has dwindled from ten or twelve pounds in weight to such a miserable size and shape as to make it a profitless bird, unworthy a place any longer in a good poultry yard. The Game fowl has been robbed of its fine round full flesh, and given long stilty legs; the Hamburgs are bred down in size and egg-laying propensity. The greatest production now of the formerly grand Brahmas is feathered legs and vulture hooks. People do not eat plumage, and yet in the Brahma, flesh and size have been sacrificed to a feather.—This reminds us of the ridiculous efforts of a few Western Shorthorn Cattle breeders, who endeavored some years ago to make a dark deep, red color the criterion of the choicest of the breed, totally ignoring pure white or patched with red, and the most beautiful of all the colors, a rich strawberry roan. Some Jersey breeders at the same time strove to make solid colors, with black points, tongue, and tail switch, the things to be coveted. Happily both parties have been snubbed, and a Shorthorn continues to be judged as in the origin of fitness for the improvement, by its form, capacity for the dairy and shambles; while the butter test now rules among the Jersey breed.

Four Good Stanchions.

In figure 1, the latch, *e*, is one foot long with one end fastened by a screw or bolt. To release the

Fig. 1.

animal the end is raised as indicated by dotted lines. The latch shown in figure 2 works in the same way, only the latch is secured to the upper

Fig. 2.

end of the swinging standard, the opposite end fitting or falling into the notch cut in the upper

part of the rail, *s*.—Figure 3 represents the simplest form possible, in which a wooden pin, *p*, secures the swinging standard in position. The stanchion given in figure 4 is more expensive than the others. A piece of iron or even stout wire, is bent in the form of the letter U, as at *l*, the ends being secured

Fig. 3.

to each side of the rail by screws or even by nails. The animal is released by raising the free end of the bent iron. The top of the swinging standard

Fig. 4.

projects above the rail about an inch-and-a-half, and is made slanting towards the animal so as to be self-fastening when moved into its position.

Agricultural Experiment Stations.

W. E. STONE.

About the beginning of this century, an interest in all branches of agricultural science began to engage the attention and offer an inviting field to investigators. The increasing population, and the decreased fertility of exhausted soils, indicated to thoughtful minds the necessity of inquiry, and a search for remedies; and in successive years Priestly, Lavoisier, Liebig, Boussingault, Lawes and Gilbert, and numerous others, studied agricultural questions in a scientific manner.—In 1851 the first Agricultural Experiment Station was founded in Saxony by a society of farmers. Its value became so apparent at once that it was recognized by the Government, and others soon followed, until now there are one hundred and thirty stations in Europe, eighty in Germany alone. But with this enthusiasm in Europe, progressive Americans were long at a stand still, owing chiefly to an essential difference in our agricultural system. Our lands were broad and fertile. Though some on the eastern seaboard were showing loss of power, it was easier to draw on virgin soil than to redeem the old; and only when the exhausted acres reached an important proportion of the whole, did we begin to listen to the claims of agricultural science.

In 1876 the first Agricultural Experiment Station proper, in the United States, was established at the Wesleyan University, at Middletown, Connecticut, after much earnest effort by intelligent farmers, by the aid of a small appropriation by the Legislature, stimulated by a liberal donation from a philanthropic citizen, and the free tender of college laboratories, etc. Its success and usefulness were so manifest that larger annual appropriations were provided, and the Station, accepting the proffered appliances of the Sheffield Scientific School of Yale College, has now buildings and lands of its own in the suburbs of New Haven.—In 1877 North Carolina provided a Station now in operation at Raleigh.—In 1880 the New Jersey State Station was started in connection with Rutgers' College, at New Brunswick, near which is the State Experimental Farm.—In 1881 the New York Legislature provided for an annual appropriation of Twenty Thousand Dollars for an Agricultural Experiment Station, which began work at Geneva in 1882. It is the best equipped one in this country.—In 1882 Ohio founded a Station at the State University at Columbus. The

same year Massachusetts incorporated a Station that began work in July, 1883. These comprise the public Agricultural Experiment Stations of our country. In addition, most of the Agricultural Colleges carry on some special line of investigation. The only station in the United States supported privately and yet conducted on scientific principles, is that at Houghton Farm, Orange County, N. Y., established in 1876. This briefly is the history and present status of organized research in agricultural science in the United States.

The work so far accomplished has been as good as could be expected from Stations meeting and surmounting the first obstacles of organization. There have been completed a large number of chemical analyses of fertilizers, feeding stuffs and miscellaneous articles, and seed testing has received a good degree of attention. At the New Jersey Station feeding experiments have been prosecuted, and at Houghton Farm especial attention has been paid to the corn crop in its relation to fertilizers, to the study of agricultural physics, and the diseases of fruits.—Much allowance is to be made for the youthfulness of our institutions; it has taken Lawes and Gilbert thirty years to collect the valuable data which places the Rothamsted Station ahead of all others; and in all work of this kind, averages of a large number of experiments are sought, rather than isolated trials. In the work in progress at our Experiment Stations we are of course yet far behind what is being done in Europe. There, questions are treated in the most elaborate and exhaustive manner; year after year is devoted to the study of a single subject by the most scientific and thorough methods, and from every possible point of view. Take the work done at Rothamsted; observe how accurate and painstaking the records, how careful and thorough each step, and finally how cautiously the deductions are drawn. We have nothing equalling or approaching this. Most of our work, thus far, has been superficial and at random; not poor, but quite the contrary, and answering the requirements; but the time has come for something different, for a step upward. It is now a settled fact that we can support Experiment Stations and appreciate their work; it is therefore so much the more important that we raise them up and make their work of the highest scientific value. Hitherto their support has depended much upon the popular voice, and the Directors felt bound to appeal to popular feelings by a kind of work easily comprehended and "taking," but in nine cases out of ten almost devoid of scientific or economic application, such as seed testing and chemical analyses—excellent and very necessary work so far as it goes. Its effect in restraining the cupidity of dealers in fertilizers and seeds is of immense value to farmers; but it discovers few new facts, and contributes very little to the science, and will be of small value after the expiration of a single year. True, not all the Stations confine themselves to such work; the feeding experiments at the New Jersey Station, and those just instituted in Massachusetts, with the work in agricultural botany in New York, are noteworthy exceptions. But the standards will continue low until the people acquire new views. They need a certain familiarity with scientific methods, and to learn to appreciate the value of a single fact systematically sought and proved, in comparison with a mass of superficial experiments. But there is a constant tendency in this direction, and its attainment is simply a matter of time. Meanwhile the directors of stations can do much to lead public thought by a strict adherence to scientific principles. Those who bid for popular applause build on sand. Time is the test of value; how little of the work so far done at American Stations will be quoted ten or twenty years hence as is that of Liebig or Lawes and Gilbert. A private institution like Houghton Farm has the advantage over public ones in being free from all outside influence, and privileged to take up special kinds of work, requiring years perhaps for their completion, but safe in the consciousness that the annual report is not obligatory, and the necessary funds are not dependent upon the degree to which popular sentiment is played upon. The Rothamsted Station

leads all others to-day because its work has been persevering and continuous in direct lines, although it has taken many years to bring it to a point where it could be appreciated by the public.

With the adoption of more scientific methods and higher standards, will come the necessity for Special Stations dealing with special questions only. This they have already attained in Germany, and certain Stations analyze fertilizers, others test seeds, and some conduct feeding experiments, and as a natural consequence of this division of labor the most valuable results are attained. Thus far our Stations have no common meeting ground. A kindly interest in each others' labors exists, but there should be something more. Individual organization should be supplemented by a collective one. The German Stations publish a bi-monthly journal containing a digest of their work and serving as their official organ. A similar journal is needed in America as an incentive to a better work, as well as a valuable record of important results.

Feeding Cattle.

Some Notes from the Experimental Department of the Nebraska Agricultural College.

Looking over the experimental work of the past year, some points are suggested as likely to be of interest to the readers of the *American Agriculturist*. 1.—Two steers—40 months old when put up—were fed all the corn and hay they would eat for 215 days. Their only shelter was a shed open to the south. Up to the beginning of the experiment they had been fed only hay and grass, no grain. During the 215 days they ate nearly two tons of prairie hay each, and 81.6 bushels of corn. The two steers together, gained on an average of 1.78 lbs. per day, and 4.59 lbs. for every bushel of corn consumed. The percentage of gain on live weight was 27. At the end of the experiment one weighed 1,835 lbs., and the other 1,675. At the same time a number of steers of the same age were fed on a farm adjacent to the College in the same manner, except that they had no shelter, and received about 30 lbs. of ensilage (of corn), daily, instead of hay. On an average these steers gained 50 lbs. more than those of same age fed with hay. The ensilage seemed to make the corn more digestible, so as to enable the animals to accumulate flesh faster. Two other steers of same general appearance, but one year younger, were fed under same circumstances and conditions as the two first mentioned. During 174 days they ate 74.8 bushels of corn, gained at the rate of 2.12 lbs. per day, or 4.96 lbs. for each bushel of corn consumed, and gained 38 per cent of their weight when first put up. One weighed 1,400 and the other 1,250 at the end of the time. The heavier one gained 425 lbs. in 174 days, or 2.44 lbs. per day, the other gaining 110 lbs. less in the same time. Allowing, as we may safely do, that the pork made by the hogs that followed the steers paid for the hay consumed, this steer paid a handsome profit for feeding. It cost \$39.00, and sold for \$77.00, a gross profit of \$38.00. Dividing \$38.00 by 74.8 (the number of bushels of corn consumed), gives 50 cents as the value received per bushel for the corn. The other steer of the same age, returned only 42 cents a bushel for the corn consumed. Such a calculation shows the importance of selecting good steers to feed, and at the same time the difficulty of doing this. These two were both half-blood Shorthorns, sired by the same bull, reared in the same way, and very much alike in general appearance. Yet with corn at 40 cents a bushel, one animal would barely return expenses of feeding, while the other would pay a fair profit on each bushel consumed.

Two yearling Shorthorns were fed during the same 174 days as the two two-year olds. These ate 60.4 bushels of corn each, gained at the rate of 1.89 lbs. per day, or 5.43 lbs. of beef, live weight, for each bushel of corn consumed, and gained 43 per cent of their live weight when put up. Though they gained less in the aggregate than the older ones, the gain per bushel of corn consumed, 5.43 lbs., to 4.59 lbs. for the three-year olds, almost a

pound more per bushel. Making the same calculation as in the other cases, we find that these one-year olds cost \$61.60, and sold for \$121.00, giving a total profit of \$59.40. Dividing this by the number of bushels of corn consumed by the two (120.8 bushels), shows that the corn returned 49 cents a bushel. This average is nearly as good as the best of the two-year olds, and three cents a bushel above their average. Another circumstance about these younger steers deserves mention. During the month of May, when all the steers were fed coarse meal instead of ear corn, one of these yearlings gained 85 lbs., and the other 110 lbs., an average of 97.5 lbs. in 32 days, or over 3 lbs. a day. During this month, while the yearlings gained 195 lbs., the two-year olds gained 105, and the three-year olds just 10 pounds. This seems to indicate—that if the year-olds had been fed meal the whole time, the gain would have been greater. It will be observed in regard to all these steers, that they had never been grain-fed until the experiment was begun, but had made their growth on grass and hay. No such increase per day, or in the aggregate, could be made upon three-year olds well fed from youth up. Gillett's steer, Mammoth, weighed 2,250 lbs. at 24 months, gained only 200 lbs. the next twelve months, and actually lost 5 lbs. the next four months, just preceding the Fat Stock Show of 1883. All the possibilities of profit were gone when the steer was 2½ months old. Indeed, the total increase of live weight the next 16 months, cost something like 50 cents a pound. These steers, fed at the College farm, were purposely kept and fed in the manner common among feeders in this State. It is a rough kind of a way, but steers accustomed to out-door life, never stabled or handled until they are put up to feed, do not take kindly to stables and confinement. The great number of those feeding cattle in this State, are not unable to build barns to accommodate them. Indeed, many stock-raisers of long experience, believe it better to feed steers in a dense grove, situated in a sheltered place, upon dry ground, than in a barn.

Weed-Killing Clod Crusher.

Mr. J. J. Rogers, New Dungeness, Clallam Co., Wash. Ter., sends us sketches of what he calls a home-made "Clod-crusher," but, as will be noticed, he uses it much as a weed-killer. Two strong planks six feet long, six inches wide, and two inches thick, are notched as shown in fig. 1, and set four feet

Fig. 1.—VIEW OF SIDE AND PLANK.

apart from their centres. Three planks five feet long, six inches wide, and an inch and a half thick, are spiked on to these, cross-wise, as shown in fig. 2. The angle at which they are set is not stated, but for ordinary work we suppose forty-five degrees would be about right. Perhaps on some ground they may need a greater pitch back to pre-

Fig. 2.—THE CLOD CRUSHER.

vent scraping the soil forward. An elevated seat for the driver stands on legs let into the side-pieces about the middle or a little back of it, so as to throw the entire weight evenly upon the three scrapers.

Mr. R. writes: "This clod-crusher, made by myself six years ago, is the first I ever saw. Now no farmer here could do without one. We run it over grain as soon as it is harrowed in, and use it upon potatoes when they begin to show through the ground, first running the common spike harrow over them. This covers most of the potato tops with earth, while it pulls up and kills every weed that may have started. In a few days the potatoes will be above ground again, large enough for the cultivator, clean of weeds even in the foulest ground. It saves more than half the cost of raising potatoes here. Of course the riding or the weight of the rider, will depend upon the condition of the soil. On light ground, too much weight would pull up some potatoes. I am aware farmers in my native place (Chester, Pa.), think this treatment may ruin their crop, but a trial would convince them of their mistake.

Fastening for Barn Doors.

Mr. "J. H. B.," Port Huron, Mich., sends us a description of a plan for fastening large barn doors.

FASTENING FOR LARGE BARN DOORS.

Use an upright bar, two by four inches, for each door, held in place by a piece of iron three-eighths by three-quarter inches, bent so as to include the upright, with room to move it past the wedge by which it is held on to the cross-bars of the door, at the top and bottom. The upright reaches from the floor to the beam over the doors, and is held in place by driving a heavy nail or bolt into it. Just above the iron bar that holds it in place, a piece of hard-wood is fastened to the floor, and also one to the beam above, so that when the door is shut and the upright moved toward the edge of the door, the latter is drawn perfectly tight, and cannot warp or get out of place. Either door can be shut and fastened independently by this method.

The Propagation of House Plants.

Nothing about plant culture is more fascinating than the multiplying of plants from cuttings. It is the making of a new plant, and one takes all the more interest in a plant thus produced. Florists, with their propagating benches, turn out plants by hundreds and thousands. Their propagating houses are regular plant factories, in which the raw material of cuttings, is turned out as the finished product—the rooted plants. Several years ago we published a method by which the amateur could multiply his plants in all needed numbers, and with something like the certainty that attends the larger operations of the florist. The method alluded to is known as "the saucer system," and, as it will be new to a large number of our readers, we give it in brief. The out-fit needed is sharp sand—if from the sea shore, let it be thoroughly washed, to deprive it of all salt—and a saucer, soup-plate or other dish, that will hold an inch in depth of sand. Cuttings are made of the tender growth of house plants, an inch or two long, and set in the sand so closely together as to touch one another. The dish of sand containing the cuttings, should be set in a sunny window fully exposed to the light, and the sand, from the beginning must be "sopping wet," and kept in the

state of mud continuously. If the sand is allowed to get dry, most of the cuttings will be lost. Some cuttings will be rooted in a week, others in two or three weeks. As soon as roots are formed at the base, the cuttings should be potted off in rich, light soil. Shrubs that do not root readily from cuttings of the ripened stem, will often grow readily in the saucer if a tender shoot be taken.

A Stump Puller.

Mr. J. E. Croll, Buffalo, N. Y., sends us a sketch of a very simply made stump puller. He says "I have seen this wrench out some tough old fellows, and with a good team, nearly all stumps with partially decayed roots, can be cleared from a field with it. I think it is not patented."—The only expense

A SIMPLE STUMP PULLER.

is for the chain (links of one-and-a-half to two inch tough iron, or tough-tempered steel); ring (ten to twelve inches in diameter), and the hook—all of which any blacksmith can make. The form of the point of the hook is important, to get it so that it will strike in toward the heart of the stump and not tear loose on partially decayed wood. The lever may be twelve to twenty feet long, its size depending on the quality of the wood, and the man force to handle it. A lever twenty feet long on a stump two feet in diameter, would exert a force of ten tons for each one thousand pounds of direct pull by the team. While many durable, long-rooted stumps would not yield to this, the large majority of ordinary stumps, after decaying a year or two, can thus be cleared out with most of the roots. The whole cost of the pulling apparatus is small, and the operation is very simple.

Improved Barrel Coops.

Barrels, casks, or hogsheads, cut in two, are much used for coops, and are a cheap provision. But instead of the common method of sawing them square across, a diagonal cut, leaving the halves, or the lower part, if but one is made of a single cask of the form shown in the engraving, will be found a great improvement both in shedding rain and in appearance.

Now for Plenty of Lima Beans.

All would-be prosperous, forerhand farmers, will have their garden plots planned for during the winter, including an ample store of well-rotted material set aside in the barn-yards, or elsewhere, and decide the amount of and each kind of vegetable, etc., to be grown. Attention enough is not usually given to Lima beans, well called the "king of vegetables," so delicious both in succotash and when cooked by themselves, green or dry, at all seasons. Now is the time to have poles cut, sharpened and piled away, all ready. Every good sized family should have a hundred of these. Those burning wood can select and save many suitable sticks from the summer stock of fuel now in preparation. Cedar or locust poles are best; we have a lot of cedar that have been used for fifteen years, and still as good as ever. But any saplings or nearly straight limbs, two-and-a-half to four inches in diameter at the butts, and seven to nine feet long, will answer for a couple of years or more. Sharpen with a lough bevel, so that they can be

easily forced deeply into holes made with a ew-har or hard-wood stick driven in two feet or so, according to the firmness of the soil, and worked each way to enlarge the hole to suit each pole.

Lima beans can be grown successfully up to forty-two degrees north latitude, and even much further north, if planted early, and especially on southern exposures. Indeed, they are so valuable that it will pay to grow them, if on the average only every alternate crop fully matures, since the unripe ones caught by an early frost, are excellent when dried in this state and kept for cooking. Last September's early frosts killed many plots, and seed will probably be high this spring, but a quart will plant a large area. A single vine occupies six to eight feet of perpendicular space, and often yields two to three hundredfold. A warm, sandy loam, naturally or artificially drained, is desirable, as the chief growth is during hot weather; but any dry, fair soil, made light and rich with plenty of well-rotted stable manure, will answer. A great gain in time can be secured by starting the seed a few weeks in advance, and the crop will repay the trouble. Provide now a lot of boxes of any thin boards or other material, of tarred paper or pasteboard even, say six inches square, and four to five inches deep. Start four or five seeds in these well in advance, and when the soil is warm, transfer the whole, the roots undisturbed, to the hill. Sods four or five inches thick, with the surface grass removed, cut into six inch-squares, and left together, can in like manner receive and start the seed, and be removed to the hills at the proper time. It will pay to keep fifty to one hundred five or six-inch pots for this purpose, but the sods will cost nothing, and serve nearly as well. At any rate, let every farmer, up to the Canada border, if not over it, have plenty of delicious, nourishing Limas. Any surplus beans will almost always sell for \$5.00 a bushel and upward, in spring.

The Langshan Fowl.

P. H. JACOBS.

The recent introduction of this excellent breed has added much to the value of poultry, as the Langshans seem to possess a greater number of advantages for farmers than any other variety. In procuring Langshans, however, it should be remembered that the Black Cochins so much resemble them that only experts are able to distinguish them. But while very similar in plumage they are entirely unlike in characteristics. Langshans, though large in size, mature early, the pullets often beginning to lay at five to six months old, while the Cochins are slower in growth, and do not lay until from seven to ten months of age. Both breeds are black in plumage, elegant in appearance, and grand in carriage. To distinguish them, first see that the legs of the Langshans are similar to those of a turkey, with pink between the webs of the toes, and the bottoms of feet white or flesh color. The skin should be white and thin, in all respects resembling that of the turkey. Any white feathers among the black of the wings or on the body are a defect, though one or two occasionally on the feathering of the feet is not always an objection. The legs are heavily feathered; the comb single and straight, and the eyes and bill dark; the sickle feathers of the tail long and flowing. The size should be nearly that of the Brahma. The Cochin is devoid of sickle feathers, is yellow under the feet and between the toes, has yellow skin, and in shape is more compact and close than the Langshan.

The Langshans do not lay very large eggs, nor sit before laying a fair number, but when they begin incubation are faithful and reliable. The chicks grow faster than those of any other breed, and are generally well feathered in a short time, and so do not have that lank, naked shape so peculiar to the Asiatics when young. If fed liberally the chicks average two pounds at ten weeks old, but in ordinary broods, fed moderately without deprivation, it is best to allow three months for attaining this average weight. Yet as with all other breeds, there are a few objections to the Lang-

shans. The dark plumage and legs are a disadvantage in a market fowl, though the flesh dresses exactly like that of a turkey, being white and quite attractive. Unlike the clumsy Black Cochin, the Langshan can fly over a six-foot fence, which, though not a desirable quality in a fowl, is an indication of activity and disposition to forage. —Crossed on common fowls the Langshan makes quite an improvement, for the size is thus increased without impairing early maturity of the pullets, which is the strongest point in their favor, for they begin to lay nearly as soon as the Leghorns, are larger, and less hard to confine. Crossed with White Leghorns the result is a white fowl with a few black spots, but an excellent layer. The leg feathering, while not necessarily objectionable, is not desirable in wet seasons, but coming from the North of China, the Langshan is hardy, and endures all the temperatures natural to other fowls. They are fine in bone, fine-grained in flesh, and nearly equal to the Games for the table. They are far superior to the Cochins in many respects, but having been crossed with them to a certain extent many yards of Langshans are not strictly pure and free from contamination with blood of other breeds.

Adjustable Portable Scaffolding.

Mr. F. S. Fulmer, Gibbon, Neb., writes us: "I have had a good many helps in my life, and in return I send you a rough sketch of a very useful

Fig. 1.—A SCAFFOLD BRACKET.

thing I find in common use here, hoping it may be valuable to others. It is for erecting scaffolding in building, or other similar purposes, and is just the thing, easily set in place, with no nailing to the

Fig. 2.—THE SCAFFOLDING IN POSITION.

building or marring in any way. It is used in weather-boarding, painting, shingling, etc. A scaffold can be erected or taken down in a very few minutes. In figure 1 is seen a "bracket," and figure 2 shows the scaffolding in its position.

British Shorthorns.

"Lady Pamela," the grand heifer whose portrait we give herewith, is one of a family which has been winning for Mr. T. H. Hutchinson a number of the most coveted prizes. She is roan and white, by the Booth bull, British Knight (33,220,) from Lady Pateley, a cow tracing to the same stock from which others of Mr. Hutchinson's prize winners have sprung. This, it seems, is the "common" unrecorded stock of the country, no doubt admirably selected and really well-bred Shorthorns, though until recently without pedigrees which could be recorded in the Herd-book. Booth bulls have been used to bring up this "Hutchinson family" to its present high standard of excellence, and though their pedigrees are very short they are exceedingly choice. This heifer won first as a yearling at the "Royal" show at Reading in 1881, and last year was awarded the proud distinction of "champion" of all Shorthorn females.

We are fond of long pedigrees in this country, and if the breeding has been long continued in America, we are critical even to over niceness, and much of the talk about "seventeens" and "American Woods" condemns some stock which is probably just as good and much better bred than that from which these now famous "Hutchinsons" sprung. The use we have for Shorthorns in this country is primarily, as beef producers. While their milking qualities are of small account compared with other breeds, these may be cultivated, hence we often find some very respectable milkers among Shorthorns. So it would seem to be the policy of American breeders to select their crosses, as Mr. Hutchinson has done so successfully, from the highest type of beef families—like the Booths. We have some grand representatives of this blood in this country, and they are making their mark in a very favorable way among a number of prominent Western Shorthorn herds.

Lady Pamela is described as without any air of high breeding or special beauty, but as possessed of extraordinary good beef points, grand constitution and great depth of flesh. This is exactly what we want. It is what Shorthorns are bred for, and is really the chief use the country has for them. This loads our railway trains and freight steamers with first-class bullocks; it gives us our finest market beef; it makes reputation abroad for our "prime family mess," and enables us to ship buttocks or "beef hams" going only three or four instead of six or seven pieces to the tierce.

Try the Savoy Cabbage.

The cauliflower, the most delicious of all varieties of the cabbage, is of too much uncertainty to be recommended for the farm garden. The Savoy cabbages are almost as tender as the cauliflower, have a distinct flavor, and a marrowy consistence of their own, which some prefer to cauliflower. These being as easily raised as the common cabbage, are within the reach of all. Those who have cultivated Savoy cabbages need no advice; to those who have not, we say, by all means try the Savoy. The English authors of works on gardening regard them as so different that they class them by themselves, under Savoy, and not among the cab-

bages. When we first knew them there was but one kind, "the Savoy," now there are a dozen or more Savoy, including early and late kinds. Perhaps the "Improved American Savoy" will be best for those who try Savoy for the first time. Afterwards they will be glad to test the early and late kinds. The seeds are to be sown and the plants treated exactly as those of the ordinary cabbages.

Planting Out Cuttings.

Those who already have grape vines, currant and gooseberry bushes, or quince trees, may readily increase them from cuttings, and the same may be done with many ornamental shrubs. If the grape vines, currants, etc., were not pruned last fall and cuttings saved, do it at once, before growth starts. These prunings, removed for the good of the plant, and its future fruitfulness, afford the means of greatly increasing the stock. The cuttings of some grapes, like the Delaware, and other hard-wooded varieties, do not readily

THE PRIZE SHORTHORN COW "LADY PAMELA."—Engraved after the *Agricultural Gazette*, London.

form roots and grow in the open ground, but the Concord and many others take root very readily. Make cuttings of the grape wood two or three buds in length, cutting just below the lower bud, and half an inch or so above the upper bud. Cuttings of currant and gooseberry may be about six inches long, of the growth of the previous year. Quince cuttings may be made of last year's growth, or of older wood, a foot long. If the pruning has been delayed until this spring it should be done as soon as possible after severe weather is over, and the cuttings made from the prunings. As the soil will not be ready for setting them out for some weeks, they should be kept in a cool place and prevented from drying by covering them with earth, sand, sawdust or moss. When the soil is dry and in working condition, the cuttings may be set out. Stretch a line, and with the spade form a trench with one slightly sloping but nearly perpendicular, and of a depth proportioned to the length of the cuttings. These should have the upper bud just at the surface of the soil. Having prepared the trench, lay the cuttings against the straight side of it, three or four inches apart, using a little earth, if need be, to hold them in place, and taking care to have the upper bud just above the surface. Then draw in more soil, to well cover the ends of the cuttings, and, using the end of a piece of board, press or pound the soil firmly against the base of the cuttings; finally fill the trench with soil and press it down firmly with the foot. Recollect that success in growing these plants from cuttings largely depends upon having the soil in close contact with the lower end of the cuttings. Mulebing the surface of the cutting bed with leaves, straw, or marsh hay, will be useful in dry weather.

Buy a Grape Vine.

If there is one thing that we have these many years endeavored to secure, it is that the family of every farmer shall have an abundance of fruit. Not fruit now and then, as a luxury, but fruit as a matter of course. Enough for old and young, as much as the children wish at each of the three meals, and a plenty between meals, with some to give to the less provident neighbors. There is nothing in this endeavor that may not be accomplished if we can have the help of those most interested, the farmers themselves. The land can be spared—indeed, it can be devoted to no better use: the labor, after the first planting, can be easily done by the boys, and the girls also may well take a share of it; it only remains to make a beginning. There are few prosperous farmers who can not afford to send an order to a nursery for plants to start an ample fruit garden at once, but we are well aware that few will do so, as they have had little or no experience in fruit culture and are not convinced of its utility or the ease with which results may be secured. Those who hesitate to make a considerable outlay, should begin in a small way. It is very easy to have an abundance of grapes, and they could be had by bushels in three years if a hundred vines were planted this spring. As few have sufficient faith to start with a hundred vines, we say "buy a single grape vine." This will be a beginning, and in time will grow into many vines. We are sure that seeing the success with this one, the fruit that just one vine will produce, its owner will not wait until he can make many vines

from this one, but will need no persuasion to procure more vines and of different kinds. If a grape vine is once planted we are sure that it will prove an entering wedge, and open the way to many vines.

To begin with, send to a nursery for a Concord vine. Twenty-five cents should insure a good vine, well packed and post-paid by mail. Our plan does not preclude more than one, but we wish to make sure of one. Of course many grape fanciers will ridicule our choice of the Concord. We want grapes, and plenty of them, and whoever has a Concord vine will be quite sure of these. Concord grapes are vastly better than no grapes. While we cultivate fifty or more better kinds we still believe that the Concord is the best grape for the beginner. When the vine comes to hand it is to be planted. It is well to have it near the house, and if there is a suitable place for it by the veranda or "stoop," set it there. Good, fair, garden soil will answer, and no manure is to be used in planting. The vine will, of course, have a stem and roots. If the stem has more than three buds cut it away at about an inch from the third bud, counting from the lower one. If the roots are over two feet long, cut them back to that length; if less than two feet, cut off two or three inches of the end, at any rate. To plant the vine make a circular hole, of sufficient diameter to contain the roots when extended with the vine in the center. The bottom of the hole should be convex, or rounding, say five or six inches below the surface at the center, and eight or ten at the edges. Set a stake in the center of the hole, place the stem of the vine against it, and spread out the roots in all directions towards the outer edge. If the roots are matted and tangled, carefully separate them; when the roots are prop-

erly spread, throwing a little soil on them; if needed, to hold them in place, cover the roots with the best of the soil, taking care to have it well filled in, leaving no empty spaces among the roots. When the hole is nearly full, press down the soil firmly with the foot; do not tramp or stamp it, but press it squarely. There will be nothing more to do to the vine until growth begins. When the three buds left upon the stem begin to start, rub off all but one, leaving the lowest one, if that is as strong as the others, and if other shoots start during the season remove them. The shoot from the vine is very tender at first, and care must be taken that it is not broken; when it is a foot or so long it may be tied to the stake, using a strip of cloth, or bass matting, and it should be kept tied up as it grows. Try one vine, plant it properly, and watch its entire growth; it will teach how to grow many vines.

Timothy, Herd's Grass.—Confusion of Names.

Names, especially with farm plants, should be definite, and designate certain things. If a plant is called by one name in a certain State and by an-

TIMOTHY GRASS (*Phleum pratense*).

other name in a not very distant State, and this second name is also in use for a very different plant, confusion is sure to follow. This is the case with the grass widely known as Timothy. When the writer was a boy, the grass was generally known in New England as Herd's Grass. Though Timothy has since come into use in those States, yet there are localities where the name Herd's grass is still retained. To add to the confusion, the grass called Red-top in New England is known as Herd's grass in Pennsylvania. While Timothy is given to but one grass, when our correspondents ask us about Herd's grass we are in doubt which of two very unlike grasses is intended. The grass did not receive the name Herd's grass, as many suppose, because herds of cattle are fond of, and thrive upon it, but because a man named Herd, discovering it growing wild in New Hampshire, brought it into cultivation and notice over a cen-

tury and a half ago. It is not unlikely that this name, Herd's grass, has the priority over Timothy; but the dates are not given very definitely. The name Timothy comes from one Timothy Hanson, who cultivated the grass in New York State, and carried it to one of the Carolinas. It made its way northward to Virginia, being often called "Hanson's grass" and "Timothy Hanson's grass," until the Hanson was finally dropped, and it became Timothy. In 1760 or 1761 one Peter Wynch took the seeds of this grass from Virginia to England, where, although a native of that country, it for the first time came into cultivation there, and is now regarded as one of the important grasses. This grass has a truly singular history. Not known as indigenous to this country, it must have been introduced from England or some other part of Europe very soon after the English colonists came here. Its good qualities as an agricultural grass were first discovered far from its home, and finally, by way of the Carolinas and Virginia it went back to Europe with its character established and took its place among the valuable farm grasses. To add to the confusion of names, the grass, in England, is called "Cat's-tail" and "Meadow Cat's-tail grass." The confusion often attending the common names for plants, might be avoided by using the botanical names, which are vastly more definite. *Phleum pratense* always stands for one and the same plant, whether it is known as Timothy, Herd's grass, or Meadow Cat's-tail. As to the plants themselves, they are abundantly unlike. Timothy (*Phleum pratense*), has its flowers in a long narrow spike of the same diameter throughout, like that in the engraving. Red-top, often called "Herd's grass" in Pennsylvania and southward, has its flowers in an open panicle, much like the panicle of an oat, only the flowers are much smaller. The botanical name of this is, *Agrostis vulgaris*.

Producing New Varieties of Potatoes.

The tubers will sometimes, though rarely, "sport," and produce a different variety from the one planted, giving the impression that they will "mix in the hill." The only way to be certain of producing new varieties, is to plant the real seeds, those found in the fruit or "ball," that succeeds the flowers at the top of the vine. Each seed in a ball may produce a distinct variety. That wonderful seed ball which contained the seed from which came the Early Rose, also produced several other varieties, some of which were good enough to be propagated. People have been deterred from trying to raise potatoes from the seed by the statement in the books, copied from English writers, that the tubers first obtained were very small, and required several years of cultivation before their quality could be ascertained. Mr. Breese, who was the fortunate originator of the Early Rose, and has had much experience in raising seedlings, informed us that he treated the potato seeds just as he did those of the tomato, sowing the seeds in the same manner, and setting out the plants at the same time. If a seedling did not at the end of the first season show some tubers of an eatable size, he did not bother with it any farther. Some seedsmen offer potato seeds, but unless it is known what variety produced them, we should prefer to wait and secure seed next fall from known varieties, and thus be sure of the pedigree of the seedlings.

The Sunflower as an Oil Plant.

Inquiries have recently been made of us concerning the cultivation of the Sunflower on a large scale for the sake of the oil contained in its seeds. The sunflower as an oil plant is sparingly cultivated in France, and to a greater extent in Southern Russia. In this country, aside from Castor Oil and Linseed very little has been done in cultivating oil-bearing plants. We have now less need of cultivating them than formerly, as the products of petroleum afford a wonderfully cheap illuminating oil, while oil for other uses is obtained cheaply from cotton seeds, formerly a waste product.

Abroad the sunflower is not regarded with much favor as an oil-bearing plant, as the yield is only about fifteen per cent. of the weight of the seeds, while cotton seed (hulled) yields fifty per cent. The ashes of the sunflower stem contain a very large amount of potash, showing that the crop draws very heavily upon the soil for one of its most valuable plant constituents and would soon impoverish it.

Forming a Tree Top.

W. D. BOYNTON.

It is of the utmost importance that young trees start out with a well-formed top. They are to stand as monuments of the cultivator's work, perhaps for centuries after his hands have ceased to toil.

Fig. 1.

They may be living green memorials of work well done, or unsightly objects of man's neglect and abuse. Their usefulness depends altogether upon this early training. Low, broad tops for fruit trees are especially desirable, and they very seldom attain them, unless trained with this object in view. Until young trees are finally placed in the orchard, the treatment and way of handling tends to draw the limbs up near the trunk, and unless this is counteracted, they assume an almost vertical growth, giving the tree a narrow and contracted appearance. Such trees are usually unfruitful, and not at all convenient for gathering the fruit. Close contact and rapid growth in the nursery causes the limbs to grow up, and when removed they are tied in the smallest possible bundles, and drawn together in a little knot at the top. Perhaps after remaining there for a week or two, they are untied and buried for the winter, the tops being pressed together unnaturally five for or six months. After all this perversion some even claim that any after-training is unnecessary and injurious, as they will naturally take that form best adapted to their location and its conditions. If the form had not been artificially molded, we could more read-

Fig. 2.—TREE IN TRAINING.

ily allow nature to execute her own designs; but when nature's functions are usurped, we must carry on the work to completion; the contracted top must be brought back into a natural shape, if we would have a thoroughly fruitful tree.

Figure 1 represents a tree as it usually comes from the nursery. The trunk is not at all protected by the narrow top, but is left exposed to wind and sun, which work such havoc in the alternating weather of our Northern winters. Figure 2 shows an arrangement for bringing the limbs into proper position. The frame is made by driving four posts three feet apart at the ground, and five feet at the top, their height corresponding to that of the tree. The cross strips can be cut from batten stuff or any odd pieces on hand. One strip around will do, but two or more increase the solidity and durability, and better protect trees from large animals. Tarred rope or cord is best for tying the limbs

down, attaching them with broad strips of cloth to avoid injuring the bark or contracting the growth. Let the limbs be drawn down gradually, a little at a time, through the growing season.

An Insect Enemy of Fruit Trees.

Next to the quince borer we have found the caterpillar of the Handmaid Moth (*Datana ministra*)

Fig. 1.—EGGS OF MOTH.

the most destructive. It is often found on apple and cherry trees, as well as on the quince. Entire branches of large trees, and even whole trees, if small, are rapidly stripped of all their leaves. The moth fastens its eggs on the under side of the leaf in rows (fig. 1), selecting leaves near the ends of the

Fig. 2.—BEFORE THE FIRST MOULT.

Fig. 3.—BEFORE THE SECOND MOULT.

twigs where the foliage is tender. Each group of eggs contains about a hundred. They hatch from the latter part of July until late in August, varying somewhat with the seasons. When young they eat only the pulp, dissecting it very carefully from the veins. In a few days they are able to eat the whole leaf; and when nearly grown they sweep everything before them. They feed gregariously, side by side in solid phalanx along the twigs and branches, resting between meals in the same order. In repose each holds its head and tail up in the air, or recurved over the body. When touched or otherwise disturbed they throw their heads spitefully from side to side, at the same time jerking their tails and bending their bodies until their extremities nearly meet. Their bodies are sparsely covered with long and soft whitish or light gray hairs.

Up to the first moult they are brown, striped with white, growing darker with age, and are marked more distinctly at each successive moulting, until at last they are distinctly striped with bright yellow and black (fig. 6). The head is proportionally large and black. The body is cylindrical, with a spot on the top of the first ring. A black stripe runs along the back, and three black stripes alternate with four yellow ones on each side. The whole length is one and three-fourths to two and a quarter inches. The legs are a dull orange-yellow, three pairs under the rings next to the head, then

Fig. 4.—BEFORE THE THIRD MOULT.

stinging the full-grown caterpillar. The illustrations will aid in recognizing the caterpillars in all the stages of their life history and so help to more effectually destroy them. Figures 2, 3 and 4, show the caterpillar before the first, second and third moults, respectively, figures 5 and 6 before and after the fourth moult, when ready to change.

Fig. 5.—BEFORE THE FOURTH MOULT.

two rings without legs; next four pairs under as many rings; and then two rings for the tail without legs.

When young they often drop from the leaves, if

Fig. 6.—AFTER THE FOURTH MOULT.

disturbed, and hang suspended by a fine silken thread. In about five weeks they mature; and, when ready for their transformation, the whole brood leave the tree in a single night, burrow three

or four inches in the earth, draw in at the ends and enlarge in the middle until in a single day they cast off their skins and become chrysalids (fig. 7) without making cocoons. They remain in this state until the latter part of the next July, when they come out as perfect moths. The moth measures from one and three-quarters to two and a half inches. In some points the sexes differ. In the male, the antennae have two rows of fringe beneath, with very short hairs nearly to the tips. In the female, the antennae are bare. She is larger than the male. Their color is a light brown. The head, and a large square spot on the thorax, are dark chestnut brown.

Fig. 7.—CHRYSLIS.

The hairs on this spot can be raised up so as to form a kind of crest. The fore wings are slightly notched on their hinder margin, with four dark transverse lines in the males, and often five in the females, with one or two dark brown spots near the middle; and a short, oblique, dark line near the tips. One, and sometimes both, dark spots are wanting on the forewings of the males. In repose, the forelegs are always stretched out before the body. It is very important to destroy these moths before they lay their eggs on the leaves; and if the broods are hatched and commence eating the leaves, no pains should be spared in destroying them as soon as possible. We have once seen a pair of flies a little larger than the common house-fly (fig. 8), busy

Fig. 8.—PARASITIC FLY.

that come with each spring, we give a few points that should be observed in successful lawn making.

THE GROUND.—The lawn is to be permanent, and as several crops of grass are to be taken each year, the most important part of lawn-making, is the preparation of the soil. A small lawn should be perfectly level, but if it is several acres in extent, a gently undulating surface is desirable. Drainage being secured, the soil should be prepared as thoroughly as if for a garden. This means deep working, fine tilth, and as much well decomposed manure as can be spared. After thorough harrowings, the surface is to be finished with rakes, to remove all the stones that these will take off. If there is no use for the stones dig holes, and bury them in the soil of the lawn.

TURFING THE LAWN.—If good sods, from a well cropped pasture, a common, or the road-side are to be had, it is better to turf a small grass-plot than to sow seeds. Sodds are to be cut a foot wide, using a board as guide, and a spade ground sharp to cut with. The sods may be made into rolls as large as can be handled, and laid down very rapidly. Before laying the sods the surface should be made firm by rolling, or by beating it with a pounder made of a piece of plank. In laying the turf, bring the edges in close contact, fill up the vacancies with bits of the sods, and if the edges do not fit closely, fill all openings with fine soil. After it is laid, beat the sod down firmly with the pounder, or back of the spade. If the weather is dry, give a copious watering every few days until rain falls.

GRASS SEED—WHAT KINDS?—Many years ago we paid a high price for "French Lawn Mixture," which claimed to be the mixture used in the lawns

THE JERSEY RED OR DUROC PIG.—(See page 110.)

about Paris. This was such an utter failure, that we have not tried any so-called "lawn-grass" since. What is known as the "Central Park Mixture," is recommended by good authorities, but we have not tried it, being content with one kind of grass, with a little White Clover, say a quart of white clover seed to the bushel of grass seed. For light soils, Red-top—especially the variety called Rhode Island Bent, with the clover, makes an excellent turf. For strong soils, especially those in a lime-stone locality, June-grass, or as it is more generally called, Kentucky Blue-grass, is best. This with the White Clover, will make a perfect lawn. Several of the grasses so desirable in the lawns in England, perish under our hot suns.

The Lawn, and How to Make It.

It makes no difference how much may be expended upon trees and shrubs to ornament the ground—by which we mean a large pleasure ground, or a small front yard—if these are not set off by a fine turf, the effect will be lost. In all improvement, whether of a village front yard, or a home park, the groundwork should be grass. It has been well said, that the lawn is, outside, what a carpet is within the house, the setting which improves all the rest. The lawn is not merely a small meadow near the house, to be mown for hay. It is a piece of grass given up to ornamentation solely, and should be made and maintained with no other object in view. To answer the numerous inquiries

How MUCH SEED?—SOWING.—Grass-seed varies so much in quality, that it is not surprising that different authors recommend from two to eight bushels of seed to the acre. Two or three bushels are enough if the seed is good, and the larger amount is hardly sufficient if the seed is largely chaff. Blue-grass seed is often excellent, and again so poor, that it is difficult to find a good seed among the chaff. The price is variable.

Farm Fencing.

Fences are a necessity, and nothing detracts more from the looks of a farm than a poor fence, especially a neglected zigzag or "snake" one, with its corners a mass of weeds or litter. In many of these there is abundant material to make a good straight fence. A good deal of the work can be done in winter or early spring days, and on rainy ones. Figure 1 shows a portable "Fence Jack," very useful on wet land where posts beave, around stacks, and for general fencing. It can be made of pieces of rails or poles, or any lasting timber; the pieces are from five to six feet long. A short foot piece is first shaped, and then fastened on with five or six inch nails as required by the size of the pieces. The mode of laying in

Figs. 1.—FENCE JACK AND ITS USE.

the running rails or poles, is shown in figure 1. The feet of the jack rests on the soil, but sink into it a little, giving firmness. I have this in practical use, and find it very serviceable.

Figure 2 is a fence made of either sawed stuff, or of rails or poles, having their ends flattened and bored. An iron rod or piece of gas-pipe, anywhere from half an inch to an inch in diameter, is run through the holes, and down through a base block into the ground as far as necessary. A round stick of tough durable wood, an inch or more in diameter, will answer. The size of this rod and its strength will depend upon the amount of zigzag that is given to the lengths. If the corners are one foot on each side of a central line, the fence firmly held together by the rods, will in effect stand on a two feet wide base. Less than this would per-

Fig. 2.—FENCE FASTENED BY RODS.

haps sometimes answer, and there are no sharp corners, or deep recesses for rubbish.

Figure 3 is a fence in which round poles or small rails are combined with barbed wire, the former used both for part of the fence, and to be seen by animals that would otherwise run against the

Fig. 3.—FENCE OF SLATS AND WIRE.

wires. The ends of the rails are rounded to fit into two to three inch auger holes, bored either through the posts, or two to three inches deep on each side.

Rails or poles too small for other purposes, may be used for such a fence.

Figure 4 is designed for a wind-break fence. For the temporary fence, two or more wires plain or barbed are used, and along these, a foot apart or so, willow cuttings sharpened, are set in line, and cut off to uniform height. The larger these are the better, even to two or three inches diameter. This form is more especially for wet soils, where any willows flourish well. They will soon sprout, fill the space, and form a live fence. I have seen white willow growing well on dry soil. J. BARTLETT.

A Crop of Early Potatoes.

Of course, to have a crop of early potatoes we must have an early kind. There are now so many varieties, each claimed to be a day or two earlier than any other, that we do not venture to say which is the very earliest. Our own planting will be, as it has been for several years past, of the Beauty of Hebron and the Early Rose for the main reliance. We usually try, in comparison with these several new varieties for which claims are made. We have no doubt that there are kinds some days earlier, but the Beauty of Hebron is as good as a potato can be, is productive and of even size. The Early Rose has been surpassed in earliness, but we doubt if in the general combination of good qualities. It is an excellent standard with which to compare new-comers. We plant it in part in acknowledgment of the great good it has done. Those who can recollect the gloom which

Fig. 4.—WIND-BREAK FENCE.

hung over the potato prospects about twenty years ago, and the change came with the advent of the Early Rose, will understand this feeling. Potato culture took a sharp turn for the better, and the Early Rose was the leader in a long procession of new and excellent varieties. Whatever early potatoes we may plant, we may make them earlier by proper treatment of the seed. A potato is only an underground stem, and when we cut it into sets, we only make what corresponds to cuttings of ordinary above-ground stems. It is found if the tuber, the potato, be brought into the condition of an ordinary stem its buds, the eyes, push sooner and are more vigorous. On the island of Jersey early potatoes for the London market are an important crop. The preparation of the seed for the next year is commenced as soon as the crop is dug. Shallow boxes are provided, two feet long by one foot wide, with sides two inches high. At each end is a frame work made of two corner posts seven inches high with a cross strip at the top. These end frames allow the boxes to be stacked upon one another and leave plenty of room for air and light. The potatoes for seed are set close together in these boxes, "seed end" up, and left out of doors in any convenient place with full exposure to the light. After a while the potatoes become thoroughly green, and a few short, thick sprouts are formed. When the weather becomes cool the boxes are taken in and stored where they will not be frozen. At planting time these potatoes are set upright in the furrow; being well provided with sprouts that have only to continue their growth, much time is gained. It is worth while to try the experiment, even as late as this, and expose the seed potatoes to light and heat. In the Island of Jersey whole potatoes are planted, but it would be well to try cutting the seed, leaving one or two sprouts to each piece, taking care not to break them.

A Questionable Blessing.

Rev. J. G. Wood, the Naturalist, in a late number of "Longman's Magazine," makes a plea for the mole. He cites evidence to show that this commonly considered pest is in reality a blessing to farmer and gardener, in destroying worms, larvæ, pupæ, and ground insects; in aerating and draining the soil with his burrow; in lifting the under-soil to top-dress the surface-soil, etc., etc. By the same reasoning, as every creature has its uses, not one should be destroyed; and the pious Brahmin who never kills beast, bird, or insect, is sensible and humane. But this parity of reasoning is a poor consolation to a man stung by a wasp, bitten by a snake, or devoured by a tiger; and the humanities are quite wasted where they are in direct antagonism to man's economies, comforts, and necessities. The question is one of compensation, certainly, so far as the mole is concerned. If, like the crow, he only did a very little harm to a great deal of good, no farmer or gardener would anathematize him; but, to see all my lawns and terraces so completely burrowed and aerated as to be seamed with lines of dead grass; to have my rose-borders honey combed with tunnels that kill the growth of the now vigorous plants; to have my garden so ridged as to destroy the peas, beans, and beets, as effectively as if a fire had passed under the rows; to have rod upon rod of the choicest strawberries lifted from the ground—all this makes me think the benefactions of the mole are of the *non sequitur* order. The richer the land, the more worms; so the penalty we pay for free manuring is—moles. Once in the soil, by natural selection and survival of the toughest, he stays, and woe to the succulent and savory products of that field or garden where the mole has his habitat. And, as the increase of this benefactor is in proportion to his undisturbed occupancy, the alternative soon is—root out the benefactor, or abandon the soil. Mr. Wood would have the mole remain to root out the grubs, but I much prefer the grubs to the moles; so the order on my place is to "turn the rascals out," to kill and destroy by every means possible.

And here let me add—what a delusion and a snare are the patent mole-traps now on the market. With me not one is effective. If one does occasionally pin a mole in its run, it is, as a rule, provokingly inefficient. My remedy is—poison. I taint a bit of raw beef with Fowler's solution of arsenic, carefully uncover the run, drop in the beef, re-cover the opening with a board, and the work is done.

O. G. V.

Spring Work Around the House.

The first work will be to repair the damage of winter. If storms or accumulations of snow have broken the branches of any trees, the broken limb should be cut back to the trunk, and the wound covered with paint or grafting-wax. Improvements and alterations should have been well considered during the leisure of winter, and be ready to be executed as soon as the ground is open. New roads and paths should only be made where they are needed. It is a mistake to cut up the ground with useless paths; they look very pretty "serpentine" on a plan, but cost a deal of work to keep in order. Thorough work is required on all lawns and drives. Neither can be made permanent without a good foundation. Where stones are at hand, excavate the bed and throw in the largest stones first, adding the smaller ones above, and finish with gravel. In localities where there are neither stones nor gravel, coal ashes is the best material; spread the ashes upon the surface, adding a little soil to make it bind, and form a compact, hard surface. While flower beds are greatly improved by being framed in the green of the lawn, the lawn is by no means improved by being cut up too much by flower-beds. If one or the other is to be in excess, let it be the turf. Plant ornamental trees and shrubs early, and cut back the top in proportion to the loss of roots. Maple, elm, and other trees from the woods, lose their fibrous roots to such an

extent, that they are quite sure to die if planted with their entire heads. If these trees are made into bare poles, cutting off every branch, they will be quite sure to live, and will form a new head in a very few years. Laurel or Kalmia, one of our most beautiful broad-leaved evergreens, is regarded as very difficult to transplant. If every branch is removed at the time of transplanting, so that not a leafy twig remains, it is quite sure to succeed.

Let Us Have More Stocks.

By "stocks," we do not refer to those of Wall street, but to those charming flowers which were among the chief ornaments of the flower garden a few generations ago. The more recent Verbenas, Petunias, and other more showy introductions, have crowded aside the Stocks, the Wall-flowers, the Daffy-down-dillies, and other old-fashioned fragrant flowers. We wish that our horticultural societies would offer premiums for Stocks. They offer prizes for Orchids, which can only be grown by the wealthy, and offer no prizes for Stocks and other flowers which every one can grow—those dear old favorites, which bring to us the odors that delighted the garden-lovers of former generations. The "Stocks," as they are now called, were the "Stock gilliflowers," or "gillies," of the older gardens. They were favorite flowers with that eccentric statesman, William Cobbett, who, during his sojourn on Long Island, took much pleasure in cultivating them. He writes: "If I were to choose amongst all the biennials and annuals, I should certainly choose the Stock. Elegant leaf, elegant plant, beautiful, showy and most fragrant flower." The Stock has not changed since Cobbett thus praised it, and we know of no flower more worthy of attention. There are several kinds of stocks, but the so-called "Ten Weeks Stock," is the kind we have in mind. A packet of mixed seed will make a great variety, but those who are willing to pay for them can get separate colors. The flowers may be had much earlier by sowing the seeds in a window box, and when an inch or so high, transplanting them to another box. When the weather becomes settled, plant them out in the garden, setting a foot apart each way. To get a fair share of double flowers, make the ground very rich. But let us by all means have more Stocks.

Root-Grafting of Shrubs.

Sometimes a shrub is found to be difficult to propagate by cuttings of either the old wood or of unripe shoots. When other means fail, root-grafting will usually succeed. A fragment of root is taken as a stock, and the cutting is inserted as shown in the engraving. If the root is large enough, cleft-grafting may be practised, or if the stock is too small for that, the cion may be attached by whip-grafting. Root-grafting is very useful with those varieties of the grape which refuse to grow from cuttings, such as Norton's Virginia, and related kinds.

GRAFTING ON ROOT.

THE TIME FOR GRAFTING.—Those grafters who go about the country grafting old orchards desire to make their season as long as possible, and they extend it at both ends. In February they claim, "the earlier the better," and in May find good reasons for preferring to set grafts as late as possible. We would answer several inquirers by saying that we have always had the best success with grafts set just as the buds on the stock were swelling. A cion inserted in February is exposed to the drying winds of early spring. Until vegetation commences in the stock this loss of moisture by the cion cannot be made up. A great many grafts are

lost in this manner, they actually perish in the cold dry winds. If obliged to choose between grafting in the end of winter and when the trees were in full bloom, we should prefer the latter time for the operation for all fruit trees save cherries and plums.

Spring and Summer Chicken Coops.

Mr. J. D. Woodhull, Barnesville, Ga., sends us a sketch of his chicken coop (fig. 1) for chickens in spring. A frame is made of two by four-inch light stuff for rafters, spreading two and a half feet at the bottom. The ends and rear are boarded, and the front has a foot-wide board at the top, with slats two and a half feet long covering the lower one and a half foot. The slatted side is turned toward the sun, but from it in very warm or hot weather. We add sketches made from a variety of other forms which we have seen at various times in different places. Figure 2 consists of boards two feet wide running a little over two similar

Fig. 1.

Fig. 2.

Fig. 3.

boards on the other side to shed rain. The rear is boarded, and the front also about one-third the way down; the rest has lath nailed across at proper distances. A narrow cleat across the bottom and top holds each pair of side boards together. They should fit closely, or be tongued and grooved or battened to shed water. This is preferable to fig. 1, as rains will drive in less. It is

Fig. 4.

Fig. 5.

Fig. 6.

quickly cut and nailed together without any frame. The engravings show different methods of closing and slatting the fronts. Fig. 6 is similar to fig. 2, but is boarded at the lower front corners, and a hinged cover, shown turned up, is let down during very cold nights, and in storms. The hinges may be bits of leather. The size in all these forms will depend upon the breed, or size of the hen, and room required. When skunks are troublesome, a bottom board will be needed, and strong slats. For ordinary use common lath will answer. An hour's work will make almost any of these forms.

The Back-Yard.

It has been said by some one that the back-yard is the true criterion of the refinement of the house-dwellers. So many things drift around to the back-yard, and in such a free and easy way find a lodging there that it requires a sharp eye and skillful hand to keep this place in trim. Not only must all useless and uncomely rubbish be carefully kept down for appearance sake, but the sanitary state of the back-yard needs careful looking after. If your home is in the country the impure water from house and kitchen, and wash tub, should never be poured on the surface of the ground near the house. This is a vexatious point, especially if one keeps a servant. The average domestic believes and stoutly maintains it by her works, that water of any description is properly disposed of when emptied on the ground, the nearer the house the better. "But in cold weather may we not?" asks my friend. Nature works while you sleep, and while the earth is frozen, and if you give her foul materials to work with her mysterious chemistry is almost sure to evolve something which in the coming bright spring days, or languid summertime may smite you, or some of your household, down to sick beds. The pails of soiled washwater and soapsuds emptied too near your dwelling week after week, may not be remembered, but in the shape of miasma, or tainted drinking water, will, like "curses have come home to roost." In my own

back-yard—out of sight of the house—we have a homely reservoir, and deodorizer in the shape of a pile of ashes.—A hollow in the middle receives all slopwater; impurities of which are absorbed by a daily covering of ashes from the house fires, and an occasional sprinkling of lime. In due time the whole pile becomes a fertilizer for the garden.

An authority in domestic matters tells us if we "take care of the back-yard, the front will take care of itself;" and the longer the writer keeps house the more ready is she to witness to the truth of the saying.

LUCY F.

Garden Trellises for Vines.

EBEN E. REXFORD, SHIOCTON, WIS.

A honeysuckle or climbing rose needs some support to display itself to the best advantage. When, as usual, they run on and through a fixed trellis, it is very difficult to take them down when cold weather comes, and I do not grow climbing roses or other large plants of like habit about verandas, but prefer such vines as the clematis or Wistaria for this, because of their more graceful habits and greater tractability. Roses and honeysuckles, and the like, are more satisfactory on the lawn, left to their natural development, having only a central support. I have a simple trellis in use which I find quite satisfactory for lawn and garden. It is made of a straight-grained pine board, slitted into thin strips as in fig. 1. These are bent curving outward to each side, and held apart by tacking one or more thin strips across. The bottom part, left unslitted, stands between two side stakes, and an iron rod passes through them and edgewise through the base of the trellis. It is kept upright by tying the bottom post, or driving one or two stakes on the side or on two sides of the bottom pieces. By unfastening this, the trellis will turn down on the rod.

Another plan is to make the bottom piece longer and run through two iron or wooden pins as in fig. 2. A simpler way still for a smaller trellis, is to leave the bottom piece longer, fig. 3; sharpen it and thrust it in the ground with no side stakes, and if desired to lower it remove the earth from one side, if it can not be drawn up without breaking the plant. We have used these of various forms and sizes, from a foot up to six feet high, and for most plants painting them dark green. They are on sale at most horticultural stores and some others, but may be easily made at home, and this can be done well the present month, to have them in readiness. The main thing is to have straight grained, strong wood, so that when sawed into thin strips they will not break on bending out to any desired curve and spread. The thickness of the strips will depend upon the height, the quality and strength of wood and the amount of vines and

Fig. 1.

Fig. 2.

Fig. 3.

foliage to be supported against strong winds. A very pleasing rustic trellis may be made from the top of a red cedar. The branches should be cut back, leaving the lowest ones eighteen inches long, the others gradually shorter. It may be used with the bark on, but will last longer if peeled and receives several coats of crude petroleum.

Editorial Notes on the Road.

Among the Western Cattle Ranches.

RODE all day westward from Chicago with Mr. —, a merchant of Boston, Mass. He had not long ago been persuaded to take "a flyer" in cattle, and his few head had now increased to thousands on the wild

lands north of Kearney, Neb. The entire herd, however, had just been sold to a joint stock company with a wide range north of Cheyenne, Wyoming Territory. The merchant was now going to spend his three weeks' summer vacation in accompanying the drive from Kearney to the new range, where the cattle were to be delivered. His young wife accompanied him, and thought she should very much enjoy the novel experience of going three hundred miles over the prairie with the drivers and herders, riding on horseback during the day and camping in a covered wagon at night. There is nothing more enjoyable and health-restoring for ministers, collegians and others seeking rest, recuperation and adventure than to join one of the summer cattle drives. They can go as herders, receiving good wages, or as guests, which they can always do by paying their pro rata of mess expenses, and supplying their share of game and trout. To-day it is antelope on the Big Horn, to-morrow magnificent trout from the Cache Le Poudre. Every spring herds of young cattle are purchased in Northern Utah and driven eastward to Wyoming Territory.

Consolidating Cattle Ranches.—As in railroads and other enterprises, centralization is now a great feature of cattle raising. The work of consolidating ranches is rapidly going forward, and whether for gain, mutual protection, or what not, many of the ranchmen appear to be quite willing to sell their rights, franchises, and cattle, to corporations, receiving their pay in company stock. A companion of the writer in whilom expeditions through Colorado and Wyoming, has sold his ranch and cattle "on the Sweetwater," to an English Company, for a hundred thousand dollars. A colossal Colorado Cattle Company is now apparently aiming to absorb the ranches and cattle lying between Denver and the Kansas border. Only last week the Company paid a quarter of a million dollars to one ranchman, sixty miles east of Denver, for his claims and cattle. Mr. Burnham, the Land Commissioner of the Union Pacific Railroad, recently told the writer that he had just received a proposition from the manager of a cattle company, to purchase the remaining unsold land of the Union Pacific Grant, for a mammoth range. According to the official report just made, the unsold lands amount to over eight millions of acres—a rather good sized ranch!

University men and under graduates still dream of this to them charmed life, which appears to possess a special fascination for educated young men. I have encountered these college graduates, now turned cattle or sheep raisers, all over the far West, from Manitoba on the north, to New Mexico on the south, and I have yet to find the first one to say that he was weary of the life, and desired to return to civilization. Whether collecting and driving two-year-olds from Minnesota, through Dakota to the Black Hills, or tending vast herds in north-western Nebraska and Wyoming, or living in their "shacks" or dug-outs along the Little Laramie, or gathering in their missing sheep after a furious snow storm

in the Kiowa Valley, or loping from pasturage to pasturage with their gentle flocks in the more sunny climes of south-western Kansas and Southern Colorado—these college graduates tell you that they are happy. And they appear to be so in their cow-boy costumes, with their simple fare, entire freedom, and handsome profits—that is, when prolonged winter snows, or waterspouts, or disease do not decimate the herds and flocks.

This centralization now so rapidly going on, must necessarily bar out these college aspirants for ranch life and adventure. As the cattle and sheep now become concentrated in the hands of professionals, they will want to conduct it on business principles, hiring at lower wages regular cow boys, and so monopolizing the land generally as to afford little show for eastern boys, who now, with a few cattle or sheep are their own masters, and come and go at will. Assuming that they could find employment in the large companies, the boys would not consent to become mere serving men, taking orders may be from rough, unlettered superintendents, and losing their entire independence. The whole charm of the life would then be gone. We may reasonably conclude, therefore, that there will soon be an end to leaving college for cattle raising on the plains.

On to the Front.—"Twas but the other day—since autumn grains were harvested—we rested an hour

as our fathers back here in the Middle States took pleasure and pride—hard work though it was—in felling the forests, working the fresh clearings and building their log cabins. Now, as then, these adventurous, restless spirits constitute a most valuable factor of Western growth and civilization. They are the advance guard, the charging column who drive off the Red Skins, overcome natural obstacles, and make ready the ground for the sturdy yeomanry who are to follow on their trail.

Where Mules are at a Premium.—The national prejudice against mules, very materially softened during war times, when they performed herculean tasks, and often brought up commissary supplies, but for which Union and Confederate would often have slept supperless after long marches, or on hard fought battlefields. They were as stubborn as the soldiers on both sides, but equally as patient and long suffering. To appreciate just how much a pack mule can do, one should see him starting out for a journey through defiles and over the mountains of Colorado. It is no exaggeration to say that two or three of them will carry sufficient goods from the plains for the owner to open a respectable sized store back in some mountain hamlet, and they present a droll sight indeed, as they start off in single file, loaded and fairly covered with hardware, tea chests, pots, kettles, hats, shoes, etc., etc. They are, so to

speak, the connecting link between civilization and frontier outposts and settlements which have no railroads or wagon routes.

No Doctors Need Apply.—We are told that hitherto doctors have not prevailed in Serbia, but that wise women, called Babas, claiming to have an intuitive knowledge of healing herbs, etc., have acted as physicians. When a patient is suffering, for example, from congestion of the lungs, these female physicians administer three apples grown on the same bough. If this does not effect a cure, then the sufferer lies on his stomach, while the women sprinkle salt over him, and utter cabalistic words. This mode of treatment is not more amusing than many resorted to among some remote superstitious neighborhoods in the timber regions of the far West, to which doctors have not penetrated. For instance, in one timber clearing, where we spent several weeks, the accepted cure for scrofula was this: Cut a lock of hair from as near the top of the sufferer's head as possible. Go into the dense forest, bore a hole with an auger into the heart of a large

healthy elm tree, fully ten years old. Having deposited this lock of hair at the extreme end of the hole thus made, insert a plug of wood, and when the bark of the tree has grown over the plug, the disease will leave the sufferer! This was generally believed in the settlement to be an efficacious cure for scrofula. But barring superstitions of this character among back wood's settlers and frontiersmen, many of them possess a remarkable knowledge of the healing virtues of roots, herbs, plants and flowers, a knowledge rendered necessary owing to the distance and difficulty of procuring medical attendance. The Indian herb doctor commands as much respect and observance in some tribes as the chief himself.

Romance and Reality.—Mr. Iliff, the great cattle king of Colorado, died during one of the writer's visits to his section of country. His name, his wonderful success, and his thousands of cattle were the daily topic of conversation and envy of every ranchman. Death came suddenly upon Mr. Iliff in the midst of his success. His widow, who but a few years ago ran a sewing machine for a living back in the States, was left one of the richest of women. Now comes word that Rev. Dr. Warren, whose ministry in Brooklyn, and elsewhere East, endeared him to a large circle of friends, has, as Bishop Warren, aged sixty, won and wedded widow Iliff in Colorado. The Bishop's many friends may well congratulate him on his good fortune. D. W. J.

at the prairie home of an old *American Agriculturist* subscriber in Western Minnesota, Lyon County, near Marshall. His large farm looked prosperous, and to all appearances Mr. D— had located for life to grow up and grow old with this new country. Now comes a letter announcing that he is again on the move. En route, he sends the address of the new home to which he is journeying with family and flocks, and if we wish to shoot prairie chickens over his splendid dogs another autumn, we must come on to far away Washington Territory. I am not surprised, for he evidently belongs to the class of sturdy pioneers who always want to push on to the front. Of them it is figuratively told beyond the Missouri that they become restless if a neighbor moves in within five miles of them. It is getting too crowded! They must have more room and so press on to prairies new! While, of course, this is exaggerated, there is a large class of pioneers who always want to be in the advance, and so it is that you find the front is settled with people from those States nearest to the front. Those who went from Ohio to Illinois, and then to Iowa when Iowa was new, are now pulling up and going to Dakota. Then when Dakota and Nebraska and Kansas are old, well-settled States, these same restless spirits will be found in the Indian Territory, in Washington Territory, in Montana, and perhaps in Oregon. They enjoy the excitement of being first on the ground, making the first selection and breaking the maiden soil, just

Chat with Readers.

The Management of Large Stones.—A friend at Newcastle, Del., gives his method of removing large stones from the fields. A trench is dug around the stone, and in this a fire is built of any rubbish or trash at hand. Our correspondent says that the heat opens the seams in the stone and it may be easily broken apart into pieces suitable for use in building, etc.

Roof for a Poultry House.—D. H. Davis, Mitchell, Ind., asks us "which makes the best and cheapest covering for poultry houses?"—If the house is to be permanent, it should have a permanent roof, such as shingles, or tin or other metal roofing. A number of roofing materials are advertised; these are of paper or some coarse fabric impregnated with some water-proof composition. We have had no experience with these of late. Some twelve years ago we tried some very popular at the time, and do not care to try any more.

Nest Eggs.—Wm. K. Deisher, Berks Co., Pa., gives us his method of making nest eggs. This is not new, but it will no doubt be useful to many readers. "I use only good sized eggs, with strong shells. I make in the small end a hole about an eighth of an inch across, and in the other end a half inch hole. By blowing through the smaller hole, the contents of the shell will be driven out. Plaster of Paris is mixed with water, thin enough to pour. The shells are to be filled with this, using a spoon to fill them if necessary. When the shells are full, they are set aside for twenty-four hours. Trim off any superfluous plaster with a knife. These eggs are in appearance exactly like real eggs, and being heavy, are not thrown out of the nest.

Leaves as Manure.—W. S. H. Hale, Elk Creek, Va., asks us if leaves are of much value as manure, and how they can best be turned to account when one has nothing to mix with them. Muck and woods-earth, so highly valued as fertilizers, are essentially decomposed leaves, and leaves, if completely decomposed, would have a similar value. Leaves by themselves, thrown into a heap, kept moist and occasionally turned, will decompose, but very slowly. They need the contact of fermenting material to cause them to decompose rapidly. The usual method is, to treat them with stable manure; one part to two parts leaves. If hot-beds are used, this mixture of manure and leaves gives a more gentle and manageable heat, and are preferred to clear manure. Without the aid of fermenting manure, the leaves must have time to decompose and make them available.

The Manure Heap.—"A Subscriber," Evanston, Ill., asks us if we advise throwing all the washing water and slops from the house upon the manure heap. This is uncovered, and added to daily by that which is thrown out from the stable. The reply to this would depend upon the size of the heap, and the quantity of liquids supplied by the house. The heap may be injured if too dry, by burning or "fire-faughing." If, on the other hand, it is too wet, the manure will be shut out from the contact of the air, and consequently can not decompose, and will remain unchanged. The liquids from the house may be in such excess as to cause a washing away and waste of the soluble portions of the manure. The house waste should be utilized, but be under such control, that they may be added to the heap in the needed quantity.

Cranberry Culture in Nova Scotia.—"H. S." writes us from Kings Co. that he proposes to engage largely in cranberry growing this spring, and asks us to send him the names of practical cranberry growers with whom he can correspond. He says that bog lands, with muck from six inches to two feet deep, can be bought at from twenty-five cents to five dollars an acre, but with poor facilities for flowing. Unless the ground can be flowed at will successful cranberry culture is not possible. The best advice we can give "H. S." is to procure "Cranberry Culture," by J. J. White. We do not recommend this work because it is published by the Orange Judd Company, but for the reason that it is a most complete work, giving just what the novice wishes to know, the conditions necessary to success more in full than any other work on a special culture with which we are acquainted.

Shells for Poultry.—A. H. Davis, Mitchell, Ind. In view of the fact that oyster shells are largely and beneficially used for poultry, asks if "the shells of the common mussel, so plentiful in our western rivers, will not answer in place of oyster shells for poultry." He can get any quantity of these shells by hauling them from the river, while the transportation on oyster and clam shells would make them very costly. This is one of the questions that must be answered on general principles. Shells, whether of the salt water oyster and clams, or of the fresh water clams or mussels, known to naturalists as *Unios* and *Anodons*, etc., have essentially the same composition. Shells consist of carbonate of lime, with which there is more or less animal matter. The animal matter in oyster shell is less than one per cent. Probably that in fresh water shells is more, but we doubt if there is any appreciable difference. If near the coast, where oyster and clam shells go to waste, we should use them; if in an inland locality where fresh-water shells would be cheapest, we should use them, with no doubt that they would be equally useful.

Pruning Evergreens.—J. A. Scott, writes us that he some years ago set out a number of Norway Spruces, which are now three to four feet high. He wishes to know if it will injure the trees to cut back the branches about one-third this spring. If pruning will injure them, he would like to know what to do with them. Not long ago it was supposed that evergreens could not be pruned; now it is a

common practice. There is one kind of pruning that should never be given; removal of the lower branches. Our correspondent does not state why he wishes to prune. If the branches do not grow evenly, or if the growth is not stocky and the tree is not well clothed with side branches, pruning will remedy them. In pruning make the cut upon the under side of the branch, beginning the cut towards the center of the tree, and let it slope outwards. Observe to always cut to a bud, so that this will continue the growth. If by accident a tree has lost its leader, turn up one of the upper branches, and tie it in an upright position to a stake.

Saving Much Trouble to Mr. Murphy.—F. Murphy, Clark Co., Ohio, having raised some of the insect powder plants (*Pyrethrum*), and being much pleased with its beauty as a flower and its efficacy in killing insects, wishes to extend a knowledge of the plant to others. He sends us an advertisement, in which he offers, for five cents, to send one hundred seeds of *Pyrethrum*, with directions for cultivation, but says he can only send a hundred seeds, "as I haven't got them." We do not doubt that Mr. Murphy makes this offer in good faith, but we cannot publish it. He has no idea of the trouble that the insertion of his offer would give. He probably has not enough seeds to give the applicants he would have a single seed each. Some twenty years ago we published a few offers to furnish seeds to all who would send a stamped envelope. In each case a request came asking us to say that the seeds were all gone. One conscientious man wrote us that it cost him a sum that he could ill afford to return the stamps that had been sent him. If seeds are worth sowing they are worth buying, and we do our readers a good service in refusing all such offers.

Making Charcoal.—Mr. A. D. Martin, Grand Coteau, La., asks us for the best method for making charcoal. It is more economical to burn the wood in a kiln, than in the old form of a "pit."

The waste is less, and the product more valuable. A round kiln, shown in the engraving, may be twelve feet in diameter, and sixteen feet to the top of the dome. The wall rises perpendicular for half the height, and is then drawn in gradually until four feet across at the top. A flat iron plate fits the top. An iron band is placed around the center of the kiln, to give it sufficient strength. Several bricks are left loose, to be removed to admit air when desired. The doors are for filling in the wood and removing the charcoal. A similar kiln may be made with parallel walls for making charcoal on a large scale.

"How Is Corn Hybridized?" is asked by J. S. Harmon, of Madison Co., Iowa. In the strict use of the word, hybridizing can only take place between different species of plants. As our many kinds of corn are all varieties of one species, when one kind is fertilized by another, the result is not a hybrid, but a cross. Corn has its two sets of organs, male and female, not in the same flower, but in different flowers on the same plant. The flowers at the top of the plant, the tassel, produce pollen only. The pistillate (or female) flowers are concealed within the husks, but hang out their long pistils (the silk) to receive the pollen. If our correspondent wishes to experiment with corn, he should select the kind to be the seed-bearer and the one which is to fertilize it. These two kinds may be planted near together, but at a distance from all other varieties of corn. As soon as the corn selected for seed-bearing shows that a tassel is forming, it should be cut away; this will prevent the silk from being fertilized by its own pollen, and if far enough from other kinds a complete cross will be produced. When a cross is thus obtained the seeds should be sown where other kinds can not fertilize the plants. By selecting the most desirable seed year after year, and allowing the seeds to be self-fertilized, a new variety may be established.

Afraid of Mullein.—"J. W. Appleton," Munroe Co., West Va., writes us that he is clearing a great deal of land, upon which the mullein appears so thickly that he is afraid it "will choke out the grass." He has looked through all his back volumes and finds nothing about mullein, and asks us what he shall do. Mullein is a biennial plant, which produces a vast number of seeds. The seedlings are engaged, the first year, in preparing for flowering the next. The first season the leaves form a rosette, which lies close to the ground and is not very noticeable, but they are quietly storing up material in the root. When the second spring opens the plant appears in full force. The quiet work of the previous year now shows itself in the vigorous flower stalks, four feet or more high, the upper part crowded with flowers, which are followed by pods, each containing numerous seeds. There is no specific method of killing mullein, or any other weed, but we must treat all weeds according to their manner of growth. A blow of a sharp hoe will cut off the tuft of leaves and prevent preparation for the second year. As a precaution, cut down at once all flower stalks that appear and not wait until a crop of seeds is ripe and ready to be scattered. It is a comfort to know that the plant does not endure beyond the second year. If the flower stalks are removed, the ground cannot be re-seeded, and the pest will die out. Its going may be hastened by killing the young plants.

Sorghum Sugar in Kansas.

E. B. PIERCE.

Sorghum sugar making received a decided impetus the past season from the success attained at the two manufacturing factories located in Central Kansas, one at Sterling and the other at Hutchinson. Thousands of barrels of light brown sugar were made at these establishments, and its uniform quality and the certain results daily secured without a single failure, demonstrated conclusively that the manufacture of sugar from sorghum is at last getting beyond the domain of mere experiment. Of the two, the Hutchinson works are on the most extensive scale. Their crusher, fed by an endless carrier, is capable of expressing the juice from twenty-five tons of cane per hour. Five large boilers furnish power for the machinery and heat to evaporate juice.—Under the most favored conditions, the standing cane has been cut, and its sugar and molasses packed into barrels within the same twenty-four hours; but as a rule it was found necessary for it to stand from one to ten days in order to crystallize before going into the centrifugals. These are simply machines for separating the crystallized sugar from the uncrystallizable syrup by the aid of centrifugal force, and have been in use in Cuba and Java and on all large sugar plantations for several years past. A hollow cylinder, three feet in diameter, making one thousand revolutions per minute, will throw the mixed sugar and molasses to its circumference with a force greater than five hundred times its own weight, and striking against the fine sieve on the circumference, the yielding syrup goes through while the sugar is retained on the inside. By this means from one hundred and fifty to two hundred pounds of sugar is separated from an equal amount of molasses in about fifteen minutes. The Hutchinson mills have four of these centrifugals and have turned out four barrels of bright C sugar per hour, including stoppages, or forty barrels per day of ten hours.

Then the main question of securing sugar from Sorghum is now one of capital and business management. The same means that insure success in conducting a creamery will insure it here, while the outcome of the latter is vastly more remunerative as a few figures will show. As an illustration of the possibilities, take an acre of ground planted with the best variety of Sorghum, "the Links Hybrid." If carefully cultivated it produces twenty to forty tons of cane per acre, according to season and fertility of the soil. The Early Orange variety yields fifty to sixty pounds of sugar to the ton; the Amber, seventy to seventy-five pounds, and the Link's Hybrid, ninety to one hundred pounds—all weighed with leaves and seed on. Now the Link's Hybrid is worth at the mill, leaves and seed on, delivered the same day as cut, two dollars per ton, or for twenty tons, forty dollars per acre. At the mill the acre will yield:

2,000 lbs. sugar, @ 5c.....	\$100.00
2,000 lbs molasses, @ 2½c.....	50.00
30 bushels of seed, @ 40c.....	12.00
Total gross product.....	\$162.00

Now wherever coal can be laid down for two dollars and a half or three dollars per ton it is a cheaper fuel than to prepare the bagasse for burning, but this has to be got out of the way. The highest result would be obtained if another factory were at hand to transform it into paper stock for the many articles for which this stock is coming into use. Boards for finishing purposes are now made from straw at Lawrence, Kans., and shipped to Chicago, the greatest lumber market of the world.—One average acre of wheat straw will make two thousand feet of lumber, but as bagasse is better for this purpose than straw, and the yield many times more to the acre, it must eventually take its place. This lumber can be made in any color to imitate any kind of wood, and be made water-proof or fire-proof. As it can be formed at once into any shape without waste of material it promises to be the future material for furniture, musical instruments, building, etc., etc. The immense alkali deposits of the plains will furnish the needed soda.

The Hutchinson sugar mills have a capacity in a good season to work over two thousand acres of cane. This, according to the above estimates, would give a product almost surpassing belief, say four million pounds of sugar, worth two hundred thousand dollars at five cents per lb.; as much molasses, worth one hundred thousand dollars, at two and a half cents per pound; sixty thousand bushels of seed, worth twenty-four thousand dollars at forty cents a bushel, and four million feet of lumber worth one hundred thousand dollars at twenty-five dollars per one thousand feet, or the total of \$424,000.—The possibilities of the industry are thus imperfectly foreshadowed. A description of the machinery and its cost may perhaps be given in another communication. [Our correspondent takes a very hopeful view of the subject. He has not allowed for the cost of the bagasse-paper-wood machinery. Ed.]

Confining the Cow's Switch.

The best method of confining a cow's switch during milking, so that it shall not invade the milk pail, or disturb the milker while at work, has probably not yet been discovered. Tying with strands of hair to the leg, confining with a loop of rope over the loins, or fastening upon the knee,

THE PLANTER.

with the fore arm, might answer for last year, but it will hardly do for the progressive year of '84. In this year of grace, we have it thus: Seated at the cow with the milk-pail between the legs in the old fashioned way, drop the switch between the side of the pail and the calf of your left leg, and, with a firm pressure of the leg against the pail, you have the bush completely under your control. This does not interfere with the security of the pail, or with the free use of the arms in milking. It works well. The only patent on this is issued from the office of the *American Agriculturist*. Try it.

Southern Plantation Life.

Last summer the writer enjoyed for a couple of weeks the hospitality of one of the fine plantations in Virginia, and the novel and picturesque impres-

"LITTLE MISSEE."

sions of its daily life are of the most enduring character. Our host was a gentleman of the old school, and his household was organized upon the patriarchal system which prevailed "before the war." He ruled his family and subjects like a king, but his sway was gentle and humane, and he enjoyed a popularity which nowadays falls to no

real king.—The "old master," as he was generally spoken of, directed and supervised the operations of his miniature State very much as a general does his army. He had a lieutenant in the person of a stalwart and intelligent overseer, who previous to the emancipation had been his slave. "Captain Bill," as he was called, was one of the most thorough drillmasters I ever encountered. Serupulously accurate, and severe but just, under his control the labors of the plantation were performed with the exactitude of a machine. Upwards of a hundred field hands were divided into bands, each under a sort of corporal who received his orders from Captain Bill, and his movements were subject to general orders from headquarters. The result of this system was a model establishment, one having few equals on the continent.

The laborers received a stated sum per day the year round, and were furnished with homes on the plantation and certain staples of food. Their houses formed a little village on the border of a grove of oaks grown gray with the moss of more than a century. These dwellings, erected from designs by the proprietor, were picturesque and comfortable. A distinctive feature of the village was a larger house devoted to worship, education, and merry making.—The characters familiar from descriptions of a plantation in the olden time were still present here. "Young Massa" rode to school every morning, and every afternoon tipped his chair back on the verandah to smoke his Virginia reed, and study. "Little Missee" was in special charge of a black nurse, whose features were wreathed in a perpetual grin of mingled pride and importance at the responsibility imposed on her. There was "Uncle Anthony," the sable hued, frosty haired old butler, who was in a stew over the internal economy of the household, and waged constant war with the cook upon whose domain he persisted in intruding, much to her disgust. Next to the cook the children were his pet grievance. They were always doing or breaking something, and "dem bressed chillum agin" was his regular complaint every day.—These children were a characteristic accessory of the plantation. In all varieties of color, from white to coal black, they swarmed about the house and in the village. If the young master and his pet hound took

to the fields bird hunting, a train of admiring juveniles followed them; if the mistress chattered with a pedler on the porch they gathered around with broad grins and flashing eyes; and the old master never made his rounds, or held a conference with a visitor in the door-yard, without a gaping throng of puny attendants. The wonder was not that "dem bressed chillum" gave Uncle Anthony so much trouble, but that they gave him so little.—He was an ordained minister, and on Sundays conducted service in the village chapel. Sometimes a visiting elergyman of the same sort would officiate, and then Uncle Anthony assumed general control of the congregation. As the visitor was always entertained at the expense of the master, whose hospitality was famous, these visits were by no means few or far between.

Captain Bill led the merry-makings of the plantation, as Uncle Anthony did its worship. He was always first in every scheme of gayety. A portion of the expense these events entailed was borne by the master himself, Captain Bill contributed a share, and the rest was assessed on the participants. The Mistress of the house bore her share of the burden, by the care of its dependants. Under her direction a School was maintained for the home children. The teacher was a young woman of color, pretty and intelligent, who occupied a room in the plantation house and ate at the master's table. The rudiments of English were the chief knowledge impressed upon her pupils, who also made regular classes in sewing. Among these

pupils were a couple of old men, far past the age of active labor, but still ambitious to improve themselves. There was something absolutely pathetic in the spectacle of these battered graybeards, sitting among their grandchildren and painfully plodding through simple lessons which to the youngsters were mere play.—The ordinary day school

"DEM BRESSED CHILLUM AGIN."

and the Sunday-school kept the teacher busy. Over both the mistress presided, instructing especially bright scholars in advanced tasks. Another branch of education was attended to by a young mulatto man who travelled from plantation to plantation, giving a weekly music lesson at each. The well-known adaptability of the colored race to such instruction was shown here. The children formed a chorus for the execution of the simple melodies of the plantation and the camp-meeting, which I have never heard excelled anywhere else.

The admirable provisions for the care of the sick struck me especially. A telephone extended to the

"YOUNG MASSA."

study of one of the doctors of the district, who lived a mile away, and for every serious case he was promptly summoned. Ordinary cases were cared for by the master on the spot. Every morning he received a deputation of the ailing, who were commonly afflicted with the simplest disorders, of which they gave, however, the most ex-

A SOUTHERN PLANTER'S HOME.

Drawn and Engraved for the American Agriculturist.

traordinary descriptions. Hypochondria is a common weakness of the laboring classes, black or white, but in the former it is exaggerated to a whimsical degree.—The less serious ailments were treated out of the medicine chest. For some complaints pills made of bread and mustard were found an effective remedy; imagination performed the rest. Epsom salts was the most popular remedy, as the bulk of the ordinary cases simply came

from overfeeding. The plantation fed its colony. Corn was grown for milling and for feeding the stock, and beef cattle and pigs raised in patriarchal abundance. One day a week in winter and in summer two were devoted to slaughtering. Rations of meat were then given out, and certain tit-bits sent to the pensioners, the people too old to work. These were distributed under the eye of the mistress and with a view to securing rigid impar-

tiality.—Tobacco was the commercial crop of the estate, for which it possessed the finest land in the district, and its cultivation was carried on with scientific exactness. The admirable system produced crops which made the grower a rich man in spite of the liberality which characterized all his relations with his people. "It is an extravagance which pays," he said; "willing hands do good work; if my hands are not willing ones it is not my fault."

Ducks.—Duck Houses.

BY D. Z. EVANS, JR.

Ducks require rather more care than they generally receive. Under good treatment, and where there are sufficient water privileges, they can and do pay better than almost any other kind of poultry bred for market purposes. Fig. 1 shows one of the oldest forms of duck houses, still largely used, as it is cheap, easily made, and is neat and comfortable. It is merely a night shelter, and is too dark for them to remain in any longer during every twenty-four hours than is absolutely necessary. A very convenient size to comfortably contain twenty or twenty-five ducks, is eight feet long, four feet wide, and four feet high at the peak. A hinged entrance door is in front, and if desired a large one can be made of part of the house roof. Being merely set upon the ground, it can be moved from one part of the plat to another, with little trouble. For large ones, some have the sills made like sled runners, and move them with a horse. One-inch common pine boards answer well, either tongued and grooved, or battened over the joints to shed rain.—Fig. 2 is a very good and inexpensive duck house. About half of the south or southeastern front is sash, hung on "loose-butt" hinges, so as to be open or closed, or to be taken off without removing the screws from the hinges. Size, ten to twelve

Fig. 1.—OLD FORM OF DUCK HOUSE.

feet long, four to five feet wide; front high three feet. The roof having small inclination, needs to be well jointed, and the joints battened, or tarred sheathing paper used, to prevent leakage. If desired, the posts for the front corners can be planted in the ground, which will give firmness, and cost less than framing.—Fig. 3 shows a more substantial and more expensive duck house. Length, eight feet, or longer if desired; four feet wide; high,

Fig. 2.—AN INEXPENSIVE DUCK HOUSE.

five feet in front and two feet in the rear. It has a sash two by five feet in the front, which should face the south. A door for the ducks is made in one end; and a large door for the breeder's use in the opposite or the same end. For the cheapest construction, set corner posts in the ground, thus saving framing. If there should ever be occasion for removing, the posts can be sawed off at the ground surface.—Figure 4 presents a still more

Fig. 3.—A MORE SUBSTANTIAL DUCK HOUSE.

expensive duck house, which may have either a round or double pitch roof. Making it seven feet high, gives about two feet space above the eaves for a pigeon loft, where many a fine bird can be reared. This may be covered with tin, or sheathing; canvas (good second-hand will do) thoroughly painted before and after it is applied, with any good outside paint, will make a substantial, dura-

ble, wind and waterproof roof. Sash should occupy most of the south end, to admit warmth and light. A large door is in the north end; the duck entrance can be placed where most convenient. A ventilator in each end at the peak, is needed for

Fig. 4.—DUCK HOUSE WITH ROUND ROOF.

the health and comfort of the ducks. The writer has occasionally learned to his cost, that a hook and padlock are not an unnecessary ornament.

Why Farmers Fail to Raise Melons.

Many farmers in the more Northern States fail in the melon crop. The vines grow, blossom, and bear fruit perhaps, but it is small and poor in quality, often unfit for cattle feed. This frequently occurs in the same locality, and on the same kind of soil, where a skillful gardener raises melons of good size and finest flavor. No doubt melons can be grown more easily in a southern than in a northern climate; but it is true of this crop, as of many others, that it reaches its highest excellence in the northern limits of the belt where it will mature. For example, the Valley of the Connecticut River, especially in Hartford county, is somewhat famous for its fine watermelons. There, as in some other localities, the facility for marketing them by a near navigable stream has led to their cultivation as a staple crop. But certain it is, the sandy alluvium abounding in that valley is admirably adapted to melons. A common cause of failure with this crop, is the lack of sufficient manure. One puts a shovelful of manure under the seed, without care for the rest of the ground where the roots are to penetrate and seek most of their food. The melons are gross feeders, and require much water to supply the abundant juices and large evaporation from their extensive leaf surface, while the northern season is none too long for them. They grow with great rapidity in hot weather, and the most must be made of the summer months, by supplying them with all the food they can appropriate; it should be broadcasted with plenty of well-rotted stable manure, and plowed as long before planting as possible, that it may be well diffused through the soil. Early in August we visited a garden where the melon patch, about a quarter acre, had received twelve cartloads of manure, of about a half cord each. The melons apparently never suspected they were not growing in the tropics. There were plenty of them, and of Cassabas, and Nutmegs, beautiful to the eye, and melting upon the palate. There is great satisfaction in raising fruits perfect after their kind, only possible in northern climates, with abundant manure.

Another trouble with many farmers is indifference to good seed. A melon is a melon with them, whether it is a scrub or a thorough-bred that has had a gardener's care and been raised from selected fruits for a dozen years. There is as much difference in melons as in other products of the garden. The old-fashioned musk-melon, that was popular fifty years ago, is hardly worth raising. A well-grown "Nutmeg," or "Cassaba," or "Black Spanish" watermelon is a feast of fat things, that lingers in memory. Like begets like in the melon patch. Fighting bugs, giving room for the spread of vines, thinning the plants to two in a hill, and frequent cultivation, are other important points in this husbandry. Melons of the best flavor and in plenty, for home use and market, are within reach of every farmer two months in the year. Look after the seed and fertilizers now.

Red Hogs.—Their Standard and Future.

COL. F. D. CURTIS.

The breeders of red hogs have organized an association, uniting the New Jersey family, called "Jersey Reds," and those of New York, known as "Durocs." The latter have been mostly bred in Saratoga county, though quite common in Washington and Rensselaer counties. The name agreed upon is Duroc-Jersey, which unites all interests, giving a foundation broad enough for all concerned. The following standard adopted, is more for the typical hog, than a representation of the red hogs as they are now generally bred. The true Duroc-Jersey hog should be long, quite deep-bodied, not round, but broad on the back, and holding the width well out to the hips and hams; the head small, compared with the body; the cheek broad and full, with considerable breadth between the eyes; bone, not fine nor yet coarse, but medium. The legs should be medium in size and length, but set well under the body and well apart, and not cut up high in the flank or above the knee. The hams should be broad, full, and well down to the hock. The neck should be short and thick, the face slightly curved, with nose short, the ear rather large and lapped over the eyes; the tail thick at the beginning, and tapering to a point. A growth of hair of medium fineness, usually straight, but in some cases a little wavy, with few if any bristles at the top of the shoulders. Color red, varying from cherry red, or even brownish to light yellowish red, with occasionally a small fleck on belly and legs. The darker shades of red, without the black flecks, is the type most desirable. Disposition gentle. When full grown, should dress from four hundred to five hundred pounds; pigs nine months old should dress two hundred and fifty to three hundred pounds.

It will not take long to bring the Duroc-Jerseys up to this standard, and when it is done they will go to the front and stay there, as one of the most profitable breeds. The crossing of the two families together with the united blood already in them, will give them stamina for years, and prevent the "running out," which always follows in-breeding, and too long continuous breeding in a direct line. There is room for this breed, which can now under the care of the association be improved, and also be made thorough-breds. There has been a great deal of loose and mixed breeding of red hogs, which has given them a set-back where specimens have been introduced, as people seeing them supposed they were true types. The Duroc Jersey hogs are in the hands of men of character and experience, who will unite their skill and experience to perfect the breed, and to push it well to the front.

Fattening Coop for Poultry.

The writer has found the following very convenient: Dimensions, eight feet long, three feet wide, thirty inches high in front, and twenty-four

COOP FOR FATTENING POULTRY.

inches at the rear. It is made of inch-thick boards. The interior may be divided into two compartments when desired. The front has at the bottom a board twelve to fourteen inches wide, hung on hinges, to be raised for feeding. This may be cut into two separate pieces, and four hinges be used: The above space is slatted for ventilation; the entire roof is made in two sections, either on hinges or arranged to slide, so as to be easily movable for cleaning out, or removing the fowls. If not planed and painted, the rough boards should be well white-washed in spring and autumn, both to preserve the structure, and promote cleanliness and freedom from insects, as well as for appearance.

Sore Shoulders in Horses.

Farm horses are most liable to have sore shoulders in early spring, when unaccustomed to work. If humanity does not lead to care in prevention and cure, interest will prompt it, for certainly a horse with sound shoulders will do more work than if these be swollen and lacerated.—Prevention is better than cure. The first point is to secure good, well-fitting collars, those of soft leather, of equal hardness on both sides. Many collars are stuffed more solidly on one side than the other, and should be rejected. The horse should be fitted to a collar at the shop, as two very seldom have shoulders exactly alike. I have often wondered that farmers do not have collars made specially for each horse. The cost would be amply repaid as it is slight compared with the increased service that would thus be secured. I prefer a collar stuffed with hair. The leather should be kept well oiled, especially where meeting the shoulder. Pure neat's foot oil makes the leather soft and pliable, and is a good preventive and cure for sore shoulders. Cloth collars are now made, and cloth pads to cover the entire collar face. I know they are good and recommend them to other farmers.

Early in the spring, at least two weeks before plowing commences, begin bathing the shoulders of each work horse with strong salt brine. I keep in the stalls an old fruit can, and a rag tied to the end of a cob; and it takes but a moment to throw in a handful of salt with some water, stir it up and apply the brine. It toughens and hardens the skin and cools it, allaying inflammation. I do this each evening; after work begins I first wash off the shoulders with clean water. I have never been troubled with sore shoulders since I have taken to carefully selecting collars, keeping them soft with oil, and bathing frequently with the salt water.

The best cure for sore shoulders is rest, and this may be secured without stopping work, by removing the pressure from the irritated spot. One method is to cut a long, narrow slit in the hame groove opposite the soreness, remove part of the stuffing and make a little depression by pounding the face over the sore. The slit will not injure the collar. Another method is to use pads above and below the tender spot, to keep off the pressure. After considerable experience I consider the best pad one made by stuffing a coat sleeve with hay, about one inch thick between the collar and shoulder, but thinner where it passes under the hames. Hay works into lumps less than rags, hair or wool, and is elastic enough to spring the collar from the shoulders when the draft slackens, giving them opportunity to cool and rest. J. M. S.

Dimensions of Cisterns.

In answer to inquiries about the filtering cistern described on page 571, December *American Agriculturist*, we reply: In a stiff clay a small cistern of twenty to forty barrels capacity might be safely cemented directly on the earth, but in ordinary soils and for larger cisterns, a good four-inch wall of hard brick is on the whole the cheapest. It is important to make the excavation smooth so that the bricks can be pressed firmly against the earth; otherwise these will be pushed out and the cement cracked, causing a leak.—As to the dimensions, we prefer a cistern about one-fourth deeper below the spring of the arch, than its width inside. By this rule a cistern eight feet wide will be ten feet deep below the arch. We have always used for the top a cast iron ring twenty inches in diameter, for the man-hole, covering it with a tight fitting cast-iron lid. The ring has a flange two inches wide extending out over the brick. The capacity of a cistern needed to save all the water from a given extent of roof, will depend on the total annual rainfall, its distribution throughout the year, and the regularity with which it is used. A roof ninety feet by twenty feet contains eighteen hundred square feet. This is supposed to be the measure of the building on the ground and not the shingled surface. In the vicinity of New York the average rainfall is

about forty-two inches, or three and a half feet. This would give sixty-three hundred cubic feet of water (1,800 ft. x $\frac{3}{4}$ —6,300). Since in that climate the rain is distributed pretty regularly through the year, it would be necessary to only provide storage capacity for about one-third of the rainfall of the year, or twenty-one hundred cubic feet. This divided by four and one-fifth (the approximate number of cubic feet in a barrel of thirty-one and

Fig. 1.—SIDE OF PIGGERY.

a half gallons) gives five hundred barrels, and this quantity of water requires a round cistern thirteen feet diameter to be nearly sixteen feet deep below the arch, or a square one thirteen feet across to be nearly twelve and a half feet deep; or a round one fifteen feet in diameter would need to be about twelve feet deep. In the Far West—in fact, in most places west of the Missouri—the rainfall is largely during the six months beginning with March, and cisterns need a greater storage capacity.

A Complete Frame Piggery.

BY W. W. MAUGHLIN, BOYD'S STATION, MD.

The piggery shown in figures 1 to 6 is fourteen by forty feet; corner posts, fourteen feet; height of first story eight and one-half feet; second story,

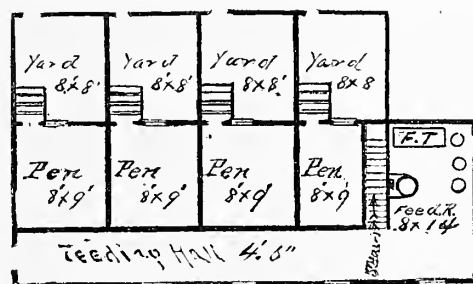

Fig. 3.—GROUND PLAN OF PIGGERY.

five feet from floor to top of wall plate.—The first floor has two thicknesses of inch boards, a foot wide, the lower boards running lengthwise of the building and the upper ones crosswise. The walls also are two layers of similar boards, the outside ones perpendicular, and battened with inch strips three inches wide. Second story floor is one thickness of narrow inch boards, tongued and grooved. Stairs to second story three feet wide. All the doors are battened. One twelve-light window in gable end, and one in feed room.—Each pen has a window opposite it, across feeding hall (shown in figs. 1 and 3) and a sliding sash at the rear, seen in fig. 3. Between each pen and its yard is a batten sliding door, two and a half feet wide, four feet high; and at the outside of each yard is a door three by six feet either on hinges, or to slide. Height of yard fence, six feet. From each yard to its pen is an incline of two-inch plank, with inch strips three inches wide well nailed on to prevent pigs from slipping.—The feed troughs run across at the front. The partitions, five feet high, between the pens and over or in front of the troughs, swing as seen in fig. 5. The hinged stick, A, fig. 6, props the swinging

Fig. 4. SECTION OF TROUGH.

partition back, when cleaning out troughs and supplying feed (slops), as seen in figure 4; and it falls back on removing the stick (fig. 4). However, the partitions dividing the pens and yards can be made either stationary or to swing, the latter being preferable, as this will allow all the pens to be thrown into one large one, and the same of the yards. The feed room is provided with a brick chimney, an iron kettle, a large wooden box for

partition back, when cleaning out troughs and supplying feed (slops), as seen in figure 4; and it falls back on removing the stick (fig. 4). The feed room is provided with a brick chimney, an iron kettle, a large wooden box for

Fig. 2.—END OF PIGGERY.

mixing feed, slop barrels, etc. The entry doors to this are made wide, to admit a slop barrel on a wheelbarrow.—If the yards are planked on a level with the floors the incline can be dispensed with.

Materials and Cost.

TIMBER: Sills, 6 by 8 inch, four, two 40 feet long (or shorter ones spliced), and two 14 feet—152 feet. Four corner posts, 4 by 4 inch, 14 feet long—75 feet.—Plates, 3 by 4 inch, two 40 feet (or shorter ones spliced) and two 14 feet long—108 feet. Five pieces for swinging partition posts, 4 by 6 inch, 8 feet long—80 feet.—Ten posts for outside partition walls, 4 by 4 inch, 8 feet long—107 feet.—Fourteen fence posts, 4 by 6 inch, 8 feet long—224 feet.—Forty-two floor joists, 2 by 8 inch, 14 feet long—882 feet.—Forty-two rafters, 2 by 4 inch, 11 feet long—308 feet.—Twenty-one pieces, 2 by 4 inch, 8 feet long—112 feet.—Eight pieces, 4 by 6 inch, 14 feet long, for joist beams—224 feet.—Twenty-seven pieces for ledgers and frame rails, 2 by 4 inch, 16 feet long—238 feet.—TOTAL framing timber, 2,848 feet (board measure) @ \$14 per 1,000 feet, \$39.87. Rough boarding, 1 inch thick; 968 feet sheathing; 1,120 feet flooring (1 foot wide, 14 feet long); 3,220 feet weather-board ing; 1,312 feet for swinging partitions, fence, troughs, etc.; 124 batten pieces 1 by 3 inch, 14 feet long (434 feet); 76 pieces, 3 inches wide, 8 feet long, for braces for swinging partitions (203 feet).—TOTAL, 7,257 feet @ \$17 per 1,000 feet, \$123.34. 800 feet dressed lumber, 1 by 4 or 6 inches, tongued and grooved, for doors and 2d floor, @ \$20 per M. 16.00 5,000 shingles, @ \$3.90 per M. 19.50 2 windows, 12 light, 8 by 10 inches. 3.00 10 windows, 6 light, 8 by 10 inches (sliding sash). 7.50 3 door frames, 3 feet by 6 feet 8 inches. 5.25 Bricks for 8 by 8 inch flue, etc. 26.30 Hardware, sash hinges, nails, etc. 5.00 Materials for and painting. 10.00 Carpenter work. 110.48

Total cost of Piggery. \$366.24

INFLUENCE OF PLACIDITY ON THE SECRETION OF BUTTER FAT.—During the remarkable public test of the Jersey cow, "Value 2d," when she gave over twenty-five pounds of butter in seven days, it was found that one day she produced one pound less butter than upon the preceding and following days. This, of course, led to enquiry and speculation as to what could be the cause. It was

Fig. 6.—FRONT OF TROUGH.

found that, after being turned out as usual, to spend the night in a small pasture with two companions, threatening clouds came rolling up with muttering thunder, and so, rather than expose

"Value 2d" to the storm, she was brought into her roomy stall, with cows upon every side of her and all things very comfortable, and a manger full of green fodder besides. Still she worried a little and called for her companions. Though she fed well, and appeared all right, she fell off in her butter yield just about one pound. This and some other confirmatory observations lead me to think that the mental condition of the cow may have more to do with her butter yield than the kind of feed. w.

Convenient Extra Wheel Barrow Handles.

Mr. Avery J. Northrup, Delaware Co., N. Y., sends us a sketch and description of an attachment to

the ordinary wheelbarrow, easily supplied, which he has used quite satisfactorily for twenty years. It is his own device, and unpatented. Two plow handles are obtained from a factory ready bent, or handles from a broken plow will answer, or they may be worked out of two pieces of wood of suitable form. To save weight the plow handles are dressed down quite light except where the bolts go through, and are cut to the desired length. Bolt the straight ends to the legs of the harrow near the bottom, raise them up so that the curved ends will be three or four inches below the closed hands when one stands upright with the arms down, and bolt them to the ordinary hand shafts. —By using these supplementary handles the box is carried nearly level, when filled with fruit or sand, etc. When wishing to elevate the rear of the box, the lower handles of the barrow may be used.

A Destructive Farm Bird.

The Great Horned Owl is the third in size of the sixteen species of owls found in the United States, the largest being the great Gray Owl, and the second the Snowy Owl. But as the former inhabits the extreme Northern States, and the latter visits us only in severe winters, they are far less destructive to poultry than the Great Horned Owl (*Bubo Virginianus*), which resides over the greater part of our whole country. A farmer living not many miles from Philadelphia, owned a flock of turkeys which roosted in a partly open shed. On four successive mornings a turkey was missing, and fearing the loss of his entire flock, he lay in ambush for the thief. His shot broke the wing of a Great Horned Owl, as it was noiselessly entering the turkey shed. He kindly boxed this owl and expressed it to me. It was a large specimen, measuring two feet one inch from the tip of bill to end of tail. Evidently turkey suppers had agreed with him. I had him in captivity for several months, and later, another of the same species. While in my possession, these owls were fierce and untamable, and never once expressed any good feeling or attachment towards me, or to others who fed them and treated them kindly. Any attempt to stroke or touch them, was invariably met with a savage snap of the bill. Many animals after being in captivity for a time, become reconciled to their fate, and give up attempting to escape, but not so with these owls. The first one repeatedly bit entirely through the wooden cage bars; and the second, which I had fastened by a strong brass chain to a perch, several times forced apart the links with his powerful beak, and made off. One of his wings being clipped, he was unable to make long flights, but we always found him in the morning perched high on the grape arbor, among the vines. It was a difficult, if not a dangerous job to bring him down, but we always accomplished this by first throwing a piece of thick carpet around him. More than

once his sharp talons have pierced through the carpet. The approach of a dog or a cat would always put them both in a rage, when they would puff out their feathers, lower their heads, spread the wings, and savagely click their bills, thus making themselves appear terrible animals, when puffed up to very far beyond their actual size. A dog that used to take pleasure in going to the cage of my first owl, and arousing his ire, once received a clutch in the nose, and never after this could he be induced to go near his owliship. They would eat almost any kind of meat, beast, bird, or fish. Even a screech owl, (*Scops asio*), a blood relation, was devoured by one of them with an apparent relish. These owls could see at all times, but best at the dusk of evening, or in the moonlight. This species, besides being the most noteworthy robber of the roost, feeds upon rabbits, opossums, pheasants, partridges, etc. Their favorite residence is the dark solitudes of deep swamps, covered with thick, tall timber. Here they nest and rear their young. The nest is generally composed of sticks and leaves, carelessly put together, and placed in a high fork of a tree, where the top has been broken off. The eggs of the Great Horned Owl are two to four in number, nearly spherical, two and a quarter inches in length, and of a dirty-white color. C. FEW SEISS.

A Fish Trap.

Though trapping fish is frequently forbidden by law there are many fish-abounding streams, especially in newly settled regions, furnishing a supply of excellent food at some seasons. Fish are often taken most economically by means of a simply constructed trap. A common method is shown in the engraving. Selecting a convenient place, usually the main channel, four or six posts are driven and covered on the two sides and the upstream end with lath nailed just close enough together to stop all fish large enough for use. The space enclosed may be twenty to forty inches wide, and three to six feet long, according to circumstances. At the lower end, lath are nailed on with their inside ends approaching each other to form a funnel, leaving the opening just large enough for the fish to pass easily. Weirs or walls extend from each side to the main hanks. Stopped by these and bent on going up stream, the fish follow along them to the trap opening, which they enter, and seldom find their way back through the narrow aperture. They may be taken from the trap with a dip-net, or by hand. The weirs may be of loose

A TRAP FOR FISH.

stones or driven stakes or brushwood, to allow the passage of considerable water through them when it rises; or they may be of earth, logs, or driven boards or slabs, as the material, character of the stream, the permanency of the structure, etc., indicate in each case. The occurrence of freshets is to be taken into account. By lengthening the box or pen a second funnel may be made at each end to arrest the fish going down stream as well as up, though the upper funnel would catch floating material and soon clog, and it may be best set in at one side as the fish would usually find it. They ascend the stream as the spawning season approaches, which differs with the varieties. Their descent occurs at a later period in the season.

Profit in Pig Feeding.

Feeding pigs for slaughter during winter, the time frequently chosen, is much oftener done at a loss than at a profit; this is especially the case in colder climates, except when a chance increase in price and a demand for and good use of the manure may help out. It need not be so, if farmers generally understood the necessity of and provided for proper warmth. The heat of the body in swine, as in all other animals, is only kept up by food, and when the surrounding cold carries off more of the heat than the food consumed and digested can produce, there is little if any left to go to increase of flesh and fat. —Of two lots of spring pigs, I had one lot ready to slaughter at the beginning of winter, and concluded to keep the others along. They were kept in an enclosed shed and given all the corn they would eat. They consumed just enough to keep up warmth and locomotion. Even this was too heavy a draft upon their digestion and assimilation to have them in a normal condition, and they did not really hold their own. Only a higher market the last of February enabled me to realize even as much for this lot as for the other. It may be set down as a rule, that there is no profit in feeding pigs for slaughter in winter, where the food will freeze in the ordinary weather.

But during the past winter I fed a number of pigs at a decided profit. They grew as fast as the autumn fed, their entire gain from a moderate condition was made in cold weather. Two of them weighed over half a ton. They were kept in a pig house so warm that it rarely freezes! They were fattened mostly on rye meal and huckwheat bran. Queer feed, some farmers will say, but it is capital for fattening, as noted below. I once tried a coal stove in my pig house to save a lot of early pigs, but they became sickly and did not do well. What is wanted is to have the building close and tight enough to keep out external cold, leaving the inside to be warmed by animal heat. A basement under the pig house can be turned to good account for fattening pens.

Something more than mere stuffing with food is required, if rearing and fattening of pigs is to be made desirable. Food and labor are becoming more costly every year, and to make this important industry profitable, there must be corresponding reduction in losses, to be secured by more economic surroundings, and making a little of the more expensive food go as far as possible in making flesh. The first requisite is comfort, as without this no animal will thrive well. Let it be well understood, that cold and filth are destructive to success. Arrangements to save labor are of increasing importance as above noted. As to food, one kind only of concentrated diet, without change, will break down any young pig's stomach, and produce a feverish state in an older one; it is unnatural for an animal naturally constituted to eat everything. Concentrated rich food needs a combination with coarser kinds, to render it less compact and allow a more ready penetration of the gastric juices. How can healthy action be maintained, if the intestines of the animal contain only a mass of fermenting, putrefying stuff? I never had autumn dropped pigs grow so fast, or show so healthy a condition as two lots of different breeds fed this winter on huckwheat bran. They are in a warm pig house, where it seldom freezes; the coarser part of the flour left on the hulls supplies food for the stomach, and the hulls keep the intestines in a healthy condition. Few farmers think of this latter point, and confine their pigs to clear corn meal, the most heating and unhealthful of all the cereals. Corn is the great staple food for hogs, and will continue to be, but it should be utilized to the best advantage by judicious combination with coarser food, for swine as well as for men, and for breeding as well as growing and fattening animals. A feed once a day to fattening hogs of carrots or beets, increases the appetite, gives tone to the stomach, and has a cooling effect upon it. More roots, or other cheap succulent food is required. F. D. C.

Horseradish from Seed.

A correspondent inquires of us whether Horseradish can not be raised from seed, and where the seed may be procured. It grows very readily from cuttings of the root, the least fragment producing a plant, and has been multiplied in this manner for many generations. There being no use for seeds, the plant has ceased to produce them. None, so far as we are aware, have ever been found on the plant in this country. It is probably sterile in Europe also, as a botanist in France states that

climbers, the query is one that calls for a general answer. The injury done by the Ivy and most other climbers is entirely mechanical. Vines are provided with different appliances to assist them in holding fast to trees. The Ivy, the Poison Ivy, Trumpet Creeper and others, have little roots along their stems; these roots do not, as some suppose, penetrate through the bark and live upon the sap of the tree. They only enter the crevices of the bark, and soon lose their root-like character, becoming hard and wiry, and serving merely as hold fasts. Other vines have tendrils, either a modified

preciable injury, we should prefer to transplant the climbing vines to some other less valuable trees.

The Carrion Flowers—Stapelias.

Among the many plants sent us for a name, no others, within the past year or two, has come more frequently than the Carrion-flowers, as the Stapelias are often called. As seen by the engraving (one-third of the real size), the plants have a very striking appearance, which is sure to excite a curiosity to know the proper name. The plants

HORSE RADISH IN FLOWER.

he had watched the plant for some forty years without finding a single ripe seed. According to him, the flowers produce no good pollen. Neglected clumps of horseradish produce flowers very freely. These are white, and of the shape shown in the engraving, which is much reduced. In the absence of an abundance of other flowers, we have known these to do good service in a bouquet.—There are a number of other plants which are multiplied extensively by means of runners, cuttings, and other methods that produce seeds very rarely, if at all. The sweet potato is one of these, the Chinese yam another, and there are numerous instances among plants cultivated for their flowers. The absence of seed in Bermuda-grass in this country, is probably due to the fact that it spreads so widely by its stems that seeds are not formed, though it bears them in some countries.

Ivy and Other Climbers.—Do They Injure Trees?

Miss L. Griffin, De Soto Co., Miss., writes us that there are on their place two fine Magnolia trees nearly fifty years old. Some young European Ivies have been planted at the base of these trees, and are now growing upon them. She asks if the ivy will in any way injure the trees? As several have asked the same questions about other

branch or portion of a leaf, which cling to the tree. Our Virginia Creeper has branched tendrils, and each branch bears at the tip a little disk, which acts somewhat like a boy's sucker, and forms a hold-fast. Still other plants hold to the tree by twining around its branches. This last class, the twiners, are the most generally injurious, especially to young trees, as they soon become woody and prevent the expansion of the tree, literally choking it to death. One of the most beautiful of our native vines, and one often cultivated, is Roxbury Wax-work, or climbing Bitter-sweet (*Celastrus scandens*); this is especially injurious, and it is not rare to find wild trees with the slender trunk or the branches embraced by this vine, which so constricts them as to cause death. Ivy upon trees is especially frequent in England, and while some of the horticulturists of that country have claimed that it does no harm, others assert that it is a positive injury. Both are probably right. On old trees the bark of the trunk and older branches is rough, scaly, and its exterior really dead, and vines can do no harm. On young trees, on the other hand, the bark of which is smooth, and still taking a more or less active part in the growth, the covering of Ivy or other vines, will arrest development and be injurious to the tree. As to our correspondent's Magnolias, neither Ivy nor other vines can add to their beauty, and even if they would cause no ap-

CARRION FLOWER—STAPELIA.

are popularly thought to be cactuses, as like most plants of that family these have no proper leaves, the green bark of the fleshy stems doing the work of leaves. The stems of the stapelias are four-angled, while in all the cacti with similar stems, there are five or more angles. The flowers are produced along the stems, and as the engraving shows, are strikingly curious in form, while their oddity is increased by the colors; the ground is of a creamy-white or pale-yellow, and spotted and blotched with very dark purple, or maroon color, and present a most lurid appearance. In the bud, the divisions of the flower cohere by their edges, and open by suddenly bursting, especially when the sun shines on them. The flowers can not be said to have fragrance, though they have a great deal of odor, which is so like that of decaying meat as to make the common name descriptive and appropriate. So closely does the odor resemble that of carrion, that flies have been known to deposit their eggs upon the flower. The stapelias are extremely easy to cultivate, as they need only poor soil, and very little water. They are propagated from cuttings of the stem, which should be allowed to dry for several days before setting them out in very sandy earth. The stapelias, of which there are about six species, are natives of the Cape of Good Hope, where, during the dry season, no rain falls for several months at a time,

Huckleberries and Blueberries.

Few not engaged in it are aware of the extent of the berry trade. There are communities in which it is the chief source of income; indeed we have an account of one family of seven in New Jersey, which, by picking berries, earned twenty-five dollars a day throughout the berry season. Where

Fig. 1.—THE BLACK HUCKLEBERRY.

ever there is a favorable berry locality, it allows boys and girls, women and feeble persons, to earn something, in an easy and healthful employment. The market names of these berries vary in different cities. In some places they are all called huckleberries, and are distinguished by their color as black and blue. Those wishing to be very precise say, "whortleberries," but as both this and "huckleberry" are corruptions of the ancient "myrtleberry," both of these names are proper. The great bulk of the berries sent to market is the product of four distinct species, though two or three others afford small quantities. Formerly these plants were all placed in the genus *Vaccinium* (the ancient Latin name), but modern botanists divide them according to the structure of the fruit. If the berry be cut across, especially before quite ripe, it will be found divided into several cells or compartments. The berries having four or five cells, with numerous seeds in each, remain in the old genus, *Vaccinium*, and those with eight or ten cells, and a single, seed-like little nut in each, belong to *Gaylussacia*, a genus so named in honor of a distinguished French chemist. Both genera furnish important market supplies. In order of ripening, the earliest is the Dwarf Blueberry (*Vaccinium Pennsylvanicum*), common on dry hills, especially in northern localities. The bush is from six to twelve inches high, and often so laden with fruit as to lie prostrate on the ground. The berries (fig. 2), are large and sweet, but too tender to carry well. The earliest berry of importance, and ripening a little later than the above, is the Low Blueberry (*V. vacillans*). This is also a plant growing on high lands; the shrub is rarely over two feet high, with yellowish-green branches, and pale, dull leaves. The berry is rather small, very sweet, and covered with a

handsome blue bloom. It is hard, carries well, and is a popular market fruit. The Swamp Blueberry (*V. corymbosum*), is the tallest of all the northern species, being often ten feet or more high. Though its common name would indicate that it is only found in swamps, yet it often occurs on dry soil. The shrub is very variable in its leaves and fruit. The berries are usually blue, and covered with a very thick blue bloom, though one form has a black fruit without the bloom. This is the latest, the largest and sweetest of the blueberries, and is known to the New York market men as "swamps." It is very tender, and does not carry well, especially if sent in too large boxes. The huckleberry of some markets, and black huckleberry of others (*Gaylussacia resinosa*), is produced by a bush one to three feet high. The leaves are thickly covered with small dots of resin (whence the specific name), and if held in the hand, they become very

sticky from softening of the resin. The fruit (fig. 1), of medium size, is very black and shining, very firm, and can be shipped to distant markets. As the large seeds crack under the teeth when the berry is eaten, they are often called in the market, "crackers." Bushes of this species occasionally occur with fruit of a pale reddish, and even a creamy white color. These are the leading market berries, but limited quantities of the Dangleberry, (*G. frondosa*), and the Hogberry (*G. dumosa*), are occasionally met with. The great berry district in New Jersey, is in the coast-wise counties, where there are immense tracts covered with stunted forests, among which the berry bearing shrubs are abundant as an undergrowth. Numerous families resort to these

the root, and in a few years bear more abundantly than ever. While these fruits are found in such abundance in the wild state, it is not probable that their cultivation can be profitable: still, those who have "huckleberry pastures," may do something to improve them by grubbing out other shrubs, thus giving the berry-bearing ones the whole ground; and, taking a hint from the improvement resulting from accidental fires, by cutting over the bushes once in a few years. From what has been done with other plants, it is not unreasonable to suppose that cultivation and careful selection would produce improved varieties of huckleberries and blueberries, as is has with the blackberry. This is a good field for some patient amateur to work.

Kerosene to Kill Insects.—An Emulsion.

Since the illuminating oil obtained from petroleum, known in this country as kerosene, and in England as paraffine oil, came into general use, it has been employed with variable success as an insecticide. That it would destroy insect life was long ago established; that it would also destroy plant life was sometimes demonstrated in a manner more convincing than pleasant. The oil in its concentrated form, can be tolerated by but few plants. The first improvement in its use was to add a very small quantity to a bucket of water, enough to make but a mere film upon the surface: then diffuse it through the water by violent stirring, and apply before the oil and water had time to separate. This answered fairly well, but was troublesome. The next step was to divide the kerosene, not by dissolving it, but by diffusing it in the form of an emulsion. It is well known that oils may be suspended in water by means of gum, sugar, etc., and may be kept thus for some hours or even days. It has been discovered that milk, either fresh or soured, is a convenient medium to unite kerosene and water. Mix together kerosene and half as much milk, stirring them thoroughly to form a cream-like mixture. When the two are so completely united that no oil is visible, dilute the mixture with twelve times its bulk of water, adding the water gradually, and stirring thoroughly. This

Fig. 2.—THE DWARF BLUEBERRY.

places, build a shanty, and camp out during the picking season. The fruit is sold to "carters," who have their regular routes, and at established points take up the fruit and ship it to market. When an occasional fire sweeps these forests, the berry bushes are not destroyed, but spring up from

emulsion has been found especially useful in the treatment of the various scale insects, so difficult to destroy by ordinary insecticides, and is used for various other insect pests. For trees use a syringe or force pump, and for house-plants, often injured by scale insects, apply with a sponge or swab,

The Evergreen Barberries.

Nuttall gave the name *Mahonia* to the Barberries with evergreen and divided leaves, in honor of Bernard McMahon, a gardener in Philadelphia, early in this century. Later botanists, not considering the difference in the leaves of sufficient importance to separate them from the Barberry, now place them in *Berberis*, though as a general thing, they are called *Mahonia* in the nurseries. The common species of our northwest coast, *Berberis Aquifolium*, is the one most generally seen in cultivation, and is an excellent ornamental shrub. The more recently introduced Japanese species, *B. Japonica*, is far superior in size and beauty to ours. The shape

THE JAPANESE BARBERRY.

of the handsomely divided leaves is shown in the engraving. It grows about three feet high. This is not quite so hardy as the native species, and should be given a somewhat sheltered situation. This was at one time called *Mahonia Bealii*, a name that is retained in some of the nursery catalogues.

Suggestions on Ornamental Planting.

BY E. A. LONG.

In planning for ornamental trees, shrubs and plants, it is well to study the utmost capability of single kinds for serving a variety of purposes at the same time. Thus, a particular variety may beautify the grounds generally while serving for shade or for shelter from sweeping winds. It may, at the same time, be an individual of a tasteful group, or be used as a background for other smaller growing kinds, or even to screen some disagreeable object. Further still, in placing it, we may have a regard for striking contrasts with other surrounding trees and shrubs of different appearances, or else for toning up or balancing the general effect of the arboreal and other embellishment of a place. In addition to all the above the tree will undoubtedly have some distinctive qualities of its own, in flowers, fruit or foliage, rendering it specially attractive at certain seasons, and it should be used in a way to best draw them out. These remarks apply equally well to all trees, shrubs and plants used in the adornment of the grounds. Their selection and arrangement, to secure all the results possible, is one of the nicest matters pertaining to ornamental gardening. Those who take the most pains to study the selection and judicious arrangement of material, will be far more likely to secure gratifying results than the haphazard planter. It is time to begin studying up what is to be done the present spring, to consult catalogues and books on ornamental gardening, the back volumes of the *American Agriculturist*, etc. Aside from its practical application, the study of trees and plants is a delightful occupation for all the members of the family, as is the planning of the grounds. The

use of instruments in making plans on paper or linen will develop skill in drawing. Even children encouraged to take part in such occupation will often advance some excellent ideas. If the entire family take part in the planning and selection they will be ready to help along in the actual work. Quite young children may easily be led to take a keen interest, and be kept wide awake on these points.

The Cedar of Lebanon.

In trees planted for ornamenting small or large places, there usually seems to be but little variety, and in this respect, one place bears a general resemblance to another. While there is a very little variety among deciduous trees, with evergreens there is even more sameness. A foreigner might suppose that our climate allowed of the use of but few evergreens, as he sees the half-dozen or so kinds repeated everywhere. The most frequently planted evergreen is the Norway Spruce, a most useful and picturesque tree, but one finds its constant repetition somewhat monotonous. Probably of every hundred evergreen trees planted in the Northern States, about ninety are of this kind. Norway Spruce, Arbor Vitæ, Red Cedar, Balsam Fir and the White, Austrian and Scotch Pines, make up the list of evergreen trees that appear to be generally known to our planters. Even the Hemlock and our White Spruce, native trees, not excelled in beauty by any others from anywhere, are very rarely seen. When a gentleman of our acquaintance was ridiculed for marrying a very large lady, he replied: "You can not have too much of a good thing." Norway Spruce is a good thing, but we find it easy to have too much of it, and it is unpleasant to see this and Arbor Vitæ occupying ground that might be filled by a great variety of beautiful and interesting species. Among the trees very rarely seen is the Cedar of Lebanon, which is desirable for its peculiar beauty, and especially interesting on account of the frequent reference to it in the Scriptures. The young tree has a conical form, but when old it is remarkable for the great length of its branches, which spread in distinct layers, and give the head a most striking

A CEDAR OF LEBANON.

appearance. The tree is quite hardy in the climate of New York City, and in well-drained soil would no doubt endure a much colder locality. When full-grown, it is from fifty to eighty feet high, with

a spread of branches equal to its height; the trunk is often thirty feet in circumference. The wood of the Cedar of Lebanon is perishable, and of little value. The cones are three to five inches long, and are very obtuse; they are made up of broad, flat scales, between which are the flat, thin-winged seeds.

Producing New Carnations.

Those who cultivate the Carnation, generally procure the plants from florists. They are thus

A SINGLE CARNATION.

sure of getting fine varieties, but miss the novelty and interest of growing them from seeds. No

flower more deserves the attention of amateurs, as it amply repays the care given it. To have the finest seedlings, one should raise his own seeds. In the single flower, as shown in the engraving, the styles (parts of the pistil), are quite conspicuous: in a double flower these are concealed by the numerous petals, but may be found by a little search. The very double flowers bear little or no pollen, and are to be fertilized by pollen from a semi-double or single one. Fanciers fertilize the first two or three flowers upon a plant, and remove all the others, as well as the buds. When the petals begin to wither, they are carefully pulled out of the flowers that have been fertilized, otherwise their decay may injure the growing seed-pod. When the seed is ripe, the pods should be gathered and the seeds kept in them until next spring, when they are to be sown. Taking the earliest flowers as seed bearers, and allowing only a few pods to mature, will produce much better seed, and the plants raised from them will be finer than

those raised in the usual way. By continuing this for a few generations, an improved strain may be established. A desirable flower thus obtained may be propagated by cuttings or by layering.

A Plant Stand.

Most of the plant-stands have a series of ascending shelves. If these face the room, the lower plants are shaded by the upper ones, and suffer from lack of light; if facing the window, the lower plants are hidden from view, unless one goes out-doors to see them through the glass. I have a stand, or table, which suits me. It is so low that the tops of the largest pots are just on a level with the window sill. The legs, which are well braced by cross-pieces, like a library table, are of oak, oiled. The top is of pine, and is like an ordinary table, with a strip of pine two inches high all around the edge. This strip answers to keep the pots from slipping or tipping off in moving the stand, and allows an inch of sand all over the table, which absorbs any water escaping from the bottom of the pots, and it gives off a steady supply of

A PLANT STAND.

moisture by evaporation. The table top should be thoroughly painted, leaving no cracks for the water to run through. It is mounted on strong, easy turning casters, and can be readily wheeled out into the room on cold nights. Opposite sides are turned to the window, which saves shifting or turning the separate pots to give both sides of the plants equal light. At the corners, stout iron rods are fastened and bent over the centre as shown in the illustration. On these I have trained vines, which add greatly to the ornamental appearance of the stand. Where the rods cross, a bird-cage or a hanging plant can be suspended. Such a table can be made cheaply at home by any one at all skillful with tools. Its proportion should of course be suited to the size of the window where it is to stand. Such a table can be used in a bay-window with much better effect than the ordinary stand or rows of shelves. Being placed low down, the plants are seen to good advantage, and are easily cared for. The larger plants should be arranged in the center, and the smaller ones along the edges. E. E.

Economical "Making Over" Things.

Many families have a knack of making a little go a great ways, in rendering their homes comfortable, even genteel. Calling upon such a family recently, I at first supposed they had bought some new chairs, but on closer examination found they had been cane-seated walnut ones, too valuable to throw away after the bottoms had given out. The girls had tacked on firmly some strong canvas in place of the cane, then added several thicknesses of the same size cut from an old quilt, and tacked over these stout cotton to hold them in place. A strip of cretonne having stripes of pretty flowers, was stitched across a piece of reps, and formed the covering. When this was tacked on, the edge was hidden with upholsterer's braid fastened with brass-headed nails. The effect was very satisfactory. After the boys oiled the frames, those chairs were really prettier than many expensive ones I know of.—An old lounge, previously covered with hair-cloth, was treated in the same way, with the addition of a sofa cushion nicely embroidered, It

is as good as new, and more attractive than it was previously.—The daughters showed me their "new carpet," made of two others. For the center an old sitting-room ingrain carpet was washed, colored brown, and the best portions sewed together. The border was formed from the best parts of a crimson and black bed-room carpet. The effect is more pleasing, to me at least, than a two-dollar-a-yard, bright-flowered carpet which another neighbor had just laid down. R.

Home Hints for Spring.

The holidays over, the short winter days lingering longer in the twilight remind the good housekeeper that now is the time to take account of stock, and to have all the plain sewing planned, and as far as possible finished, before warm weather.

Fashion changes little in bedding. Sheets and pillow cases can be cheaply bought ready made by machine, but they look much nicer when hemmed by hand, and wear better. Trimmings of cheap cotton laces on sheets or pillow cases are in bad taste. Shams are desirable to dress beds which are in use all the time, but they should not be too elaborate. Little trimming, and that very nice, is much preferable. It is fashionable to remove pillows by day, and leave only the bolster on the bed, with handsome spreads of silk or lace. Very many are making silk quilts of patchwork, and several manufactories supply bundles of pieces which are sold for this purpose. They are not the set figures of our grandmothers' times, but a lining is cut and the pieces are based on, large and small, without any design except to harmonize colors, and these are feather-stitched together with embroidery silk. Some work patterns in outline on the plain colors. These quilts are very handsome, and with care should last through several generations. Very pretty imitations of eider down comfortables are made of soft wadding covered with some pretty shade of satteen or silesia, pale pink, blue, gray, or cardinal. They have five or six rows of quilting all around, about an inch apart, and stripes of quilting two or three inches apart through the center. Patchwork quilts of cotton, if made at all now, are usually of two colors only, dark and light. The old-fashioned comfortables, piles of which we used to see in our grandmother's closets, have given place to blankets, which are much more desirable, as they can be washed.

Bureau and washstand covers are among the most common pieces of fancy work, and are of countless designs. Among the prettiest, this winter, are those of crash or momie cloth, made in scarf pattern, with the ends in embroidery and drawn work, from a quarter to half a yard broad. They may be done with colored silk, but are much prettier when worked with the threads which have been taken from the material. The fringe, which is formed by drawing out threads, when the work is all done, has a broad heading made by alternately taking out and leaving seven or eight threads; and, over those left, working a cross-stitch or feather-stitch. Above this are broad, open patterns of drawn-work, and ribbon may be drawn through, or a bright color placed under. There should be a pin cushion cover to match. Mantel and window lambrequins are made in the same way, or they may be crocheted with fisherman's twine to imitate the Macramé work, which is so much more difficult. Any pretty pattern of knitted or crocheted edging can be used, and a fringe added, or colored tassels of chenille on each point.

Table linen, in a full, good supply of which a good housekeeper takes pride, is varied and beautiful enough to satisfy any taste. There are table cloths and napkins suited to every occasion, and every course from soup to coffee and fruit, with appropriate designs in colored or white embroidery; but an initial or monogram, worked in white, with or without fringed sides, which can be washed without fear of losing color, seems most desirable. Damask cloths of red or grayish brown are pretty and economical for breakfast and tea. The latest imported styles for napkins are long and narrow,

like towels. These napkins protect the dress very perfectly, and are to be welcomed for this reason.

The large stores in the cities bring out their gingham, prints and muslins in early spring, and it is well to make up plain summer dresses now. Styles which are simplest and can be done up easily are chosen for such goods. Plain blouse waists, plaited or gathered into a belt, a plain overskirt looped high on the hips, with an underskirt tucked or trimmed with gathered flounces, always laundry well.—For children a blouse waist, and skirt of two or three scant ruffles, with a broad sash of the material tied behind, is very pretty.

It is best to make up under-clothing early, if done at home. If one wishes a combination of corset-cover, skirt and chemise, which is popular and desirable, a close-fitting polonaise pattern, with the back seams cut off to an ordinary basque length, and two plain breadths gathered on and sewed into the long front side seams, will make a garment quite as satisfactory as those which cost two dollars and a half. ETHEL STONE.

Fashions in "Twine-Work," Lamp Shades and Flowers.

It is wonderful what a variety of articles may be manufactured out of twine. There was never a greater demand for the Macramé cord, although the real tied Macramé seems to have had its day. The crocheted work is so much easier and quicker that most ladies prefer it, especially as it is almost as handsome as the knotted. One of the prettiest designs is a dainty little work-basket, either round or oval, starched, and formed over a tin pan. When quite dry and stiff it is covered with liquid gilding: a slip of card-board the exact size of the bottom, is covered with blue satin and fitted in, with a puffing of the same satin around the top. This makes a charming little article for a gift, or to sell at a fair. We have seen whisk-broom holders, work-bags, boxes, catch-alls, and bracket lambrequins, all crocheted of this cord, and heard it suggested that it would make excellent table-mats.

A simple and pretty design for a lamp-shade may be made of natural ferns, if they are gathered while young and pressed between blotting-paper. Six rounded sections, the proper length, square at the top, and graduating toward the lower part are cut out of glossy white paper, lined with pale pink silk, and pinked out in scallops around the edge. On these the ferns are arranged fastened with fine green sewing silk, and the lining caught to each section by a little fancy stitch. The top of the shade consists of two hexagons, made of card-boards covered with the pink silk, and edged with lace, between which the sections are fixed in. A round opening is cut in the top, to fit over the chimney, and care should be taken to have this large enough to prevent scorching. This shade can also be made very effective in spatter-work, on white Swiss muslin. Wild flowers are preferred now for decoration, or for corsage bouquets. Young ladies frequently discard the conventional roses and violets, for the simple yellow and white marguerite, buttercups, and above all the red clover blossoms, which fickle fashion has decreed shall be the popular flower of the season.

Holder for Newspapers.

A very simple, easily made holder for newspapers, is here illustrated. It may be placed on the wall

at any available point, and if desired, at a height to allow one sitting or standing to glance over or read the paper. Cut a strip of canvas a yard long, and two inches wide. Work in a cross-stitch pattern, line with calico, and bind each edge with ribbon. Sew a ring upon each end to slip over nails, and cover the rings with neat ribbon bows,

Pretty and Inexpensive Curtains.

A pretty and somewhat new way of using cheese cloth, or bunting, for bedroom curtains, is the following. For lining or foundation use Turkey red, or blue, or pink chintz. First make a straight lambrequin of the foundation material, and over this gather a similar one of the cheese-cloth or bunting. The latter may be tacked to the lining before hanging it. Gather it so as to leave a narrow heading. Edge both the lambrequin and curtains with inexpensive lace. Line the bands for looping back the curtains with the same color as the foundation, or use ribbon to match. If you have a plaster cast, three feet high or so, prepare a curtain of a yard of crimson canton flannel, by sewing on one end the small brass rings sold for this purpose. [Felt costs but little more, and holds its color much longer; velvet is still better, but it is more expensive]. A small, round wooden rod, stained or painted black, and varnished, is run through the rings, and fastened across the corner of the room. This forms a fine back-ground for the image. Its length should be such as to just touch the floor, and reach a little above the image.

N. H. C.

A Cupboard Front.

House-keepers are frequently troubled by dust settling upon table-ware standing on the dresser. To obviate this, we have had a door fixed to ours, which not only acts as a protection to the dishes, when closed, but makes a temporary rest or table when open. It is secured by a chain on each side, of the proper length to hold it on a level with the dresser. It turns on hinges, and gives the cupboard a desk-like appearance, and makes it look

A CUPBOARD WITH DOOR.

neater than the ordinary open cupboard. It is not at all difficult to construct one, using good pine, either stained and varnished, or painted, to correspond with the body of the cupboard.

Simple Hints for Busy Fingers.

Many an old lady, and young one too, finds no other evening employment so pleasant as knitting, which requires little thought or eyesight. For such fireside work, a pretty piece of fancy work is a cover for a sofa cushion, knit of narrow silk strips. The foundation is of common cotton yarn, knit on medium-sized needles. Knit three rows, then draw through each loop on the next row a bit of silk, cut in strips of equal length and width. Arrange the colors according to fancy. The yarn must be drawn very firmly down, to keep the silk in place. Old ribbons and silk remnants work in as well as new.

The matting that comes round tea chests is good for a great variety of fancy purposes. One of the nicest is a newspaper case. When handsomely made, these bring a high price in New York. A

square of the required size is cut out, on which a beautiful design is painted in oil colors, or else embroidered in crewels. A larger piece of matting forms the back, and they are joined together by triangular pieces of silk, five inches wide at the top, narrowing off to nothing, and all is bound with narrow ribbon the same color as the sides, or else trimmed round with quilled satin ribbon.

Salt and sugar jars, and common clay flower-pots, are now ornamented in a very artistic manner, simply with flowers made of putty. These are molded in the hand, fastened on the pot, and then tinted. For a first attempt, choose some single flower, as a daisy or wild rose; but there is no limit to which this art can not be carried, and with care in selecting and applying, these jars will last as well as those fired.

So-called "Limoges ware" is now made by painting the vases with oil colors and covering with a kind of varnish, which takes the place of burning.

A new freak of fashion for the china closet, particularly if one has old, handsome china, is to display it behind a half-drawn curtain. A novel and inexpensive one can be made of a partially worn bed-spread. Soak it in water colored with coffee, to give it a rich, creamy tint, and edge with a band of Turkey red. Then carefully cut out of cretonne, flowers and sprays of bright colors, with their foliage and buds. Arrange these for an inside border, and buttonhole them round with embroidery silk, working the stems in outline sketch. It makes a beautiful curtain, quite ornamental in a dining-room, hung with brass rings on an oak rod.

Kindlings in Paper Bags, etc.

Having for more than a generation been on the constant outlook for little as well as large devices that will in the slightest degree add to human convenience or comfort, and having continually asked our readers to write us of anything they practice or observe of the kind not likely to be known by all others, it sometimes seems as if the whole catalogue must be exhausted. Yet there are doubtless scores and hundreds of things that have not come to universal knowledge, and we reiterate the oft-repeated request for contributions in this line from all readers, even on matters so simple as the following. Calling by chance at the humble but pleasant cottage of a co-worker of by-gone years, the writer was welcomed to the "Prophets' Chamber," which we almost feared to enter on a cold night, after many chilling experiences in "spare-rooms." In this plainly but neatly furnished chamber is a small but ample stove, a box of pine wood behind it, a few hardy plants by the window on an easily moved support; half a dozen inconspicuous but strong hooks or pins, very convenient for hanging up one's clothing on when retiring, and so on.

But the new thing to the writer was found inside the wood-box. The paper bags brought from the grocers had been preserved, and some of these, holding one to two quarts, were filled with shavings, bits of wood and chips, and the open ends twisted together, or tied with a bit of thread. So on this cold morning it was only necessary to spring out of bed, place one of these filled bags in the stove, throw in a few sticks of wood, touch a match to the end of the bag, and back to bed again—all done in less than a minute. In quick time a warm room was ready for dressing in entire comfort. A dark enameled kettle on the stove, found ready filled, soon changed the temperature of the half frozen water in piteher and wash basin. Before leaving said room, we wrote this item, partly in gratitude, but more for the benefit of tidy housekeepers, who desire a convenient mode of keeping kindlings in a chamber, or elsewhere, without the usual litter.

A NICE BREAKFAST DISH.—Let raw potatoes, sliced as thin as possible, stand in cold water for an hour and a half. Put them in a pan with a large lump of butter, some pepper and salt, a little flour, but not enough to make them sticky, and fill the pan half full of fresh milk. Bake slowly in a stove oven for two hours, or until done.

Home-Made Toilet Table.

A very substantial, convenient toilette table, similar to the sketch, can be made at home with little outlay of time and money, by any one having any knack at using a saw, hammer, gimblet and

Fig. 1.—THE BOX.

screw-driver. It may be more or less tasteful, according to the skill of the worker and the covering material used. Selecting a strong packing box (fig. 1) of a convenient size, strengthen it with a few screws along each joining edge, and screw a strip on each side to support a shelf. Upon the back screw an inch-thick board firmly, of suitable height to support a mirror. Now cover with any available material of a color that suits the taste. Flowered chintz, a gray ground with pink roses over it, is very pretty and serviceable. A curtain around the front and two ends is securely tacked along the upper edge. A piece, the exact size of the top, is edged around with a ruffle two inches wide, and stretched over and tacked so that it hangs just below the edge. The mirror is held firmly by screwing it to the upright piece at the top and bottom. The mirror should be as tall as possible. If the money to be expended is limited, use most of it on the glass and have a plainer frame. A carpenter

Fig. 2.—THE STAND COMPLETED.

will make a good-sized pine frame for a trifle, which can be stained to look like walnut thus: Give the wood two coats of a solution of about half an ounce of permanganate of potash to a quart of water. In a few minutes wash off with water, dry, and varnish.—A mat of white linen worked with bright colored thread is laid on the top so that the fringed ends hang over the front. Before the mirror, place the pin cushion, worked to correspond with the mat.

MRS. BUSYHAND.

Out of the Waters.

BY AGNES CARR.

"Charlie, what's a moggage?" asked little Nancy Linn, as she and her brother picked their way over the mile of muddy roadway between the stone schoolhouse and their rather isolated little home, on the picturesque bank of a broad river.—"I dunno; some animal I reckon," and Charlie shied a stone into a big puddle at the path side.—"I don't believe it's 'xactly an animal," said thoughtful little Nancy slowly, and then dropping her voice mysteriously, "I think it must be a giant or a dragon."—"Ah! mebbe it is," assented Charlie, pleased at the romantic idea, a dragon with a fiery mouth, "for pa said, if 'twas'nt for the moggage we could have a new roof on the house; and the fairy book dragons swallowed horses and cows, and sometimes buildings."—"And when I asked

mortgage."—"Oh! ma, will you see it?" asked Nancy, with a frightened face.—"What dear?"—"The moggage."—"Yes, I expect I shall, and thank Heaven, we have the money to pay this half, though it has been hard work. But you'll be quite safe with Stumps in the house, and we'll be back by noon to-morrow."

An hour later, the old yellow stage drove up to the door, and Charlie and Nancy waved farewell to their parents, feeling quite important at being considered big enough to keep house.—"Be sure and lock the door to-night, and don't set anything on fire," called back papa.—"And don't run outdoors, for it rains again," said mamma, as she donned her waterproof, and the shouts, "Yes, we'll be very careful, good bye, good bye!" The little couple watched the coach out of sight, and then sat down by the kitchen fire to think what they should have for supper.—But when the twilight shadows gathered and a heavy rain poured down,

Nancy looked sober, and was sure the parlor carpet would be spoiled; and at last both became frightened, as the water dashed in more wildly.

"We must go upstairs," said Charlie.—"But let us take something to eat," said Nancy, "for you don't know when we can get down again." So wading to the cupboard they packed a basket with bread, meat and milk, and then, followed closely by Stumps, made their way with some difficulty up to the floor above, as the rising water already covered the second step.—"Dear me! what would pa and ma say if they could see us now," sobbed Nancy.—"We must sit up all night and watch the house," said Charlie; "but don't cry, Nancy, the water won't come up here, for it has stopped raining, and somebody will come to-morrow to take us out. Let's play Robinson Crusoe, and pretend we are cast away on a desert island, and Stumps can be our man Friday.—But Nancy would not be comforted, and at last sobbed herself to sleep with her

A FLOOD THAT BROUGHT AN UNEXPECTED BLESSING.

Drawn and Engraved for the American Agriculturist.

ma to buy me a silk dress, like Kittie Allen's, she sighed and said, 'No, dear, not while the moggage exists.' It must be a horrid creature not to let a little girl have even a nice frock."—"I wish I could eat him in pieces, and drown him," cried Charlie, now quite excited, "and now's a good time, for see how high the river is." Sure enough the mighty stream, swelled by heavy spring rains, and the melting snow on the hills above, was rushing turbulently along, filled with floating ice cakes, crashing against each other.—But now "Stumps," the ugliest looking dog alive, with only an inch of tail, and a pair of torn and battered ears, but the children's dearest friend and playmate, came bounding to meet them, and diverted their attention.

On entering the house they found mother preparing for a journey, and their father counting a pile of bank bills on the old pine table.—"We are going to leave you alone to-night," said Mrs. Linn, "for your father wants me to go up the road with him to Squire Fielding's, to pay the interest on the

it seemed a little lonely, though the bright fire and comical old Stumps tried their best to make it cheerful. When the tea-things were put away Charlie and Nancy returned to the mysterious "moggage," wondering why it made their mother so sad, and their father's face wear such a worried, careworn look whenever it was mentioned.—"How the river roars to-night?" said Nancy, about eight o'clock.—"And see! what is that!" exclaimed Charlie, pointing to a tiny stream stealing under the door, and trickling across the floor. "The river must be rising!" He rushed to the window, but the dense darkness obscured everything.—Before long the whole floor became wet, and the children curled their feet on the chair rungs, while Stumps sniffed uneasily, as if he thought something was wrong. The water kept on, creeping, creeping up; and coal scuttles, brooms and baskets began to swim round comically. Charlie thought it was "jolly fun," and taking off shoes and stockings paddled round after the various articles; but

arms around Stumps' neck, with her brown curly head pillowed on his rough coat.—Charlie tried to keep awake, but finally threw himself on his little bed, and slept soundly until the morning sun came streaming in.—All things seem brighter by daylight, and Nancy awoke quite her happy self again, though both children were startled when they looked out of the window. They were, indeed, literally surrounded by water, which was up to the top of the front door, and covered the garden fences, while the angry stream seemed carrying all things before it. Trees torn up by the roots, dead bodies of horses, cows, and sheep, barrels of potatoes and turnips, chairs and tables, all went sailing by, being whirled along, or caught between cakes of floating ice. "Oh! see that poor little piggy!" cried Nancy.—"And how funny those red apples look, bobbing about," said Charlie; and running for his fish-pole, tried to drag some of the things towards him.—"But they were horror stricken when in the outer channel, where there

was less ice, a small house went by, with an old woman and a child screaming from an upper window, and though they had escaped themselves they were powerless to help these unfortunates.

Stumps, meanwhile, was in a great state of excitement, pricking up his dilapidated ears, wagging his scrap of a tail, and occasionally making sudden dashes out into the water, returning with a drowned chicken, or a soaked cabbage in his mouth; for he was a fine swimmer, and in summer spent almost as much time in the river as on land.

They were very glad of Nancy's bread and meat, and had just eaten it, when a curious object caught their eyes.—"It's a cradle," said Charlie.—"And oh! there is something in it!" exclaimed Nancy. "I see it move. Oh! can't we save it! here, Stumps, Stumps, catch it, old boy!"—In a moment the dog was by her side, and with a short bark as though he understood, plunged into the seething water, and swam toward the little ark floating perilously near some crushing ice blocks. He reaches it, and clutches one rocker with his teeth, but cannot draw it along, and casts heseeching glances toward the window, from his honest brown eyes.—"I must help him," cried Charlie.—"Oh! no, no, don't go," pleaded Nancy; but as a faint wail of a child reaches their ears, Charlie steps upon the window ledge and springs upon a huge cake of ice that has lodged against a tree, near the house. It cracks ominously under his weight, but does not give way; and running lightly and swiftly to the extreme edge of the ice floe, and heading far over, he manages to seize and drag toward him the frail cradle boat, in which he sees snugly nestled a fair blue-eyed baby, with tears on its cheeks and its rose-hud mouth drawn up in such a pitiful way it goes straight to his heart.—There's no time to lose, for already wide gaps appear in the ice behind him; and springing to his feet, he catches up the tiny bed, and makes a rush for life back to the window where stands Nancy shivering with fear.—She holds out her arms and grasps the cradle, baby and all, just as the ice parts, and down goes poor Charlie, and disappears under it. With a scream Nancy dropped on the floor, and it would have gone very hard with Charlie if faithful old Stumps had not been right at hand. In an instant he was after him, dragged him into clear water, and swam gallantly toward the window, where, though chilled through, Charlie was able to scramble in, to be received with a warm embrace from Nancy, who declared "he was the bravest boy, and Stumps the very dearest dog in the whole world;" adding, "but do hurry and change your clothes, or you'll catch your death cold.—He hastened to do so, and soon returned in his Sunday suit. "Just see, the sweet little baby you have saved," said Nancy, who was holding it in her lap by the bedroom fire—which fortunately had not gone out—and feeding it with warm milk. The little thing drank eagerly, laughing and cooing so prettily the children were charmed, and at last it went to sleep, cuddled up in a warm blanket, and watched over by Stumps, who licked the soft white cheek and seemed to consider the wee stranger his especial property.

"I hope we can keep him always," said Nancy, while Charlie, feeling none the worse for his sudden bath, examined the cradle, which was daintily furnished with snowy linen and a soft silken coverlet, and discovered a square tin box hidden under the mattress.—"Somebody has packed away their treasures here," he thought, lifting the lid but found nothing but bundles of papers tied up with red tape. "Pshaw! I wonder what they wanted to save these dusty old things for."

So the day wore away, but the children were quite happy with their new plaything; for the water baby laughed and played, and seemed quite contented. And towards evening, when little "Moses"—as Nancy named him because he came out of the river—had gone once more to slumberland, they heard voices without, and a boat was rowed up to the window, and their papa and mamma, with anxious faces, entered hurriedly, and clasped their boy and girl in their arms. "Oh! I have imagined you drowned, or frozen, or carried away to the sea, all day," cried Mrs. Linn.—"I

hope the poor Squire will be as happy in finding his little one," said her husband, returning to the boat, and helping out a gray-haired man who looked the "picture of despair." "Come in, Mr. Fielding, and rest awhile, before continuing your search. You see," he explained to the children, "Squire Fielding's house is even nearer the river than our's; and while he and his wife were engaged moving out some things, the cradle in which

THE CHIMPANZEE AND HIS PET.

his baby was sleeping was washed out of the door by a sudden wave, and went floating off down the raging stream, nobody knows where."

"Did it have a blue silk quilt?" asked Charlie, excitedly.—"Yes, yes," exclaimed Mr. Fielding, "have you seen it pass here, was it safe?"—Before Charlie could reply Nancy brought the infant from the corner and placed it in its father's arms, who, overcome with joy, could scarcely speak a word.—Then the story of the rescue was told, and Charlie and Stumps were so overwhelmed with compliments it was hard to tell which was the happier or prouder of the two.—"I offered a thousand dollars to whoever saved my child, and you and your dog have fully earned it," said Mr. Fielding.—"Oh! no," replied Charlie, "Pa won't let me take money for a little thing like that!" At which Mr. Linn nodded approvingly.—"Then I must reward you in some other way. Did you find a box in the cradle?"—"Yes, sir. Here it is, safe and sound." Opening it, Squire Fielding selected a paper which he placed in Charlie's hands, saying, "Give that to your father, and tell him his son has cancelled it forever."—Not understanding, the boy handed the document to Mr. Linn, who exclaimed with joy, "It is the mortgage, wife! and our home is our own again! Oh! what a weight this lifts from my shoulders!" while Nancy whispered, "Mamma, is the dear baby's father the 'dreadful mortgage'?"—"No darling, he is a good, kind man, the mortgage is dead, and will never trouble us again."

So the big freshet did some good after all! and though Nancy was sorry to part from the blue-eyed baby, and the parlor carpet was spoiled, Mr. Linn always says, "Thanks to Charlie and Stumps, the great spring flood washed our farm clear of all debt, and left us the happiest, most independent family in the whole country side."

The Chimpanzee.

The monkey cage at a menagerie, and the Simia (Monkey family) house in the zoological gardens, are always surrounded by crowds. All of the monkey family bear more or less resemblance, if not in appearance, at least in their ways, to those of human beings, and spectators seem to never tire of watching them. A small section of this family

comprises the Gorilla, the Orang-outang, and the Chimpanzee, animals that are nearer man in size and also in their appearance than the other monkeys. Yet the skeletons of these differ in a great number of important points from that of man, and those naturalists who claim that there is a relationship between these and men fail to prove that it is a close one. Looking at the portrait of the Chimpanzee here given, you will probably not care to claim it as that of a very near relative.—The Chimpanzee is a native of Western Africa, and as it does not endure a change of climate very well, it is seldom seen in this country. It differs from the other two above-named in not living in trees. When standing upright it is from three to five feet tall, and has very long arms. It is covered with black hairs on the body, with some gray ones on the face. None of these naturally walk erect, and in walking they do not set the palm of the hand on the ground, as do other monkeys, but the knuckles, hence this group is called "knuckle-walkers;" they also touch

the ground with the outer edge of the foot. The accounts formerly given of these apes that they arm themselves with sticks and stones, go in large bands to attack the villages of the natives, and capture and carry off women and children, have been found by later travelers to be only traditions. They feed entirely upon vegetables and only molest the natives by stealing their rice and other crops. It is said that the Chimpanzee is one of the few animals that makes use of an implement; it uses a stone when it has a hard nut to crack. When captured young the animal is very lively and playful, but as they grow older in captivity they often become sullen and very ferocious.

A CLUSTER OF GEMS NOT USUALLY DISCOVERED IN THIS HIDDEN FORM.

The Doctor's Talks.

IS SPONGE A VEGETABLE OR AN ANIMAL?

A young correspondent, in sending some questions about sponge includes the one given above, which has frequently puzzled much older persons.

At one time naturalists regarded it as a plant, but at present it ranks as an animal, or rather it is

a few drops of oil of cloves are added, and it is preserved in a closely-covered jar or wide-mouthed bottle to prevent drying. For ordinary mucilage procure at a drug store some cheap gum Arabic, pick out all the sticks and other foreign matter, and placing it in a bottle, add rather more water than enough to cover it and cork the bottle well; let it stand where it can be turned upside down

good qualities of flour paste and none of the bad ones of mucilage made of gum Arabic.

ABOUT THE WEED LISTS.

When in September last I asked for lists of weeds, I supposed that I might have as many as fifty or possibly a hundred. To my great surprise, I find that I have five hundred and eighteen! These vary from lists of a dozen or two, all the way up to those containing a hundred and fifty plants. Though I specified weeds of the farm and garden, a number have regarded every wild plant as a weed. In lists of this kind only those names of plants troublesome to cultivation will count. To examine this immense pile of letters, and count and compare the lists require an amount of labor that I have not yet found time to give. I hope to get through with it in time to announce the decision in the back part of this number. If I do not, it will appear in the next. THE DOCTOR.

Among the Wolves.

Naturalists are not agreed as to our Gray Wolf, some claiming that it is a variety of the wolf of Europe, while others consider it as distinct. They are sufficiently alike in character and disposition to make each in its country despised and dreaded. Many suppose the European wolf was the original of the dog, and there are curs enough with wolfish character to make the parentage seem probable. From being bold and wonderfully daring in pursuit of its prey, when once entrapped it becomes the most abject coward. It is stated that a poor woman fell into a pitfall-trap, and a wolf which had previously been caught was so completely cowed at finding itself a prisoner that it lay quietly all night, making no attempt to injure the woman. In its build the European wolf is lighter than the American, with longer legs and ears. Its color is gray, with a tinge of fawn-color; with many black hairs. In Siberia and other high latitudes it becomes almost white. The wolf in the engraving has evidently been on a foraging expedition, and looks pleased at the prospect of a hearty meal. The Prairie Wolf or Coyote is much smaller than the Gray Wolf; it is abundant on the Western plains, and makes hideous noises at night.

FISHING FOR SPONGES.—Engraved for the American Agriculturist.

a collection of animals. The material we call sponge is only the framework of the mass. This, when the sponge is alive, is covered on the outside by a slimy or jelly-like substance which lines the cavities also, and is the living part of the sponge. It is made up of numerous individuals belonging to the lowest order of animals. The sponge shows few signs of life beyond keeping up a current of water, which passes in by some of its numerous small openings and is forced out through others.

WHERE DO SPONGES COME FROM?

There are a great number of different kinds of sponges besides those of the shops, and some are to be found in nearly every sea, though they have so little resemblance to what you ordinarily see that you would hardly suppose them to be related. The finer kinds come from the Levant and Mediterranean, while the coarser sorts are from the West Indies and Florida. The Turks gather them by diving, while the sponge-fishers of the islands along the coast of Greece use a kind of fork fixed to the end of a pole, as seen in the engraving. Those collected with the fork are apt to be injured. Besides, the finest kinds are found in water fifty feet or more deep and can only be reached by diving. To prepare the sponges they are covered with sand when the jelly-like portion soon decays; after this is removed they are thoroughly washed and dried. The finest quality of sponge is very costly. It is sold by weight, and the dealers at Smyrna, the principal market, understand how to make it hold a great deal of very fine sand. Indeed, when a case is opened and the sponges are beaten, the sand often far outweighs the sponges.

MUCILAGE AND PASTE.

"B. R. R.," Baltimore Co., Md., wishing to "connect loose papers," and "make a smooth job," asks "if there is anything better than the mucilage sold by stationers. If not, what mucilage is the best."—The ordinary mucilage is a solution of cheap gum Arabic in water, with a very little carbolic acid, oil of cloves, or something else added to prevent mould. If mucilage is used to join two pieces of paper, it becomes hard and stiff when dry, and is not near so good for this purpose as common flour paste, or better still a paste made with rice flour. Such paste will keep a long time if

and not fall over. Invert the bottle daily or oftener, and the gum will soon dissolve. If in a hurry for the mucilage the gum will dissolve much sooner in a small sauce-pan set on a warm part of the stove and frequently stirred. A mucilage for general use that I like better than that from gum Arabic, is made from dextrine, from which much of that now sold as mucilage is manufactured. This is starch that has been so altered by treating it

THE WOLF (*Canis lupus*).—Engraved for the American Agriculturist.

with weak acid that it will dissolve in cold water. It may be used like gum, to form a mucilage of the desired thickness, with either cold or hot water. This keeps well in a bottle or jar, and has all the

It is fond of the domesticated dog, and will follow an emigrant train which has a dog, for many miles over the prairie. It is said that at nightfall the Coyote and the dog will frequently play together.

OUR RECORD OF

Recent Agricultural Inventions.

Plow.—Henry O. Roop, Carrolton, Ga., Nov. 20; 288,666.—This invention consists essentially in a plow point carrying two independent wings, which may be fastened together and to the plow standard by a single

bolt. These wings form the mould-board of the plow, or when desired they may be adjusted to convert the plow into a scraper; or the wings may be fixed so that one will act as a scraper and the other as a land turner.

Automatic Gate.—William Thornton and Alfred Ferris, Elkhart, Ind. Nov. 13; No. 288,601.—This gate is hung by the supporting rod, *C*, and the rope, *E*, running over the pulley, *D*, and carrying the weight, *F*. When it is desired to open the gate, the latch is raised, the falling weight causes the gate to slide back, and by the action of the pivoted rod, *C*, and the arrangement of the uprights, *BB*, the gate is swung around at right angles to its first position, so as to leave the space it previously closed free for the passage of any vehicle. The

advantages claimed for this gate are its simple construction, its easy operation, and the absence of all complicated mechanism that would be liable to get out of order.

Potato Planter.—H. D. Herrington, Hoosic, N. Y. Nov. 13; No. 288,237.—Mr. Herrington's aim is to improve the class of potato planters employing a hopper from which potatoes are delivered to a platform and thence dropped into a spout, which delivers them into a furrow behind a furrow opener, there to be covered by a

follower. The improvements claimed lie in the mechanism for operating the valves in the potato holder and the spout, and the combination of these parts with the plat-

form. The mechanism is operated by gearing connected with the traction wheels. The figure shows a front elevation of the operating portion of the potato planter.

Dirt Scraper.—D. A. Faulkner, Sacramento, Cal. Dec. 18; No. 290,410. The frame, mounted on wheels and runners, supports a peculiarly hung scraper, which, by means of the lever *h*, can be raised and turned to a vertical position for dumping. The engraving shows the scraper bowl raised, and the means by which it is thrown into and out of position for working. When *h* is upright, the notch in the upper edge of the bowl rests between the curved prongs *k*; the arms *i*, lie nearly parallel with the bottom of the bowl, the rear links *f*, are nearly horizontal, and the front links *e*, are inclined rearwardly to their joints *e*. In this position the strain

against the bit is in a line directly against the rear links *f*, and the bowl cannot be forced back. The amount of the load is regulated by means of the stops *j*, and the bolts *g*. The mechanism is simple, easily adjusted and operated, strong, and not liable to get out of order.

Cultivator.—John M. Blade, Alpha, Ill. Nov. 20; No. 288,764.—This invention relates to the class of machines known as parallel or tongueless cultivators, and

consists in the manner of connecting the plow beams to the beam-yoke, and the runners to the same yoke; the aim being to form a cheap, strong and effective connection between parts where there is great strain, while at the same time the coupling permits of all the movements common in this class of cultivators. The figure shows a side elevation of the cultivator.

Combined Harrow and Cultivator.—L. A. John, Dunlap, Kansas. Dec. 4; No. 289,659. The construction of this machine is clearly shown in the engraving. It is made of iron bars, bolted so as to be readily taken apart for transportation. The long

teeth at the front may be set low down to the bottom of the furrow in cultivating listed corn. The plow standards are hung so as to swing freely on pivots, and thus may be brought close together or held wide apart, as the nature of the crop may require. The claims cover the frame of angular bars connected by the arched bar in front, and a cross bar in the rear, both being detachable; also the construction, connection and bracing of the draft-clevis and harrow-beams, and the mode of hanging the cultivators in the combination also.

Plow.—Frank Chevalier, Lexington, Ky. Nov. 20; No. 288,776.—In this plow the mould-board is divided into prongs and fusers, to adapt it for use in sticky soil, and

for digging potatoes. A special feature of the plow is the brace which supports the mould-board at its outer edge, and forms a means of attachment for one of the handles. The advantages claimed for this plow are in its simple construction, lightness, cheapness and adaptability to the uses named.

Check-Row Dropper.—J. H. Warren, Burlington Junction, Missouri. Dec. 25; No. 290,950. The principal claims of this patent lie in connection with the roller *a*, and the guide-bar *d*. The pivoted lever *c*, has at one end a pin *h*, which projects in the cam-slot *a*, of

the roller. The other end is connected with the dropping slide of the planter. The bearing of the pin in the cam-slot as the roller turns, gives to *c* the desired rocking motion. The bar *d*, carrying the guide-pulley *e*, is pivoted centrally, and by means of the spring-arm *d*, is made capable of the oscillating motion desirable in check-rowing machines, on account of the uneven feeding along the wire, due to the roughness of the ground.

Butter Tub.—H. F. Coombs, Charlottetown, Prince Edward Island, Canada. Dec. 4; No. 289,390. By using staves thin at the top, and thick at the bottom, Mr. Coombs makes a butter tub of the conventional shape outside, yet widest at the top inside. The hoops

cannot slip off in transportation, and when the tub is to be emptied, the butter can be turned out in bulk; also, the hoops can be loosened, and the cover or top removed without turning the tub over. It would seem to be well suited for holding butter for distant shipment.

Cultivator.—N. H. Williams, Joliet, Ill. Nov. 18; No. 288,289.—The special feature of this invention lies in the mechanism by which the plow of a cultivator may be turned so as to throw the furrow in either direction,

at the will of the operator. The figure represents a longitudinal section of a cultivator, showing a side elevation of the rocking head and its connections, by means of which the plow is deflected to either side.

Seed-Drilling Harrow.—A. M. Knell, Elliott City, Md. Dec. 18; No. 290,244. A harrow for drilling in clover or grass seed, especially when harrowing grain. The engraving shows a harrow with the improvements applied; also the interior construction of the hoppers and teeth. The drill-teeth are channelled for the passage of the seed; at the top of each is the hopper c,

with a cut-off valve and a handle connected with the bar x, which is surmounted by a hand-lever g, by which the valves of all the drill-teeth are operated. The claims cover the construction and operation of the hopper as applied, and also with modifications which enable the improved teeth to be applied to an ordinary harrow.

Harvester.—J. F. Seiberling, Akron, Ohio. Dec. 18; No. 290,431. The engraving is a side elevation of the drive wheel and frame from the stubble-side of the machine, showing the principal parts in which improvement is claimed, that is, the means for adjusting the frame and platform upon the drive-wheel, whereby the adjustment of both wheels may be made simultaneously. The improvements consist primarily in securing toothed segment brackets upon opposite sides of the drive wheel,

and on its axle, which is provided with toothed gears for engaging the brackets, also in securing to the end of the axle a drum, upon which one end of a chain is wound, the chain having connections with the platform and the grain wheel, whereby the adjustment of the drive-wheel axle effects the adjustment of the grain-wheel upon its frame supports. Improvements are also claimed in the construction of the grain-wheel support, and in the means for adjusting it.

Cultivator.—B. K. Nichols, Lower Lake, Cal. Nov. 27; No. 289,127. This invention applies to two-wheeled cultivators, and is intended to improve the apparatus for raising and lowering the teeth, and the means for keeping the machine level, preventing its burying itself behind, helping to hold it on a hill-side, and otherwise facilitating the operation of the machine.

The figure shows a cross-section of the machine. The improvements claimed lie in the swivel trail-wheel, G, which is pivoted to the cultivator-bed in front of the drag-bars, and directly in rear of the axle, and in the shape and connections of the frame-bars, drag-bars and rock-shaft. The advantages gained by the invention are thought to make this machine particularly available for the cultivation of vineyards and similar places.

Corn Planter and Marker.—M. M. Clough, Carlisle, Iowa. Dec. 18; No. 290,320. This machine drops the corn simultaneously in two parallel rows, at regular intervals of time and space, and at the same time marks the ground for equidistant and parallel rows, and also check rows. The improvements claimed consist: 1st. In the manner of forming a rigid carriage (with wheels at the rear end and runners in front), by means of metal sections that serve as axle bearers, together with an adjustable caster-wheel to lift the runners as required in turning and starting rows evenly. 2nd. In the manner of forming and applying the markers. 3rd. In the manner of combining and adjusting the heels of

pivoted runners with the seed-boxes to regulate the depth of furrows. 4th. In combining a land roller with the carriage to smooth the ground and keep the runners in the soil at a uniform depth. The engraving shows the machine with the several improvements as applied.

Harrow.—C. A. Brostrom, Rock Island, Ill. Dec. 18; No. 290,525. The inventor aims to improve the construction of harrows with pivotal teeth, so as to do away with wooden tooth-beams, and at the same time make a strong, light and durable harrow, requiring no staples or similar devices for holding the teeth. The engraving shows two sections of the harrow, with enlarged portions of tooth and tooth-beam, showing their construction. The beams are of angle-iron, with slots and holes for the

teeth, the upper end of which is bent at right-angles to the body. By attaching the teeth as shown, the teeth have a certain play in the slots, and are less liable to break under strain, than when fastened to the bottom of the beam. By reversing the draught the harrow can be used either as a sharp or as a smooth barrow, as desired.

Dough or Butter Worker.—W. H. Bryan, Warm Springs, Va. Dec. 18; No. 290,392. Intended to secure greater cleanliness, and to avoid the heat of the hands in working butter or dough. The levers or

beaters are intended to be used with a chopping motion, alternately, and shifted at the same time from side to side, so as to act on all the material to be worked over. The simple construction of the dough or butter worker is sufficiently shown by the engraving given above.

Corn Planter.—R. M. Clark, McPherson, Kansas. Nov. 27; No. 289,222. Mr. Clark's aim has been to improve the general details of the construction of corn

planters, and the combination of the parts, so as to produce a simple, easily operated, durable and not expensive machine. The figure shows the general character of the machine; an extended description of all the working parts would be necessary to give an idea of the improvements claimed.

Plow.—W. W. Speer, Pittsburgh, Pa. Dec. 25; No. 290,714. The plow beam is provided with two holes for the bolts, c, c, by which the standard is attached and adjusted. The standard is of metal, U-shaped in front ele-

vation, and are-shaped in side elevation. It is bent at the foot to any shape required for attaching the point. The arms of the standard embrace the beam and are attached as shown. The only patentable novelty lies in the use of two curved slots, by means of which the standard can be easily adjusted without removing the bolts, and finally locked against strains without bracing.

Farm Gate.—H. J. Elliott, North Manchester, Ind. Dec. 18; No. 290,554. Mr. Elliott's object is to provide a cheap, simple and durable gate, which may be raised to avoid snow or ice, and to prevent dragging

on the ground, and to provide it with an improved latch, calculated to keep animals from opening the gate. The means employed, as shown in the engraving, are obviously simple, and apparently efficient and durable. The gate locks top and bottom, the latch, f, and an extension of the lower bar engaging slots in the collars marked a. The weighted arm e, helps to lift the gate.

Plow.—G. N. Dexter, Jr., Madison, Georgia. Dec. 25; No. 290,669. The engraving shows the plow as seen from the front and furrow side, the mould-board being removed. The improvement claimed lies in the form of

the standard. It has a cutting edge below the beam, and passes up through a slot in the beam, to which it is pivoted; then curves backward into a bow-brace, the rear end being secured to the beam by an adjustable bolt. This construction gives a light, strong plow of few parts.

Wisely adopted by Dairymen.

The adoption by most of the prominent dairy men and farmers of the United States, of the Improved Butter Color made by Wells, Richardson & Co., Burlington, Vt., is a proof of their wisdom in a business point of view. Nearly all winter butter is colored in order to make it marketable, and this color is the best, in regard to purity, strength, permanence and perfection of tint.

ONE TRIAL OF CHILDREN'S SHOES with the

\$500.00 IN PREMIUMS

Offered for the Largest Yields of
PRINGLE'S NEW CEREALS, From One-Quarter Acre of Ground.

PRINGLE'S AMERICAN TRIUMPH OATS.

The average height, as the grain stands in the field, is six feet, yet the straw is so strong and firm that it holds up well, without lodging. The tall, luxuriant heads filled with plump, heavy grains. The quality and productiveness of the grain are unexcelled, yielding from 50 to 100 bushels per acre, according to the condition and state of fertility of the land.

PRINGLE'S ADAMANT SPRING WHEAT.

In this beardless variety we have one of the hardest and most flinty varieties in cultivation, very productive, hardy, and vigorous. Straw yellowish-white, very stiff and erect, averaging 4 feet in height. For cultivation in Northwest, Colorado, and the Pacific coast, where hard wheat is the favorite sort, we are confident that this will be particularly desirable.

PRINGLE'S GREEN MOUNTAIN SPRING WHEAT.

This is another beardless variety of great promise. The straw averages about 4 feet, light yellow, very strong, and free from rust. Heads average 4 to 5 inches in length, somewhat tapering; kernels white, large, and plump. Very hardy and productive.

PRINGLE'S INVINCIBLE SPRING WHEAT.

This is a beardless variety of remarkably robust and vigorous growth; the straw is strong, stiff, well glazed, healthy, and stands up well in all kinds of weather. The heads are four to five inches long, very compact, and uncommonly well filled; berry of light amber color, plump, hard, and very heavy. It is wonderfully prolific; a bushel will easily produce fifty to seventy bushels, if properly cultivated.

Price of each of the above varieties: By mail, \$1.00 per lb.; 3 lbs., \$2.50; 2 oz. trial packets, 25 cts. each, post-paid. By express, at purchaser's expense, per peck, \$4; bush, \$12.

Every one can compete. No restrictions, except the seed must be bought of us this spring. Descriptive circulars, with full particulars, mailed free on application.

B. K. BLISS & SONS,
34 Barclay St., New-York.

Pea, Bliss' Abundance.—90 pods counted on a single plant. Very productive, 15 to 18 inches high. Second early. Excellent quality. 25 cents per packet; 5 packets, \$1.00.

Pea, Bliss' Ever-bearing.—A perpetual bearer, yielding a full crop until frost; an excellent late variety, 18 to 24 inches high. Peas 1 1/2 inches in circumference. Immensely productive. 25c. per packet; 5 packets \$1.00.

Pea, Bliss' American Wonder.—The best and earliest variety grown. Very dwarf, excellent flavor. 20 cents per packet, 40 cents per pint, 75 cents per quart, post-paid.

N. B.—These three varieties will give you Peas the entire season until frost. Require no brushing.

American Champion Watermelon.—The best eating and best shipping melon grown. More productive than any other sort. 25 cts. per pkt., 5 pkts. \$1.00. **Cauliflower, Sea Foam.**—The best early variety, sure to head. 50 cts. per packet.

Rhubarb, Early Paragon.—A new English variety. The earliest and most productive. **Never runs to seed.**—Roots only for sale, 75 cts. each, post-paid. **Pansy, Bliss' Perfection.**—The choicest strain yet produced. Our *Gardeners' Hand-book*, for 1884, contains a beautifully colored plate of this magnificent variety. 50 cts. per packet of 50 seeds. **Carnation, Shakespearean.**—The finest ever introduced. Continue in flower the whole season. 50 cts. per pkt. Plants, 50 cts. each. \$1.00 for the set of 9 varieties. **Wild Garden Seeds.**—A mixture of 100 varieties of Flower Seeds. A packet will plant a square rod of ground. 25 cts. per pkt., 5 pkts. \$1.00. For other Novelties see Bliss' Illustrated Novelty List, which describes the newest and choicest Flowers, Vegetables, Fruits, Cereals, Plants, etc., in full.

BLISS' ILLUSTRATED HAND-BOOK FOR THE FARM AND GARDEN. 150 pages. Beautiful Colored Plate, 300 Illustrations. Invaluable to all interested in gardening or farming. Mailed for 6 cts.

B. K. BLISS & SONS, 34 Barclay St., New York.

LANDRETH'S CENTENNIAL SEED CATALOGUE "GARDENERS' COMPANION."

PRICE 10 CENTS. The most complete and brilliantly embellished Seed Catalogue ever published, costing fifteen cents. The article on *Market Gardening under Glass* is worth twenty times the price. This being **OUR ONE HUNDREDTH YEAR**, we publish this **Ornate Guide for Garden and Farm.** To all sending us **TEN CENTS** in stamps, we mail a copy, and on orders for Seed will give credit for that amount. Address

LANDRETH & SONS, Seed Growers, Lock Box, Phila., Pa.

Alley's Early Deep Head Cabbage.

Every one, who has raised that magnificent cabbage, the Fottler or Brunswick, has regretted that so fine a cabbage did not make a thicker head. The Alley Early Deep Head is the successful result of years of careful selection and high cultivation, to obviate these defects. As early as Fottler, it is as large, is thicker and heavier bulk for bulk, and brings more in market than any other drumhead. **PER PACKAGE, 25 CTS.; PER OZ., 75 CTS.** Early Eta Apes Cabbage (new) earliest of all, 10 cts. per package. Guerande Carrot, (new) remarkably thick at the neck, per packet, 10 cts.; per oz., 30 cts. Perennial Onion (new) lives in the ground without protection all winter, and is ready for use weeks earlier than any other kind, per pkt., 15 cts.; per quart, 80 cts. Solid Ivory Celery, (new) nearly self-blanching, per pkt., 15 cts. White Boniuel Cucumber (new), a mammoth white variety of extraordinary diameter, per packet, 15 cts.; Dwarf Green Early Lettuce (new) from France, per packet, 15 cts.; Banana Melon (new), it resembles in color and form a huge banana, and has strikingly the same fragrance; per packet, 15 cts.; Kentucky Wonder Pole Bean. I have not found in 60 varieties one so prolific; a capital string bean; per packet, 15 cts. Marblehead Early Horticultural, probably the earliest of all beans, and yet a true horticultural! per packet, 15 cts.; per quart, 80 cts. Marblehead Early Sweet Corn. The earliest of all, giving growers a complete monopoly of the early market; original stock, per packet 10 cts.; per quart, 60 cts. Sea Foam Cauliflower, decidedly the finest variety of all; per packet, 50 cts. To those taking the entire collection, I will present a copy of either one of my four books, on the raising of Onions, Cabbages, Squashes, Mangold Wurtzels and Carrots, the purchaser to make the selection.

I offer **\$1,000.00 in Premiums**, for Vegetables raised from my Seed. **SENT FREE TO ALL.**

FLOWER SEED. I offer one packet each, of choice mixed selections, from the following varieties, for 40 cts. the retail price of which would be 80 cts.: Astors, Balsams, Nasturtiums, Drummond Phlox, Salpiglossis, Sweet Pea, Dahlia, Holzbock, Petunias, Abronia, Umbellata (very beautiful).

JAMES H. GREGORY, Marblehead, Mass.

300 BEAUTIFUL ILLUSTRATIONS 150 pages, and a **Beautiful Colored Plate of Flowers**, tells WHAT, WHEN, and HOW to plant, and is full of information invaluable to all interested in gardening. MAILED FOR THREE TWO-CENT STAMPS, to cover postage.

Bliss's Illustrated Potato Catalogue.—Contains a list of 500 varieties of Potatoes, embracing several new and very promising varieties with explicit directions for culture, and much other valuable information respecting this indispensable esculent. 10 cents.

THE AMERICAN GARDEN.

A beautifully illustrated Monthly devoted exclusively to the Garden. **Valuable Premiums given to each Subscriber.** \$1.00 per year, 3 months trial trip, 30 cts. Sample copy and Premium List free. Do., with Colored Plate, 10 cts.

Purchasers ordering seeds to the value of Five Dollars in one order, will be entitled to a copy of the *American Garden* for one year. **B. K. BLISS & SONS, 34 Barclay St., N. Y.**

TRY DREER'S GARDEN SEEDS

which have been planted by some growers for 45 years. The quality is the first consideration secured by the most careful selection. The prices, the lowest consistent with sterling merit. **Dreer's Garden Calendar for 1884**, offering Vegetable, Flower and Field Seeds, Plants, Bulbs, everything for the garden, mailed Free. **HENRY A. DREER, 714 Chestnut Street, PHILADELPHIA.**

VICK'S FLORAL GUIDE

For 1884 is an Elegant Book of 150 Pages, Two Colored Plates of **FLOWERS** and **Vegetables**, and more than 1000 Illustrations of the choicest Flowers, Plants and **VEGETABLES**, and Directions for Growing. It is handsome enough for the Center Table or **Holiday Present**. Send on your name and Postoffice address, with 10 cents, and we will send you a copy, post-paid. This is not a quarter of its cost! It is printed in both English and German. If you afterwards order seeds deduct the 10 cents. **VICK'S SEEDS ARE THE BEST IN THE WORLD.** The *FLORAL GUIDE* will tell how to get and grow them.

VICK'S Illustrated Monthly Magazine, 32 Pages, a Colored Plate in every number and many fine Engravings. Price \$1.25 a year; Five Copies for \$5. Specimen numbers sent for 10 cents; 3 trial copies 25 cts.

Address,
JAMES VICK,
Rochester, N. Y.

SEED CORN

DOUBLE your CROP by PLANTING CAREFULLY SELECTED & TESTED SEED of the Best Varieties.

The **IMPROVED LEAMING** is the earliest yellow Dent in cultivation, ripening in 90 to 100 days from time of planting. Ripened perfectly in Northern States the past two seasons when all other varieties failed. Ears large and handsome, deep grain of dark orange color, small red cob; stalks of medium height, producing two good ears, husks and shells easily adapted to all kinds of soil. **136 bushels** shelled corn have been grown to the acre. It far surpasses all other varieties in earliness, productiveness, and fine quality. See our Catalogue for testimonials, etc. Packet 10c., lb. 50c., 3 lbs. \$1.00, postpaid by mail; quart 25c., peck 90c., bushel \$2.75, bag (2 bushels) \$5, ten bushels \$22.50. **Chester Co. Mammoth, Farmer's Favorite, Golden Dent**, extra selected, lb. 40c., 3 lbs. \$1.10, postpaid; peck 75c., bushel \$2.50, 2 bushels \$4.50, 10 bushels \$20. **White Surprise**, Pride of the North, Cloud's Early Dent, each per packet 10c., lb. 40c., 3 lbs. \$1.00, postpaid; peck 90c., bushel \$2.75, bag (2 bushels) \$5. **ORDER NOW, and GET OUR NEW AND COMPLETE ILLUSTRATED CATALOGUE**, in which we offer **\$665.00 IN CASH PRIZES FOR** what we offer **1884 MAILED FREE.**

SEED CORN.
Early Clinton County Yellow. Well-matured. All will
grow. Yields well. Last year raised on 30 acres 2,900 bush-
els. Price, \$1.50 per bushel. Also, pure blood Jersey Red
Pigs and Jersey Cattle, both thorough-breds and grades for
sale by R. A. CALVERT, Portsmouth, Ohio.

BURPEE'S MAMMOTH IRON-CLAD WATER-MELON.

As the introducers of the now celebrated Cuban Queen, we
now bring before the public, for the first time, an entirely distinct
and most valuable Water-Melon. Burpee's Mammoth Iron-Clad
has such decided points of superiority that it will speedily
become a popular favorite with all lovers of fine Melons, while
for market it is *unequaled*. The shape is the most perfect;
skin handsomely striped; seeds drab-white. The flesh is particu-
larly beautiful, of a dainty red, and more crystalline than in
any other Melon. Of most delicious, rich, sugary flavor, the
heart is very large, and the flesh next to the rind is fully equal
to the heart in luscious taste. The flesh is never mealy, but
always firm, *remarkably solid*. Burpee's Mammoth Iron-Clad
grows *uniformly* to a larger size than any other variety known.
Under ordinary cultivation we have had hundreds of Melons
weighing from 60 to 70 lbs. each, and the entire crop averaged
50 lbs. Very vigorous growth, matures early, and is the most
productive variety known. The Melons are true *Iron-Clad*,
and have frequently been dropped from the shoulder of a man,
without bursting. The bardness and tenacity is in the outside
coating or enameling of the skin. Without exception, Burpee's Mammoth Iron-Clad is the best variety for shipping and keeping.

25 cts. per pkt.; 5 pkts. for \$1.00. Each purchaser is entitled to compete for \$100.00 in CASH PRIZES for 1884.
BURPEE'S GOLDEN-HEART LETTUCE—Entirely new; most attractive, mammoth, firm heads; delicately curled
leaves; beautiful golden-yellow heart, and remanish of superb quality for weeks under hottest weather. Pkt., 25 cts.; 5 pkts., \$1.00.
A REMARKABLE OFFER! In order to induce thousands of new customers to give our Seeds a fair trial (knowing, from experience, that they then become regular customers), we make the following liberal
offer for 1884:—On receipt of only 50 Cents, in Postage-Stamps, we will send one packet each of the two rare novelties above-
named, alone worth the price, and also one packet each of Burpee's Netted Gem Musk-Melon, sweet as honey, and a
gem indeed; Burpee's Imp. Blood Turnip Beet, best; Etampes Cabbage, earliest; Burpee's Sunchest Cabbage,
all head and always sure to head; Yellow Danvers Onion; New Red Rozen Onion, immense size, mild; Spanish
Monstrous Pepper, large, sweet, red; Hollow Crown Parsnip, improved; Perfect Gem Squash, prolific and excellent;
Early Long Scarlet Radish, quick growth; Burpee's Improved Long Orange Carrot, best; Purple Top Munich
Turnip, earliest and handsome, and Livingston New Favorite Tomato. The above 15 Packets are worth.
Retail Value, \$1.50; but we will send the Entire Collection, by Mail, to any address, for ONLY 50 CENTS, or Five
Collections for \$2.00.

FOR ONE DOLLAR We will send above Splendid Collection of 15 Varieties, and ALSO One Packet each of the following:
Ultra Sweet Corn, sweetest of all; New Telegraph Peas, immense pods, full of large, luscious Peas; Peerless
White Spine Cucumber, none better; Imperial Dwarf Large Ribbed Celery, the best; Burpee's Superior
Large Flat Dutch Cabbage, the standard; New No. 2 Cabbage, splendid second-early; Veitch's Autumn Giant
Cauliflower; Perpetual Lettuce, fine; Large Red Wethersfield Onion; New Giant Yellow Rozen Onion,
of most striking beauty, enormous size, and pleasant flavor; Golden Globe Radish, unsurpassed for summer; Salsify, long
white; Spinach, new, thick-leaved, round, and Burpee's Climax Tomato, justly so celebrated.
The 30 VARIETIES, new and choicest Seeds, as named above, amount to \$2.75 ACTUAL VALUE; but we will
mail the entire Collection for ONLY ONE DOLLAR. This is certainly the greatest offer ever made by any reliable
Seedsmen. All full-size packets, with illustrations and full directions for culture printed on each. We are ORIGINATORS
and not imitators of this plan of placing a valuable Collection of the best Garden Seeds before the public at less than half usual
prices. BURPEE'S SEEDS are warranted first-class in every respect, few equal, none better, and we are determined
to prove their superiority to all who will try them.

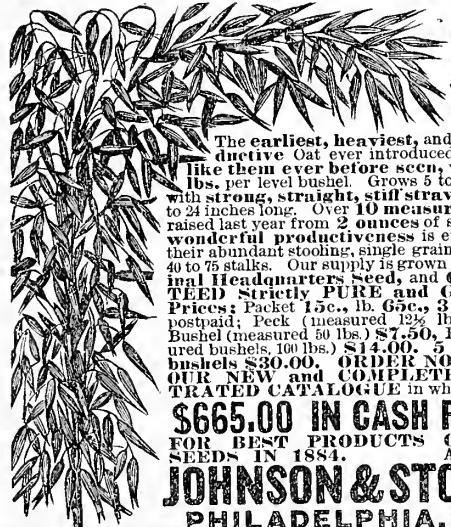

\$1000.00 IN CASH PRIZES FOR 1884, to the Growers of the best Vegetables and Farm Products from
Burpee's Seeds. Competition open to all. See our Catalogue for particulars. Show this advertisement to
your friends and get them to send with you. 3 Complete Dollar Collections (in all 90 packages of Seeds,) mailed for \$2.50. Entire satisfaction guaranteed to every purchaser.

BURPEE'S GEM COLLECTION of Asters, Balsams, Pansy, Petunia, Phlox,
FLOWER-SEEDS Verbena, Double Zinnia—in all TEN PACKETS—most beautiful varieties, with full
directions for culture, for only 25 cts., or 20 Packets Choicest and most Popular Varieties, worth \$1.25, mailed for 50 cts.
The 20 Pkts. Flower-Seeds and the 50-Cent Vegetable Collection—in all 35 Packets—mailed for One Dollar—less than 3 cts. a Packet.
SPECIAL INDUCEMENT for readers of *The American Agriculturist*. If you ORDER EARLY, we will send free
a copy of BURPEE'S FARM ANNUAL for 1884, (price 10 cts.) 120 pages, hundreds of illustrations,
with 4 superb Colored Plates—the best and most complete Catalogue of the kind. BURPEE'S ABRIDGED CAT-
ALOGUE, with large illustrated circular of WELCOME OATS, mailed free to any address.

WELCOME OATS!

The earliest, heaviest, and most pro-
ductive Oat ever introduced. Nothing
like them ever before seen, weighing 50
lbs. per level bushel. Grains 5 to 8 feet high,
with strong, straight, stiff straw. Heads 20
to 24 inches long. Over 10 measured bushels
raised last year from 2 ounces of seed. Their
wonderful productiveness is explained by
their abundant stooling, single grains producing
40 to 75 stalks. Our supply is grown from Original
Headquarters seed, and GUARANTEED
SEED STRICTLY PURE and GENUINE.
Prices: Packet 15c., lb. 65c., 3 lbs. \$1.75
postpaid; Peck (measured 12½ lbs.) \$2.25,
Bushel (measured 50 lbs.) \$7.50, Bag (2 measured
bushels, 100 lbs.) \$14.00. 5 measured
bushels \$30.00. ORDER NOW, and get

CABBAGE
Try this brand of Seeds.
They are produced by years
of careful selection from the
very best strains of American
varieties, grown and seeded
on Puget Sound, which
has a climate and soil more
perfectly adapted to perfect-
ing the Cabbage than any
other in the world, and are grown by ourselves, so
that we know they are right. They are the
largest and plumpest seeds and produce the
thriftiest plants and finest heads of any
in the world. We can now supply True Early
Jersey Wakefield, Early Bleichfield, Fottler's Im-
proved Brunswick, Late American Drumhead and
Late Flat Dutch, all of this superior brand, at 5
cts. per packet, 25 cts. per ounce, \$4.00 per pound,
free by mail. Samples free. Try them! Send for

SIBLEY'S TESTED SEEDS

FOR ALL CLIMATES, FOR ALL SOILS, ALL PLANTS.

All tested for vitality, and in Gardens for purity and value.

AT LOWEST PRICES.

FOLLOWING ARE SOME OF OUR TESTED SPECIALTIES:

Sibley's Pride of the North Corn.—Ripened in all Northern sections in '82 and '83, ahead of all com-
pared varieties, in 90 to 100 days from planting. Yellow dent, 16 rowed, small cobs, very productive.
Yields 60 to 100 bushels per acre. THE SUREST TO RIPEN. Send for Catalogue.

Wauashakum Corn.—Yellow flint. The most strictly pedigree corn extant. Uniform, handsome, early.
Very heavy, 64 lbs. per bushel. Has yielded 123 bushels shelled corn per acre. Send for Catalogue.

Sibley's Imperial Barley.—Produced 900 lbs. from 1 of seed; at rate of 236 bushels per acre.

American Triumph Oat.—Has the largest, longest and cleanest straw we have seen; 6 ft. high, 1/4 inch
in diameter; with no sign of rust. Many yields of 100 bushels per acre are on record.

Welcome Oat.—Very prolific, with remarkably heavy grain, which keeps its white color when the straw
is discolored by rust. SEND FOR CATALOGUE.

Saskatchewan Spring Wheat.—Selected from the Fife; highly productive. Millers give it the highest
commendation. Send for Catalogue.

Dakota Red Potato.—Best of 125 varieties in Test Garden. FREE FROM ROT AND BLIGHT. Superior
quality. Yield 725 bushels per acre in ordinary cultivation. THE COMING MARKET POTATO.

Wall's Orange Potato.—One of the best new sorts; a great yielder; of fine quality. Send for Catalogue.

Mayflower Potato.—Early, excellent. Rural Blush, and all tested sorts. Send for Catalogue.

Pacey's Ray Grass.—Will make a fine thick sod, superior for grazing or lawn, in 30 days.

Sibley's First and Best Pea.—The first of all early market sorts. Crop ripens all together; highly
productive, of fine quality. THE VERY BEST FOR EARLY MARKET. Low Prices.

Choice Peas of all standard varieties, true, clean, free from weevil, at lowest prices. Send for Catalogue.

Early Etampes Cabbage.—Claimed to be the earliest of all varieties. Forms fine, solid heads, of
excellent quality. A fine market sort. Send for Catalogue.

Jersey Wakefield Cabbage, of the finest strain; also Winningstadt, Fottler's Brunswick, Excelsior
Flat Dutch, and many others; all remarkably pure and uniform, at lowest prices.

Early French Mammoth Asparagus.—The largest, earliest and finest yet introduced.

White Plume Celery.—Self bleaching; requires no banking; very beautiful; of fine flavor; solid.

Rochester Tomato.—The largest smooth tomato. The earliest large tomato. The most productive.
Does not rot; is solid, coreless and of unexcelled flavor.

Livingston's Favorite Tomato, Golden Trophy, and all tested sorts. SEND FOR CATALOGUE.

Extra Early Purple Top Munich Turnip.—The earliest of all varieties; of medium size, white flesh
fine flavor. No. 1 for market culture.

Floral Novelties.—Several scores of all the tested new varieties. A superb collection.

All the above and many more are described in our CATALOGUE AND PRICE LIST of
Vegetable, Flower and Field Seeds of All Tested Valuable Varieties; sent FREE on application.

Mail Orders promptly filled, thus making a great Seed Store at your own door.

Reduced Prices to Clubs.

BUY NORTHERN CROWN SEEDS.

Flowers, Vegetables and crops. Send for new Catalogue; contains everything for Garden, House and Farm. It will pay you to get it. Largest stock of pure Farm Seeds in the West. Beautiful Plants and Roses by the 100,000.

JOHN A. SALZER, La Crosse, Wis.

The accompanying picture gives a partial view of the Monmouth Nursery, where the largest and best stock of Strawberries, Raspberries, Blackberries, Gooseberries, Currants and Grapes in the Country is to be found; also, a superior stock of Fruit and Nut-Trees. All the Standard and New Varieties of value are grown. Among Small Fruits a specialty is made of the Hunsell Raspberry, Early Harvest Blackberry, and Jessica Grape—the earliest and most valuable varieties; and, among Trees, Kieffer's Hybrid and Le Conte Pears, Japan Giant Chestnut, and the new Peaches. Send for Lovett's Illustrated Catalogue, which tells the whole story,—varieties, prices, descriptions, giving the defects as well as the merits, truthful engravings, with instructions for growing Fruit-Trees and Plants. It is conceded by the press and public to be the most beautiful and useful Fruit Catalogue ever published. "So beautiful, and contains such sensible directions about Small Fruits that everybody should send and get one."—*Farm Journal*. "A gem of a Catalogue, gotten up with much care and artistic taste."—*Am. Garden*. "The best edited and best printed Catalogue in the country."—*Wine and Fruit Grower*. "The lists are well selected, the descriptions trustworthy."—*Rural New Yorker*. "Decidedly the handsomest, most sensible and instructive Catalogue we have yet seen."—*Texas Siftings*. A special feature of the Nursery is the careful manner in which Trees and Plants are dug and packed. The Catalogue telling all about it, giving the experience of patrons in different parts of the country, mailed free, without colored plates or with them, for Four Cents.

Address, **J. T. LOVETT, Little Silver, New Jersey.**

CHOICE EL PASO ONION SEED.

50c. PER OUNCE; \$7 PER POUND.

Address, **W. A. IRVIN & CO., Druggists, El Paso, Texas.**

STRAWBERRY PLANTS and **RASPBERRY** Legal Tender, Jas. Vick, Big Bob, J. Queen, Manchester, Orient; all the best new and old kinds. Early Prolific, Re- lance and all new and best Raspberries, Kieffer and Le Conte Pears. Seions in quantity at low figures. Currants, Grape-vines, Trees, &c. Send for list. **J. C. GIBSON, Woodbury, N. J.**

FOR \$1,

I will send one package each of Beets, Wax Bean, Lima Bean, Early and Late Corn, Early and Late Cabbage, Cauliflower, Celery, Cucumber, Carrot, Kale, Lettuce, Musk and Watermelon, Onion, Parsley, Parsnip, Early and Late Peas, Pumpkin, Pepper, Radish, Squash, White and Yellow Turnip, Tomato, or two packages of any kind when one is not wanted. These seeds are true to name, fresh and reliable, and the same that I use on my own ground. Send order in early, to **S. A. SCRANTON, Gardener, Madison, Conn.**

EXTRA ONION SEED.

Extra because raised from only the very choicest onions, selected from a crop which took the first premium in this famous onion growing county. Catalogue free to all. **JAMES J. H. GREGORY, Marblehead, Mass.**

SEED POTATOES—STRAWBERRY PLANTS.—TWE- N- ty varieties of the best of the new Potatoes. All the new varieties of Strawberry Plants. Prices low. **E. BURKOUGH, MERCHANTVILLE, N. J.**

SEED-POTATOES and SEEDS.

60 newest varieties of potatoes. Garden seeds. Seed Grain, etc., at low- est prices. Illustrated catalogue and treatise on Potato Culture, free. **J. W. WILSON, Austin, Ill.**

Small Fruit Plants.

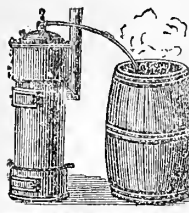

E. P. ROE Proposes to sell out his large stock of Small Fruit Plants at very reasonable rates, including perhaps the greatest number of fine currant bushes in the country. Statements of interest to the fruit-growing public will also be made. Catalogue sent free. Address, **E. P. ROE, Cornwall-on-Hudson, N. Y.**

SMALL FRUIT PLANTS,

GRAPE VINES, FRUIT TREES, &c. A superior stock of all the leading varieties, both new and old, at reasonable rates. Catalogues Free. Address **IRVING ALLEN, Springfield, Mass.**

Great Northern and Southern Nurseries.

Catalogues gratis, showing how and what to plant with much valuable information. For Spring of 1884, 300,000 No. 1 Peach trees, all the new and old Standard varieties. 100,000 Apple trees largely of the new long keeping varieties. Kieffer and Leconte Pear, with a full line of Nursery Stock at low prices. **RANDOLPH PETERS, Wilmington, Delaware.**

FERTILIZERS.
\$75 Premium.

\$50 to the farmer raising the largest crop of potatoes this year upon one-half acre manured with SARDY'S FERTILIZERS. \$25 for the second largest.

416 1-2 bushels good potatoes raised on one-half acre in 1883 by Alfred Rose, Penn Yan, N. Y., with SARDY'S PHOSPHO-PERUVIAN GUANO, adapted to all crops.

Standard Guaranteed. Prices Reasonable.
Send for Pamphlet,
J. B. SARDY & SON, 141 Water St., N. Y.

Stockbridge Manures.

PRICES REDUCED. STANDARD MAINTAINED.

The Massachusetts Fertilizer Inspector's Valuation of STOCKBRIDGE MANURES for the past seven years

Average \$4.45 per Bag.

The Average Price for 1884 will be \$4.50 per bag, or \$5 a ton less than last year.

In buying a fertilizer, its quality and by whom manufactured should be considered along with the price per ton. A ton of good English hay is considered by most farmers cheaper at \$20 than a ton of bog meadow hay at \$10; and for the same reason the Stockbridge Manures, which are made largely from chemicals, and are very concentrated, are cheaper at the prices asked than many fertilizers at half the price. They have stood the test of the field and State Inspectors for nearly ten years, and have been found the most reliable and richest fertilizers offered in the market. The fact that they have been well made in the past should be a sufficient guaranty of their strength and purity in the future; but, notwithstanding this, we are still under bonds to Prof. Stockbridge to maintain their standard. Send for pamphlet (mailed free), to

BOWKER FERTILIZER CO.,
43 Chatham St., Boston, Mass.

ECONOMICAL FARMING
MAKE YOUR FERTILIZERS AT HOME BY USING

POWELL'S PREPARED CHEMICALS

For \$12 You can buy a formula (520 lbs.) of POWELL'S PREPARED CHEMICALS. This when mixed at home makes a Ton of Superior Phosphate, equal in plant-life and as certain of successful crop production as many high-priced Phosphates. Write for pamphlet to **BROWN CHEMICAL CO. 16 Light St. Baltimore, Md.** EVERYTHING IN THE FERTILIZER LINE SOLD AT CLOSEST PRICES.

HOMESTEAD
SUPERPHOSPHATE,
A PURE BONE BLACK
FERTILIZER.

GOOD FOR ALL CROPS.

Price \$40 per ton. Sample bbl. of 200 lbs. sent on receipt of \$4.

An Unequal Fight.

Whoever engages in a contest with Uncle Sam is sure to come out second best, in the long run. Some parties concerned in lotteries in New Orleans, recently brought a suit against the Postmaster in that city. Finding that this official would not deliver their letters, they had them directed to the care of a Bank. The suit was brought to compel the delivery of all letters addressed to the Bank, without regard to whom that institution might transfer them. In the trial, some technical point was decided in favor of the lottery people. Forthwith it was telegraphed from one end of the country to the other, that Uncle Sam had been beaten in his own court. It is the worst victory the lottery chaps ever gained, as it only serves to indicate the weak points in the present law governing the use of the mails by lottery and other swindlers, and to show where amendment is needed. If they think that Uncle Sam will give up, just because a few skirmishers have been driven in, they do not know the old gentleman as represented by "Congress Assembled." The present Postmaster-General is known to be very much in earnest in excluding frauds from the mails, especially the lotteries, and will rigidly enforce whatever laws Congress may pass. The Senate Committee on "Post Offices and Post-Roads" are reported to be in favor of laws for restricting the use of the mails, much more stringent than those at present in force, and it is likely that lottery dealers will find more obstacles than ever. It is said that a law will be reported to exclude from the mails, not only the letters, etc., of lottery men, but to prevent the delivery of all newspapers containing advertisements of lotteries! That would be a severe blow, but when men undertake to fight Uncle Sam, they must expect to take as well as give hard knocks.

A Publisher Turns Banker.

A paper in Cincinnati proposes to set aside one-half its current receipts from subscriptions as a "Subscribers Loan Fund." As often as five thousand dollars accumulates it will be divided in loans of one hundred and five hundred dollars, among "selected subscribers," who by signing a note and paying four per cent. interest yearly in advance, can keep the amount as a perpetual loan. It is not stated how the subscribers who are to receive the loans are to be "selected," but it is consoling to be told "no subscriber is obliged to accept a loan."

After the Royal New Brunswick.

Those persecuted lottery people who fled from the tyranny of the laws of the United States, and left the genial climate of Kentucky and exiled themselves to bleak New Brunswick, are likely to fare no better with the British Lion than they did with the American Eagle. A correspondent informs us that a bill is to be introduced in the Dominion Parliament to enable the Post-office authorities to take possession of all correspondence addressed or mailed to or from the Royal New Brunswick Lottery office at St. Stephen, or any similar concern. "Alas, the tyranny of these 'effete monarchies.'"

A Galvanic Girdle.

Electricity, in its various forms, including galvanism, magnetism, etc., is so little understood that when great curative powers are claimed for various belts, garments, insoles and other appliances, including so-called "batteries," to be worn next to the skin, many are ready to believe them. As a rule these appliances make a great show of metals, but they are only for show; so far as we have seen them they can produce no current of electricity, being mere "closed circuits." The latest article of this kind is not a belt, but a "girdle," which is offered as "a positive and unfailing cure" for numerous diseases. This girdle, which is claimed to be "one of the greatest inventions of the present marvellous age," is thus described by a subscriber in Ohio, who says: "It is a cheap cloth strap, two and a half feet long and an inch and a quarter wide, with ten copper and zinc washers,

the size of a cent, attached: a mere toy concern, which could be manufactured for from three to five cents, and postage on the same is two cents."—The vendors of the girdle propose to send it on trial, on the receipt of forty-six cents postage, provided those who receive it will recommend it to their friends and neighbors.

Came to Grief at Last.

Several months ago the country was flooded with the circulars of Flemming & Merriam, of Chicago, who professed to have great facilities for speculating in grain and provisions, and asked for investments. We at the time advised our readers to let them alone. We did this on general principles, as their offers promised altogether too much. On January 14th last the members of this firm were convicted in the United States District Court of carrying on an extensive grain swindle, and each was sentenced to pay a fine of five hundred dollars and to twelve months' imprisonment in the county jail.

An Indignant Parent.

Is a prominent citizen of Red Rock, N. Y., who sends us circulars, that came addressed to one of his children, only twelve years of age. He says: "They are vile things, as you will see by examination."—These circulars refer to works which are either utterly useless, or absolutely pernicious, and ought never to be published. This, and other cases that frequently come to our knowledge, show how important it is that parents should know the character of the matter sent to their children by mail. The circulars to which we refer are issued by a concern that is able to give good business references, and their advertisements, the real character of which is concealed, are admitted into respectable journals.

A Gift on Payment of Express Charges.

Not long ago a well-dressed, plausible individual called at an educational institution not far from Philadelphia, and advised the officers thereof that a benevolent old lady was desirous of making the school a present. She had numerous valuable coins, various antiquities, and interesting relics, which she wished to bestow where they would be appreciated. These articles would be sent at once upon the payment of the express charges. The officers of the school for some reason did not accept the proposition, but it was afterwards learned that other parties had advanced the "express charges" to a large amount in the aggregate, and are still waiting for the valuable gifts from the benevolent old lady. This is an old dodge revived, and in the present cases worked as well as if it were new.

"Brahmo Yan, the Hindoo Deafness Cure."

Circulars claiming that a drug with the above oriental name "relieves deafness in twenty four hours and cures in from two to five weeks," and asserting that "it is a true specific for deafness as quinine is for malaria, but many times more certain in its effects," have been sent us for our opinion. Without reference to the value of the drug itself, the assertions in these circulars are likely to lead to much disappointment. They assume that deafness is a disease, while it may result from a variety of causes, and in many cases from the destruction of a portion of the hearing apparatus, is absolutely incurable. Before treating deafness one should ascertain its cause, and if, as often happens after scarlet fever and other severe diseases, the ear-drum is obliterated, all medication will be in vain. That any drug can be a "specific" in deafness is simply absurd.

A Fruit Tree Invigorator.

A correspondent in Livingston Co., N. Y., sends us a circular headed, "A Revolution in Fruit Culture," which is to be brought about by the use of "A Fruit Tree Invigorator." The compound is to be applied by boring a hole in the trunk of the tree, filling it with the "Invigorator," and closing the hole tight with grafting wax, or a cork. It is claimed for the compound that: "It so changes the flavor of the sap in the leaves and bark, that the aphids, that infest the tree, are unable to subsist on the leaves, and are therefore driven off, leaving the tree unmolested to bring forth its blossom and mature its fruit." Our correspondent asks us, if this "method of applying a fertilizer to fruit trees is a new discovery."

The claim that trees can be medicated by introducing substances into their trunks, is an old one; that it ever had any useful application we doubt. If a wound is made in a tree, an effort will be made to heal it. If a

foreign substance is introduced, it will in time be covered up by a growth of wood. That any useful results can follow the introduction of an "invigorator," or any other substance, into a trunk of a tree, we have no proof. It is as unnatural a method of feeding a tree, as it would be to attempt to nourish a man by the introduction of food into his leg.

The End of E. P. Tiffany & Co.

The above-named firm, in Fulton Street, New York City, had for a long time been advertising fire-arms, watches, jewelry, and various other articles, to be sold at exceedingly low prices, and orders were sent from all parts of the country by mail. The Superintendent of Police received many letters from country people, to the effect that Tiffany & Co. had swindled them out of small sums by not filling their orders, or by sending articles of little value. These complaints were so numerous that the Superintendent sent detectives to the store to make inquiry; they were informed that so many orders were received that it was impossible to fill them promptly, but that every one who had sent money would receive the articles ordered. Soon after, the Superintendent was informed that E. P. Tiffany & Co. had sold out their business to J. A. Smith, they stating that the back orders would amount to twenty-five hundred dollars, which he, Smith, assumed. An examination showed that Tiffany & Co. had received orders for about fifteen thousand dollars, had taken the money, and left the State. This caused Smith to make an assignment. The assignee says that the assets amount to between seven and eight hundred dollars, against which there is a preferred claim of six hundred dollars, and "the balance after deducting expenses, will be distributed pro rata."

According to the Superintendent nothing can be done on behalf of those who have sent money to the firm, unless they can institute a suit and obtain a warrant. Rather than do this, they had better pocket the loss.

Cautionary Signals.

Pernicious Books.

There is a whole class of literature, about which decent and educated people know nothing. These books need not be obscene (though they sometimes are), to be pernicious, but are useless, trashy stuff, that finds its readers among young boys, servants, and people ignorant enough to have dream books and such works. A chap in Brooklyn offers a book called "Gold and Silver, and How to Make It." We are told: "It is a new science, enabling every one to coin their own gold and silver." We hope its science is better than the grammar. The reader is thus advised to try it. "Give up that work which pays so little, for by this process you can coin more money in one day, than you could make in years at your work." Yet this wonderful book can be had for only ten cents, and what is more, if the purchaser is not satisfied, he can "trade back"—return the book and get his dime. Surely such trash as this should be excluded from the mails. Another, also in a neighboring city, has a long catalogue, which includes works of

CHOICE ROMANCE, FICTION AND ADVENTURE.

These, to judge from their titles, are the books which turn school boys into young ruffians and criminals. Among others are "The Peep O' Day Boys; or, Wild Life on the Mountains"; "Clerk Barton's Crime, or the Adventures of a Night," and more of like stripe. The same catalogue offers "The Book of Nature," the announcement of which states that the book "is not intended for promiscuous reading," and we might add, or for any other. "Love Making Secrets," is the title of another volume in this set of miserable trash.

Grass for a Name.—S. Liken, Liberty Co., Tex., sends us a specimen, and asks if it is not Bermuda-Grass. There are only stems and leaves, and one can not be sure about a grass unless it has flowers. Still upon comparing with specimens in our herbarium, we have little doubt that it is not Bermuda, but Buffalo-grass (*Buchloe dactyloides*). It has long, wiry, prostrate stems, a foot or more in length, which at intervals of a few inches, send up a tuft of leaves not more than six inches high. It spreads over the ground, and covers it with a dense mat of foliage, which is the principal food of the Buffalo. Mr. L. asks its agricultural value. That is a point which can decide, as it has not to our knowledge been tested. The fact that the foliage is so short, makes it doubtful if it can be cultivated for hay. Its value for pasture should be tested. Buffalo-grass is one of the few grasses that have staminate and pistillate flowers on different plants. In this, the two flowers are so strikingly unlike, that both forms have been described as distinct species.

"Agricultural" and Other Journals.— How they Get Subscribers.

For some time the advertisements of the "Household Magazine" have been conspicuous in the advertising pages of those papers, that would publish it. The advertisement called attention to itself by means of a heavy black border all around it, and by the use of large full-faced type within it. The object of this attractive advertisement seemed to be, not so much to set forth the merits of the magazine, as to proclaim the fact that every subscriber thereto was entitled to a "printed numbered receipt," which gave him a share in the "awarding of 'presents.'" The list of presents to be "awarded"—not prizes to be drawn—oh no!—made up a good share of the advertisement. These presents numbered one hundred thousand, and ranged in value from twenty-five cents all the way up to a "House and Lot in New York City," valued at \$15,000. These presents were to be "awarded" on a given date at "our Musical Festival and Word Contest," (whatever that contest might be.)

A GAME OF CHANCE

has an attraction for many people. If an offer of low and high prizes is made, there is a vast number of persons who are ready to "try their luck," hence it is not surprising that subscriptions to the "Household Magazine" were numerous. One morning, as a collection of girls were directing the Magazine to subscribers, and other girls were directing circulars by the thousand, certain parties walked in and carried off the Magazines ready for mailing, also the circulars, ditto the books. In short, all the "goods and chattels" of the "Household Magazine" were loaded upon three large carts and conveyed to "Police Headquarters." The publisher of said Magazine was taken to court, and required to give bail for his appearance on a given day to answer to the charge of

"CONTRIVING AND MAINTAINING A LOTTERY,"

and using the U. S. mails in a manner contrary to law. It is not likely that those who fixed their hopes on being "awarded" a house and lot in New York City, valued at \$15,000, will ever become holders of real estate in this way—indeed it is unlikely that subscribers to the "Household Magazine"—such as it was, will hereafter welcome its monthly visits. The publisher tried to run a "magazine" and a "lottery" at the same time, and these were too much for him. This method of running a journal or magazine with a lottery as an "annex," has met with a conspicuous failure in the case of the "Household," as that concern was supposed to be well "backed," and its lottery scheme concealed under "presents" and "awards" as skillfully as possible. The device of a

LOTTERY TO ATTRACT SUBSCRIBERS,

is now employed by several so-called agricultural journals, widely advertised in the Western States. These journals are largely made up of sensational stories, and by "appropriating" from the agricultural journals proper, a sufficient number of articles to give their sheet a rural aspect, the energies of the concerns are devoted to advertising them. The papers far and wide contain the advertisements of these quasi-Agricultural journals. One who has seen the advertisements of the "Household Magazine," must have noticed the remarkable similarity between these, and the advertisements of these

BOGUS AGRICULTURAL JOURNALS.

There is the same heavy black border surrounding both. The same full-faced black type, and especially the same offer of "presents," to be "awarded." These journals not only advertise widely in the daily and other papers in the West, but by a provision of the postal law, are allowed to send a "Sample copy" (often the only one published,) free. Observe that the chief point in these journals

IS THE LOTTERY.

They hold out the inducement that subscribers will draw—or be "awarded" a valuable prize or "present." The general desire to take a hand in a game of chance, must bring much money to the publishers. Those who believe that any such drawings or "awards" will ever take place, will in time find out their mistake. The law, as in the case of the "Household Magazine," will prevent the drawing of any such scheme, but in most of these so-called "agricultural" journals, the object is to hold out great inducements to subscribers, get their money, and let them wait for the results of the drawing or "award," as well as for the paper itself. This is a widely extended swindle, played upon the farming community, and the Post Office Department has it in its power to put a stop to it at once.

Microscopes for the Million.—See pages 142-143 for descriptions of the new *American Agriculturist* Microscope.

\$1,000 Reward.

Two years ago, the Publishers of the *American Agriculturist*, together with several other publishers, receiving and distributing their mails at our Station, were greatly annoyed by the disappearance of mail matter. The offender, a Post Office employee, is now serving a term in State Prison. During the past year there has been a re-currence of these exasperating mail robberies, and now another Post Office clerk has been arrested at this Station, and missing matter found in his possession.

A few days ago a gang of postal thieves was broken up in New England, and several of them arrested. A Connecticut dispatch states that some of the thieves have been robbing several of the mail routes and offices for years. For some time we have been endeavoring to ferret out these culprits, particularly when, on sending the paper to large clubs, one, two, three and four times over, the subscribers would fail to receive them. We now offer a **Reward of One Thousand Dollars** for the arrest, conviction, and punishment of all the parties guilty of robbing the mails of this office. We trust other Publishers who have suffered, will follow our example, until a sufficient sum has been subscribed by private parties, to make it a special object on the part of the United States Detectives, to overhaul mail robbers. Under the United States Postal Law he who steals newspapers is liable to conviction the same as if stealing letters.

Every one should be interested in this matter. Our admirable Postal Service, with its reduced rates, quick deliveries and vigilant watchfulness, is unquestionably superior to that of any other country. When we remember, however, that there are over forty thousand Post-offices and hundreds of thousands of miles of postal routes, every one can readily understand how necessary it is that all private citizens should do everything in their power to aid the authorities in arresting the offenders.

Furthermore, Congress should enact a new law this winter making the imprisonment and punishment for mail robberies still more rigorous. We ask our readers, in every State, to press this matter upon their Representatives at Washington, to the end that every postal thief, upon conviction, may receive such a summary punishment as to deter others.

What renders it all the more exasperating to the sufferer, is the fact that when an offender steals mail matter at any Post-office Station, or *en route*, he afterwards generally manages to steal the letters of complaint, so that cases are frequent where a party sends money, for example for a newspaper, and hears nothing from it. He writes and writes again and yet receives no response all this time. The thief who has taken the letter containing his money is stealing his subsequent communications. So far as the *American Agriculturist* is concerned, we believe that with the steps now in progress, neither publishers nor subscribers will experience further annoyance. The former request the latter to assist them in discovering and punishing any offender. Postmasters throughout the country, who, with scarcely an exception, are friends of the *American Agriculturist*, will gladly co-operate with our subscribers in the effort to bring such offenders to justice.

**The Dutchman's Pipe, and Purg-
ing Cassia.**—W. R. Gray, Jr., Fannin Co., Tex., having seen descriptions of these in November last, asks if they can be grown in Texas. The Dutchman's Pipe is hardy in New England and is kept at the leading nurseries. Purg-
ing Cassia is doubtful. The pods containing seeds are usually to be had at wholesale drug stores.

The Names of Fruits.—At the Meeting of the American Pomological Society, held at Philadelphia, last September, President Wilder in his address strongly protested against "long, unpronounceable, irrelevant, high-flown, bombastic names" for our fruits. By an unanimous vote, the Secretary was instructed to send to all kindred associations in the country a copy of the Society's rules on nomenclature, and a copy of the por-

tion of the President's address referring to the subject. This has been done in a neat circular, which we presume those interested may procure of the Secretary, Prof. W. I. Beal, Lansing, Mich.

The Migration of Birds.—It is a matter of common observation that certain birds appear in spring and take their flight southward in the fall. There are many circumstances influencing this migration, such as temperature, storms, the appearance of insects and others, that have not been investigated. The recently-founded "American Ornithologists Union" has appointed a committee on migration, which is to collect statistics on everything that relates to the coming and going of birds. The co-operation of "every observer of nature" is asked in aid of the work. Farmers are, or ought to be, close observers, and many will gladly aid in making the needed observations. All who wish to engage in the work, the results of which will be of much interest to farmers, can be furnished with circulars giving the points to be observed and full information as to the plan, by addressing C. Hart Merriam, Locust Grove, Lewis Co., N. Y.

Provide for your Families.

We cannot too often guard our many subscribers against being persuaded to take policies in Life Insurance Companies, whose standing and character are not well established. The fate of defunct companies here in New York and other similar rotten organizations ought to be a sufficient warning. At the same time people cannot be too thoughtful about providing for the future, by insuring their lives in reliable Companies, like the Mutual Life of New York, for example. The annual statement of this Company shows that the assets now amount to \$101,148,243.25. Its payments upon policies last year were nearly \$14,000,000, and its income nearly \$19,000,000. These figures tell the story.

FEARLESS.
The only machine that received an award on both Horse-power and Thresher and Cleaner, at the Centennial Exhibition; was awarded the two last **Cold Medals** given by the New York State Agricultural Society on Horse-powers and Threshers, and is the only Thresher selected from the vast number built in the United States, for illustration and description in "Appleton's Cyclopedia of Applied Mechanics," recently published, thus adopting it as the **standard** machine of this country. Catalogue sent free. Address **HINARD HARDER, Cobleskill, Schoharie Co., N. Y.**

THE "FIRE-FLY"
SINGLE WHEEL-HOE, CULTIVATOR, and PLOW.

IMPROVED MAMMOTH DENT CORN
Has from twenty to forty rows to each ear and will weigh sixty pounds to the bushel. It is the largest early field corn produced in America, and will ripen in from ninety to one hundred days. Some reasons why it is the best:
1. It will produce one-third more corn per acre with same cultivation and same kind of soil.
2. It has greater depth of kernel.
3. It has more rows than any known variety.
4. It ripens earlier than any field corn in America.
5. It stands the drought better than any other.
"In depth of grain and circumference of ear it far surpasses any corn we ever saw."—N. Y. Bee Journal.
Price by mail, postage paid by me 2 lbs. \$1.25; 4 lbs. \$2; 1 peck, by express, \$3.25; half bushel, \$3. No corn sent C. O. D. Send in your order at once.
Send stamp for circular, giving full description of the corn. Address, **HENRY DENBO, Corydon, Ind.** P. O. Box 268. Name this paper.

"ACME" PULVERIZING HARROW

AGENTS
WANTED.

It is the best selling
tool on earth.

CLOD CRUSHER
AND LEVELER.

The 'ACME' subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **double gangs of CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling off the ground and thoroughly pulverizing the soil are performed at the same time**. The **entire absence of Spikes or Spring Teeth** avoids pulling up rubbish. It is **especially adapted** to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface of the ground**.

We make a Variety of Sizes working from 4 to 15 Feet Wide.

DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL**. We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We **NEVER** ask for pay until you have tried it on your own farm.

SEND FOR PAMPHLET CONTAINING THOUSANDS OF TESTIMONIALS FROM 46 DIFFERENT STATES AND TERRITORIES.

BRANCH OFFICE: **HARRISBURG, PA NASH & BROTHER,** Manufacturing and Principal Office: **MILLINGTON, N. J.**

SEND

Now, if you are interested in Farming, Gardening or Trucking, for our **NEW CATALOGUE**, containing 32 pages and over 40 illustrations, describing fully the "**PLANET Jr.**" Horse Hoes, Cultivators, Seed-Drills, Wheel-Hoes, Potato-Diggers, Etc. Etc.

Champion Grain and Fertilizer Drill.

POSITIVE FORCE FEED DISTRIBUTORS.

SPECIAL DEVICE for planting corn for the crop.

FERTILIZER ATTACHMENT

Unequalled, and is warranted to distribute accurately, evenly and easily any commercial fertilizer—wet or dry.

Draft light and easily handled. Construction simple, Materials and workmanship the best.

We also make the **WHIPPLE SPRING TOOTH SULKY AND FLOATING HARROWS, CULTIVATORS, &c.**

These HARROWS are adapted for use on all kinds of soil, and are the best pulverizers known. No farmer can afford to be without one. Ample time given for trial before settlement. **BROADCAST GRAIN SEEDERS, with SULKY HARROWS, when desired.** Send for descriptive pamphlets to

GERE, TRUMAN, PLATT & CO., Owego, Tioga County, N. Y.

MATTHEWS' SEED DRILL

The Standard of America.

Admitted by leading Seedsmen and Market Gardeners everywhere to be the most perfect and reliable drill in use.

Also—
**MATTHEWS' HAND CULTIVATOR,
MATTHEWS' WHEEL HOE,
MATTHEWS' DRILL CULTIVATOR
AND HOE COMBINED.**

Comprising the best line of implements for planting and cultivating garden crops to be found in America. Send for circular showing latest improvements and latest prices. Made only by

T. B. EVERETT & CO.
(Successors to EVERETT & SMALL.) BOSTON, Mass.

THE ASPINWALL POTATO PLANTER.

Will plant 5 Acres per day. Marking, dropping, furrowing, and covering in a single operation. A fertilizer attachment can be furnished with a capacity of 600 to 800 lbs. per acre.

B. CILL & SON,
Trenton Agricultural Works, Trenton, N. J.

HENCH'S Riding or Walking Corn and Fallow CULTIVATOR.

With double Row Corn Planter and Fertilizer Attachments complete in one Machine.

RECEIVED MEDAL AND HIGHEST AWARDS OF MERIT AT THE GREAT SOUTHERN EXPOSITION, LOUISVILLE, KY., AND A NUMBER OF STATE FAIRS IN 1883.

THE KING OF THE CORN-FIELD.

Thousands in use giving entire satisfaction. The demand already this season is three times as large as last year.

RELIABLE AGENTS wanted in all unoccupied territory. Manufactured at York, Pa., and Orrville, Ohio. Send for catalogue mailed free. Address,

HENCH & DROMGOLD,

Name this paper.

York, Pa.

THE CHICAGO COMBINED PATENT

Flexible Harrow and Grain Cultivator.

All Teeth. Steel Best implement in use. Unequaled as a sod harrow and pulverizer. Works equally well in growing Wheat, Potatoes or young corn. Adds 5 to 10 bushels per acre to the yield. 25 to 60 acres per day cultivated by one team. Will pay for itself in one year. Send for Illustrated Price List. The Chicago Flexible Harrow Co., Sole Proprietors and Manufacturers, 35 to 41 Indiana St., Chicago, Ills.

The best improvement ever made in Hand Planters. They are warranted, and satisfaction guaranteed. Circulars and terms to Agents free. **WALLACE FISK,** South Byron, Genesee Co., N. Y.

DARNELL'S PATENT FURROWER & MARKER

Leaves the earth well pulverized at bottom of furrow. Marks any width from 2 1/2 to 5 feet, and from a mere mark to 6 inches deep.

"Take pleasure in recommending it. It does the business; is well made and will last for years." **J. S. Collins, Moorestown, N. J.**

"It far exceeds my expectations. If the real merits of this cheap implement were known to potato growers alone, the sales would be immense." **E. L. Cuy, Pres. Wash. Co. (N. Y.) Agr. Society**

M. W. DOUGHTEN Manufacturer, Moorestown, Burlington Co., N. J.

ONEONTA CLIPPER.

This Plow contains the most remarkable improvements ever made in swivel Plows. It is easy to handle, with **Shifting handles**, which enables the operator to walk with both feet in the furrow. The Hook or Latch is operated by the foot, so that the Plow is turned ready for use without taking the hands from the handles. Light to draw, firm, strong, and durable. Constructed of Patent Hard Metal, which is as strong and will scour equal to steel. We also make it of charcoal iron, at a less price. An Illustrated Catalogue of all our Tools and Implements sent free.

THE BELCHER & TAYLOR AGRICULTURAL TOOL CO., Chicopee Falls, Mass.

INCREASE THE CROP BY THOROUGHLY PULVERIZING THE SOIL.

Whipple Spring Tooth Sulky and Floating Harrows, Cultivators, &c., &c.

The teeth are arranged to cut and move the earth like so many small plows. Every inch of ground is moved and pulverized five inches deep if desired.

THE "WHIPPLE" HARROW is strong and well made; is adapted to smooth or rough land, and the teeth being independent, adjust themselves to rocky and uneven surfaces. These Harrows accomplish more with the same power than any other Harrow known, and can be used for a greater variety of work.

THE SULKY HARROWS can be adjusted for use as Riding or Walking Corn Cultivators, and when desired Broadcast Grain Seeders are furnished.

Ample time for trial allowed before settlement. Send for pamphlets describing our various styles of Harrows and Cultivators; also the Champion Grain and Fertilizer Drill.

GERE, TRUMAN, PLATT & CO.,
Owego, Tioga County, N. Y.

The Westinghouse

THRESHING MACHINES, Engines, Saw-Mills & Horse Powers.

Grain Threshers, unequaled in capacity for separating and cleaning.

Combined Grain and Clover Threshers, fully equal to regular grain machines on grain, and a genuine Clover Huller in addition.

Two Speed Traction and Plain Engines 6, 10, and 15 Horse Power, positively the most desirable for Lightness, Economy, Power and Safety. Boiler has horizontal tubes, and is therefore free from the objectionable features of vertical boilers.

Horse Powers, both Lever and Endless Chain. All sizes. Send for catalogue. Address

THE WESTINGHOUSE CO.,
Schenectady, N. Y.

HEEBNER'S PATENT

Level Tread Horse Power WITH SPEED REGULATOR.

Heebner's Improved Little Giant Threshing Machine.

No other Power is as powerful and easy for the horses. The Level Lags and Speed Regulator are the most valuable improvements ever made in horse powers. See that you get Heebner's, any other with level lags will be an infringement upon our patents.

The Little Giant has more good points than any other Thresher. None can do work as fast, nor any better, and none are better made. Union Feed Cutter, Drag and Circular Saws, etc. Send for Illustrated Catalogue.

HEEBNER & SONS, Lansdale, Pa.

The "Right Speedy" CORN SHELDER.

Cheap, Durable and Effective; shells 12 to 14 bushels per hour.

It is the best hand Sheller made and I warrant it for 5 years.

Price \$5, or handsomely nickel-plated, \$6.

AGENTS WANTED.

If no agent in your vicinity, I will send Sheller express paid, on receipt of price. Send for circular.

THE FERGUSON Bureau Creamery.

Shallow Setting PERFECTED.

Why is it Best?

SIX SOLID REASONS.

1. Because it separates the cream most completely, and therefore makes the most butter.
2. Because it keeps the milk at a uniform temperature of 60° and so secures the cream in the best possible condition, and therefore makes the best butter.
3. Because it favors the greatest development of color and flavor, and the best texture, or 'grain,' and therefore is the best for making fancy butter.
4. Because it keeps the milk in a pure, cool, dry air, and fully ripens the cream before it is removed from the milk, and therefore makes the best keeping butter.
5. Because it uses the least Ice—only about one-fourth as much as the deep setting system.
6. Because it requires the least labor. In no other way can the milk of a dairy be so easily cared for.

Hundreds of the best dairymen have discarded the deep setting systems, and now use the Bureau.

It is used and endorsed by such men as—

Prof. L. B. ARNOLD, Pres. Amer. Dairy Association.
RICHARD GOODMAN, JR., Lenox, Massachusetts.
A. W. CHEEVER, Agricul. Editor N. E. Farmer.
J. MILTON MACKIE, Pres. Amer. Jersey Cattle Club.
HENRY STEWART, Dairy Editor.
EDWARD BURNETT, Deerfoot Farm, Southboro, Mass.

Don't buy any Pans, Cans or Creamers,

or send your milk to the factory, until you have sent for our large illustrated Circulars and price lists.

ARM & HAMMER BRAND

& SALERATUS.

TO FARMERS.—It is important that the Soda or Saleratus they use should be white and pure, in common with all similar substances used for food.

In making bread with yeast, it is well to use about half a teaspoonful of the "Arm and Hammer" Brand Soda or Saleratus at the same time, and thus make the bread rise better and prevent it becoming sour by correcting the natural acidity of the yeast.

DAIRYMEN and FARMERS should use only the "Arm and Hammer" brand for cleaning and keeping milk pans sweet and clean.

To insure obtaining only the "Arm and Hammer" brand Soda or Saleratus, buy it in "POUND or HALF POUND PACKAGES," which bear our name and trademark as inferior goods are sometimes substituted for the "Arm and Hammer" brand when bought in bulk.

GET THE BEST A NEW BUTTER-WORKER TRY ONE

After three years of practical trial and public endorsement, we offer to Dairymen and to the Trade, our HAND BUTTER-WORKER, operating on the principle of direct and powerful pressure, instead of rolling, grinding, or sliding upon the butter.

We claim that it is the only Butter-Worker which will certainly, quickly and easily, take out all the buttermilk, and which does not and cannot injure the grain of the butter. It works in the salt as easily and as well.

THE GENUINE BLANCHARD CHURN GET THE BEST

Ensilage.—An Important Discovery.

Dr. M. Miles, Professor of Agriculture at the Massachusetts Agricultural College, made during the past summer at the Massachusetts Experimental Station at Amherst some investigations in ensilage. It is well known that ensilage ferments, acetic acid is produced, and it often has a strong odor of vinegar, or the change goes still further and alcohol is formed. Fermentation in ensilage is due to the presence of bacteria, minute fungi, the growth of which induces fermentation in a similar way to that caused by the yeast fungus in other cases. To prevent fermentation the bacteria and their germs must be destroyed, which can be most readily done by heat. Prof. Miles' experiments show that when exposed to a temperature of from one hundred and fifteen to one hundred and twenty degrees the bacteria are destroyed. In filling a silo in the ordinary manner, the temperature rises thirty degrees or more, and by properly managing the filling, the heat may be increased sufficiently to destroy the ferment. The details of the filling have yet to be determined by other experiments. This discovery promises to be of great value to all who make use of ensilage.

Catalogues Acknowledged.

Dealers, more than ever before, add new departments to their business and make it difficult to classify their catalogues. Thus seedsmen include in their lists the ordinary bedding plants and small fruits, while nurserymen generally supply florists stock. We, as heretofore, enter the catalogues under what appears to be the leading department, and note the others:

SEEDSMEN AND FLORISTS.

ALNEER BROTHERS, Rockford, Ill.—One of the firm was a member of the well-known house of J. B. Root & Co., dissolved since the death of Mr. Root. A full illustrated list.

BENSON, MAULE & Co., 129-131 Front St., Philadelphia, Pa.—A very full list, with many novelties in seeds. Also, sheep, swine and poultry in great variety.

J. BORGIA & SON, Baltimore, Md.—A number of novelties and specialties in vegetables.

WALDO F. BROWN, Oxford, Ohio, offers a number of specialties, including useful varieties of gourds.

W. ATLEE BURFEE & Co.—A very full list, including plgs and poultry of the best breeds. A separate account of the award of premium for Welcome oats and offer of prizes for the current year.

WM. H. CARSON & Co., No. 114 Chambers St., New York City.—A handsomely illustrated Catalogue, including many seeds now offered for the first time.

EDWARD P. CLOUD, Kennet Square, Pa., offer several novelties in farm seeds; has implements and live stock.

COLE & BROTHERS, Pella, Iowa.—Very full, especially in farm seeds.

A. D. COWAN & Co., No. 114 Chambers St., New York City.—A large number of novelties in vegetable and flower seeds. Also, plants, implements, etc.

WILLIAM EVANS, Montreal, Canada.—Vegetable, flower and farm seeds; a large variety of implements.

D. F. FERRY & Co., Detroit, Mich.—Besides a very full list in all departments, including plants, a supplement for specialties.

AARON LOW, Essex, Mass.—A very full list. Seed potatoes a specialty, of which a great variety is offered.

HENRY A. DREER, No. 714 Chestnut St., Philadelphia, Pa. As usual this catalogue offers plants as well as seeds. A supplement of twenty-four pages is added to describe novelties.

L. W. GOODSELL, Amherst, Mass.—Flower seeds and select list of vegetables, a colored plate of New Diamond Fancies.

J. J. H. GREGORY, Marblehead, Mass.—This list is, as usual, unique in form and contents and always interesting.

JOSEPH HARRIS, Rochester, N. Y.—Seeds for the farm, vegetable and flower garden. A choice selection.

R. D. HAWLEY, Hartford, Conn.—Vegetable and farm seeds, with numerous farm and garden implements.

PETER HENDERSON & Co., Nos. 35-37 Courtlandt St., New York, entitle their catalogue "Everything for the Garden." It is wonderfully full, with many novelties.

JOHNSON & STOKES, No. 1, 114 Market St., Philadelphia. Well illustrated with a number of novelties.

LANDRETH & SONS, Philadelphia, Pa., celebrate the hundredth year of their house by issuing a catalogue that is a marvel of beauty and a wonder in its contents.

HENRY LEE, Denver, Col.—A very full catalogue of seeds of all kinds and implements, that would do credit to a much older place.

MENDENHALL & Co., Indianapolis, Ind.—Very full in vegetables and flowers, with novelties.

NANZ, NEUNER & Co., Louisville, Ky.—A full list, including flowers as well as seeds of all kinds.

PAGE & KELSEY, Des Moines, Iowa.—Besides seeds offer greenhouse and other plants, fruit and other trees, etc.

WM. RENNIE, Toronto, Ont.—A remarkably neat and full catalogue, giving useful directions for culture.

JOHN SAUL, Washington, D. C., issues his usual catalogue of flower and vegetable seeds.

STORRS & HARRISON Co., Painesville, Ohio, issue a catalogue of seeds and one of "Dollar Collections" of roses and bedding plants.

JAMES M. THORBURN & Co., No. 15 John St., New York. Wonderfully full, compact, and instructive, with many new things. CHANGE OF FIRM.—Mr. Grant Thorburn, Jr., having retired, Messrs. J. M. Thorburn and F. W. Bruggerhoff will continue the business under the same firm name.

E. A. REEVES & Co., No. 68 Courtlandt St., New York City.—General assortment of seeds, with current novelties, implements, fertilizers, etc.

HIRAM SIBLEY & Co., Rochester, N. Y., and Chicago, Ill.—Besides vegetable, flower and farm seeds this immense catalogue contains plants, implements and fertilizers.

WM. H. SMITH, (late of the firm of Henry A. Dreer,) No. 1,018 Market St., Philadelphia, Pa.—A very full collection of seeds, implements, fertilizers, small fruits, etc.

H. N. SMITH, South Sudbury, Mass.—A select list of vegetable and flower seeds.

ISAAC F. TILLINGHAST, La Plume, Pa., sends his catalogue in "Seed-Time and Harvest," a magazine.

GEORGE S. WALKER, Rochester, N. Y.—An illustrated list of flowers and small fruits.

SAM'L WILSON, Mechanicsville, Pa.—Also roses and bedding plants. Many novelties in vegetables.

NURSERYMEN.

H. G. BREESE, Hoosac, N. Y.—Small fruits. Also, live stock, poultry, etc.

ELLWANGER & BARRY, Rochester, N. Y.—In addition to their regular catalogues have issued a supplement containing novelties in fruit trees, roses, ornamental trees and shrubs, some now offered for the first time.

DAVID FERGUSON & SON, Ridge and Lehigh Avenues, Philadelphia, Pa.—Greenhouse and hardy plants. Fine colored plate of single dabbies.

M. E. HINKLEY, Marengo, Iowa.—A special list of strawberries, which he calls "Hinkley's Shortcake."

JOEL HORNOR & SON, Merchantville, N. J.—A full and illustrated list of small fruits, including the new kinds.

W. N. HOUGHTALING, Seymour, Conn.—Small fruits; the Connecticut Queen strawberry, now first offered.

W. W. JOHNSON, Snowflake, Mich.—Trade list of tree seedlings and tree seeds.

J. T. LOVETT, Little Silver, N. J.—Mostly devoted to small fruits. Several specialties illustrated. Also tree fruits, especially peaches, and other matters.

F. K. PHENIX & SON, Delavan, Wis.—General fruit list, with special attention to crab-apples.

WOOLSON & Co., Passaic, N. J.—Hardy plants, including ferns and bulbs, many now offered for the first time.

STOCK, IMPLEMENTS, FERTILIZERS, MISCELLANEOUS.

DILLON BROTHERS, Normal, Ill.—Norman horses; an immense stock, finely illustrated.

M. W. DUNHAM, Wayne, Ill.—The catalogue of the Oaklawn Stud of Percheron horses, of nearly one hundred and forty pages, gives some idea of the number of this breed now in this country.

FREEPORT MACHINE COMPANY, Freeport, Ill.—The Stover wind mills, with pumps; tanks, etc.

TIMOTHY B. HUSSEY, North Berwick, Me. Illustrated list of plows, cultivators, and other implements.

KING & Co., Owego, N. Y. Hand-made harness.

ONONDAGA SALT.—The various salt companies in Syracuse, N. Y., unite in publishing a "manual" giving the dairy and agricultural uses of the various brands of salt.

GARDNER B. WEEKS, Syracuse, N. Y.—Grappling hay-forks, railway conveyors and attachments.

SEDGWICK BROS., Richmond, Ind.—Wire farm-fencing, gates, netting, etc.

THE MICHIGAN WASHER Co., St. Clair, Mich., describe their washer, which is claimed to be different from the many which have preceded it.

J. C. MELCHER, O'Quinn, Tex.—Insect and animal exterminator, a contrivance for blowing sulphur and other fumes into burrows, etc.

ENTERPRISE MANUFACTURING Co., Philadelphia, Pa.—A great variety of useful house and store appliances, mills, presses, choppers; also the celebrated smoothing or sad iron of Mrs. Potts, which has been welcomed into many households.

JACKSON BROTHERS, 94 Grand St., Albany, N. Y.—The New York State Drain Tile Works offer drain tiles of various styles and colors.

THURSTON & BRIGHAM, Buffalo, N. Y.—Knives, razors, and other cutlery.

W. S. BLUNT, 100 Beekman St., New York City. Catalogue of "Universal Force Pumps."

THE C-SPRING CART Co., Rensselaire, Ind.—An illustrated list of the various vehicles made by this company.

THE MAPES FORMULA AND PERUVIAN GUANO Co.—A description of the kinds of fertilizers made by the company and reports on their use the past year.

J. B. SARDY & SON, No. 141 Water St., New York City, send a pamphlet giving the composition of the various fertilizers made by them.

W. E. STITT, Sabetba, Kans.—Pure bred poultry and eggs for hatching.

J. B. & S. J. FOSTER, Sharpsburg, Pa.—High-class fowls and eggs for hatching.

DR. A. J. PONTIUS, Millersburg, Pa.—White Leghorns, Wyandottes, and other poultry.

A. C. HAWKINS, Lancaster, Mass.—Poultry, Wyandottes and Plymouth Rocks.

T. B. EVERETT & Co., 43 So. Market Street, Boston.—Manufacturers of Matthews' seed drill, also hand cultivator, and wheel hoe.

E. C. NEWTON, Batavia, Ill.—Newton's improved animal tie.

SEDGWICK STEEL WIRE FENCE.

Is the only general purpose Wire Fence in use, being a Strong Net-Work without Barbs. It will turn dogs, pigs, sheep and poultry, as well as the most vicious stock, without injury to either fence or stock. It is just the fence for farms, gardens, stock ranges and railroads, and very neat for lawns, parks, school lots and cemeteries. Covered with rust-proof paint (or galvanized) it will last a life-time. It is Superior to Boards or Barbed Wire in every respect. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick Gates, made of wrought iron pipe and steel wire, defy all competition in neatness, strength and durability. We also make the best and cheapest All Iron Automatic or Self-Opening Gate, also Cheapest and Neatest all Iron Fence. Best Wire Stretcher and Post Auger. Also Manufacture Russell's excellent Wind Engines for pumping water, or geared engines for grinding and other Night work. For prices and particulars ask hardware dealers, or address, mentioning paper,
SEDGWICK BROS. Mfrs., Richmond, Indiana.

Only Double Ring Invented. CHAMPION Hog Ringer, RINGS AND HOLDER.

No sharp points in the flesh to cause irritation and soreness, as in case of rings that close with the joints in the flesh, and produce soreness of the nose.

The Champion Hog Holder speaks for itself in
CHAMBERS, BERING, QUINLAN CO., Exclusive Manufacturers, DECATUR, ILL.

Only Single Ring Ever Invented That Closes on the Outside of the Nose.

Brown's Elliptical Ring.
And Triple Groove Hog and Pig Ringer.
This is the only Single Ring ever invented that closes on the outside of the nose. It overcomes a serious defect in all triangular and other rings which close with the joints together in the flesh, causing it to decay and to keep the hog's nose sore.
the above cuts.

POULTRY WORLD.

A monthly magazine, the oldest, largest, and best periodical devoted entirely to poultry ever published. Splendidly illustrated. \$1.25 per year. Also the *American Poultry Yard*, the only weekly paper devoted entirely to poultry in existence. \$1.50 per year. Both papers for \$2.00. A sample copy of both mailed on receipt of nine cents in postage stamps.

Address H. H. STODDARD, HARTFORD, CT.

Important! New Books!

PREMIUMS.

Any one of the four Valuable Books described below, will be PRESENTED and sent post-paid, anywhere in the United States or British America, to any person who within 30 days sends us ONE NEW SUBSCRIBER, (or his own subscription, if new,) to the American Agriculturist, (English or German) for 1884, at the regular rate of \$1.50 a year, and TEN CENTS EXTRA FOR POSTAGE, making \$1.60 in all. For every additional subscription at the same rate (\$1.60), an additional book will be sent. Thus four subscriptions, at \$1.60 each, will secure all four of these books, post-paid; ten subscriptions, ten books, post-paid, and so on. Ten cents additional for packing and postage secures the Premium Pictures. But this offer includes no Music or other Premiums.

FARM CONVENIENCES.

A Practical Hand-Book for the Farm.

READY, FEBRUARY 20, 1884.

OVER TWO HUNDRED ILLUSTRATIONS,

Describing all Manner of Home-Made Aids to Farm Work. NONE OF THESE CONTRIVANCES ARE PATENTED, and all Farmers can Readily Make Most of them for themselves.

A Manual of what to do and how to do it. Made up of the best ideas from the experience of a large number of practical men. Every one of the two hundred and forty pages and two hundred engravings, teaches a lesson in itself in Farm Economy.

This invaluable book contains simple and clear descriptions of labor-saving devices, for all departments of Farm Work. It abounds in important hints and suggestions, to aid farmers in the construction of these labor-saving devices. The volume is, so to speak, a complete hand-book for doing every-day work quickly and readily.

Among the many subjects treated are: Bins for Oats, Fastenings for Cows, Movable Hen's Nests, Management of Young Bulls, Hints for the Work Shop, Boat Building, Business Habits, Hay Racks, Manure, Relief for Spavin, Tool Boxes, Making Hinges, Watering Places for Stock, Shaving Horses, Doors, Ventilating Fodder Stacks, Harrows, Clearing Lands, Feed Racks for Sheep, Troughs, Stalls, Hog Killing, Cements, Improved Dump Carts, Prevent Washing of Hill-Sides, Stone Boats, Unloading Corn, Fall Fallowing, Lime and Lime Kilns, Ringing and Handling Bulls, Mixing Cement.

It will be seen from the above that this book covers a large field, and the need of this has long been felt, and it is certain to fill a most important place in the farm library.

CLOTH, 12mo. PRICE, POST-PAID, \$1.50.

HOUSEHOLD CONVENIENCES.

Fully Illustrated with over Two Hundred Engravings.

READY, FEBRUARY 20, 1884.

Every House-keeper can save many times the cost of the work by providing herself with a long list of cheap, easily constructed labor-saving devices. The secret of success in house-keeping is knowing how to do things quickly and well. "Household Conveniences" is a key to this secret.

A Most Complete Volume, filled with valuable Hints and Suggestions, for doing all kinds of Work in the Household. NONE OF THESE CONTRIVANCES ARE PATENTED, and all Housekeepers can readily make them for themselves.

CHAPTER I.—ABOUT THE HOUSE.—Hammocks and Tents, Garden Seats, Window Screens and Awnings, Clothes Lines, Ash Bins and Ash Sifters, Wood Racks, Disposal of House Slops, Crematories, Snow-Plows, Leaches, Lye and Soap, Screens, Carriage Steps, Vines at the Door, Cisterns, Fruit Driers, &c., &c.

CHAPTER II.—THE CELLAR.—The Cellar in General, Musty Cellars, Ventilating a Cellar, Ice Boxes or Refrigerators, Preserving Ice, Meat Safes, Water Filters, Milk Cupboards, Cheese Presses, Butter Stamps, Cellar Windows, Coal Bins, &c., &c.

CHAPTER III.—THE KITCHEN.—Flour-Boxes, Spice-Boxes, Folding Ironing Tables, Side-Tables, Bread or Kneading-Boards, Baking-Tables, Wash-Benches, Wash-Sinks, Graters and Slicers, Clothes-Driers, Summer-Drinks, Cooling-Frames, Coffee-Mills, Neat Wood-Boxes, &c., &c.

CHAPTER VI.—PANTRIES AND CUPBOARDS.—Chimney and Corner Cupboards, Well Arranged Pantries, Poison Boxes, Store-Room Boxes, &c., &c.

CHAPTER V.—THE DINING ROOM.—Cases for Silver, Convenient Side Tables, Table Decoration, Inexpensive Decoration Generally, Extension Leaf for a Common Table, How to Carve, Fruit Cans.

CHAPTER VI.—THE SITTING ROOM.—Plant Shelves, Rustic Window Boxes, Picture Frame, Vines in the Window, Decorative Art Flower Boxes, Hanging Baskets, Care of Carpets, Carpet Sweeping, Hat Racks, Stove Pipes, Lamp Shades, Canary Birds, Ornamental Wood Boxes, Paper Holders, &c., &c.

There are other chapters on the Library, the Sewing Room, &c., &c.—all making the most exhaustive work of the kind extant. This Volume abounds in common sense hints and suggestions from scores of experienced house-keepers, is within the reach of all, and should be a daily consulted work in every home.

CLOTH, 12mo. PRICE, POST-PAID, \$1.50.

RECENTLY PUBLISHED.

BARN PLANS AND OUTBUILDINGS.

Two Hundred and Fifty-seven Illustrations.

A Most Valuable Work, full of Ideas, Hints, Suggestions, Plans, etc., by Practical Writers, for the

Construction of Barns and all Outbuildings.

Chapters are devoted, among other subjects, to the Economic Erection and Use of Barns. General Farm Barns, Cattle Barns and Stables, Dairy Barns, Sheep Barns and Sheds, Carriage Houses, Poultry Houses, Figgeries, Tool Houses, Corn Houses and Cribs, Ice Houses, Ice Houses and Cool Chambers, Dairy Houses, Spring Houses, Granaries, Smoke Houses, Dog Kennels, Bird Houses, Root Cellars and Root Houses.

The very large number of Illustrations, more than Two Hundred and Fifty in all, constitute a most important feature of the work, presenting to the eye, as they do, designs and plans for every kind of Barns and Outbuildings.

The proper and economical erection of Barns and Outbuildings requires far more forethought and planning than are ordinarily given to their construction. A barn once built is not readily moved or altered in size or shape, and the same may be said of a corn-house, a poultry-house, or even a pig-pen.

Illustrated Works upon Barns and Out-door Buildings have hitherto been so expensive as to limit their circulation to comparatively few in number. This Volume of two hundred and thirty-five pages, and two hundred and fifty-seven Illustrations and Engravings, is sold at so moderate a price as to be within the reach of all. Every professional builder, and every person, be he farmer or otherwise, who desires to erect a barn, or any outbuilding, can, in this book, secure a wealth of designs and plans for a comparatively trifling sum.

CLOTH, 12mo. PRICE, POST-PAID, \$1.50.

JUST PUBLISHED.

COTTAGE HOUSES FOR VILLAGE AND COUNTRY HOMES.

TOGETHER WITH

COMPLETE PLANS AND SPECIFICATIONS.

By S. B. REED, ARCHITECT,

Author of "House Plans for Everybody," etc.

WITH OVER ONE HUNDRED ILLUSTRATIONS.

General descriptions, and detailed estimates of materials, construction, and cost, are given with each plan—by which any intelligent person may readily comprehend the character of the buildings, and which will enable any builder of ordinary experience to prepare his estimates—corrected by the varying circumstances of locality and prices, and proceed to their erection. Nearly all these plans have been built from, and their practicability proven. They embrace a great variety of arrangement, and are adapted to meet the general want for convenient, comfortable, and economic homes.

CONTENTS.

DESIGN I.—A Cottage, costing \$600. II.—A Cottage costing \$750. III.—A Convenient Cottage, costing \$1,000. IV.—A Convenient Cottage, costing \$1,000. V.—A Complete Cottage, costing \$1,100. VI.—A Farm House, costing \$1,200. VII.—A Country Cottage, costing \$1,500. VIII.—A Country House, costing \$1,500. IX.—A Country Cottage, costing \$1,600. X.—A Swiss Cottage, costing \$1,600. XI.—A Cottage for Country, costing \$1,800. XII.—A Half Stone House, costing \$2,000. XIII.—A Suburban Cottage, costing \$2,200. XIV.—A Double Cottage, costing \$2,500. XV.—A House, costing \$2,500. Kind Words.

Mr. Chester P. Dewey, the well-known literatus of Brooklyn, writes under date of January 31st: "I have received the February *American Agriculturist*. It is a tip-top number, beautifully illustrated, and ought to fetch everybody engaged in Rural Life, from Maine to the Pacific."

Worth Millions.

LYLAR, Ill., Jan. 8, 1884.
"I have been a subscriber of your most excellent paper for several years. Its exposure of frauds is worth millions to the people."
G. W. LANGFORD.

Won't be Without It.

OSAGE, Iowa, Jan. 6, 1884.
"I did not take the *American Agriculturist* last year. I am very sorry I did not, will be careful not to be without it any more."
C. F. LEMEN.

Doubles in Value Every Year.

NEWTOWN, Pa., Dec. 29, 1883.
"A subscriber since 1862, I still find that every year it increases doubly in value."
JOS. C. CAMIN.

More than Twenty Years.

RIVERSIDE, Me., Dec. 31, 1883.
"I have been a subscriber to the *American Agriculturist* for more than twenty years, I think without missing a single year, and shall renew this year."
E. L. BROWN.

Our Dictionary and other Premiums.

The Satisfaction they Give.

RANDOLPH, Wis., Jan. 11, 1884.
"The Dictionary was duly received, am very much pleased with it; better than expected."
D. MALLINSON.

Very Complete.

PHILADELPHIA, Pa., Jan. 5, 1884.
"Please accept my thanks for the valuable present of the Dictionary. It is just what I wanted, and is certainly a very complete work."
L. M. LONG.

Speaks a Good Word.

SPRINGFIELD, Mo., Jan. 5, 1884.
"Yes, I shall welcome the *American Agriculturist* to my new home as an old friend; and the Dictionary and Picture shall stimulate me to speak a good word for you on all suitable occasions."
W. H. CRAIG.

Very Nice Indeed.

STRONG'S PRAIRIE, Wis., Dec. 14, 1883.
"I am just in receipt of the Dictionary. It is very nice indeed, and thanking you very much, I remain,
Very sincerely yours,"
J. F. SPOON.

Supplies a Long-felt Want.

ELLCOTT CITY, Md., Jan. 9, 1884.
"I must not forget to thank you for the Dictionary sent as a Premium, as it supplies a long-felt want, and I appreciate it very much,"
H. TEMMINK.

Much Pleased.

LANESVILLE, Ind., Dec. 27, 1883.
"The Dictionary arrived in good order, am very much pleased with it."
D. W. GRESHAM.

Splendid Premiums.

Dec. 25, 1883.
"I have received your splendid premiums. The picture is beautiful; the Dictionary is both beautiful and useful, for which you have my thanks."
W. E. HOLLISTER.

"I thank you for your promptness in sending to the subscribers I sent in. They are all much pleased with Dictionary, paper and engravings. I hope to send another batch of names in a few days, and will do all I can for your paper."
JAMES WAY.

The Engravings Alone Worth the Price of All.

PENACOOK, N. H., Jan. 15, 1884.
"I have received the papers, Dictionary and Engravings all right. Am very much pleased with them all. The Engravings alone are worth the price of them all."
Very respectfully,
W. H. WILLIAMS.

The Acme Pulverizing Harrow.

"We have received from the Messrs. Nash & Bro., manufacturers, a two hundred and fifty-two page volume of recommendations and indorsements of the Acme Pulverizing Harrow. A year ago we took occasion to express our opinion regarding this Harrow, and all we have since heard from subscribers of the *American Agriculturist*, not only justifies what we have said, but coincides with the views now expressed in this volume."

ORANGE JUDD CO., 751 Broadway, N. Y.

AN UNSEEN WORLD Revealed to Every Eye.

The unaided eye sees but *very little* of the universe. The telescope brings to our knowledge vast numbers of worlds the existence of which we

Fig. 1.—MICROSCOPE CLOSED.

should have had no conception, without its aid. There is also all around us a world invisible to our natural eyes; and only by using the Microscope can we see and study its wonderful inhabitants. By this we find that there are myriads of things hidden from us by their minuteness—indeed thousands, if not millions, for every one that is visible.

We find that there are animal forms that move, feed, multiply, and apparently enjoy themselves, yet so small that millions of them gathered in a space as large as a silver dollar, would each have abundant room to sport and play! [See next page.]

Not only are there minute forms of animal life, but there are innumerable plants so small that no one is aware of their existence until it is revealed by the Microscope. These Little Things are not only interesting, but to see and know them is of

Great Importance to Us.

The greatest harm to our Crops, our Animals, our Fruits, our Flowers, even to our Bodies, is found to be due to *living* things, both vegetable and animal, so small that they have until recently escaped our knowledge.

Do You Want to See some of these small but wonderfully interesting things? We are now prepared to help every reader of the *American Agriculturist* to some conception of them, to help look a little way down into this unseen world.

The American Agriculturist Compound Microscope.

This was specially devised for the readers of the *American Agriculturist*; it is partially described on the following page. This instrument will enable one to examine, and to see very distinctly and clearly, a vast multitude of interesting things, each one a thousand times smaller than the tiniest thing that you can see with the unassisted eyes. This instrument, as you will learn from the description, is accessible to all our readers, either without cost, or at a cost far below anything like it was ever before offered—at a cost so small that if you knew how valuable it is, you would spare no sacrifice or effort to get it immediately.

Not a **Family**, not a **Teacher**, not a **School**, in all the land, should be without one. It would be of more interest to all, and to most people more useful, than anything else they could buy for many times the cost.

Creeping and Walking.

The adage has it, "we must creep before we can walk." That is not quite true in *this* case. While every one may begin with a Simple Microscope and go on to a Compound one, the Compound Microscope we have above referred to, is so constructed, and its use so fully explained in the descriptions and directions accompanying each instrument, that the merest novice, or even a child, can very quickly learn to use it with unbounded interest and satisfaction. But while we advise all to look into the value and importance of the Compound Microscope and examine its great capabilities, we have

A NEW AND Most Interesting Announcement TO EVERY READER OF THE American Agriculturist, AND TO THEIR FRIENDS.

The Publishers have the great pleasure of announcing that they have within the past month succeeded in having made expressly for them a **new and most valuable Simple Microscope**, which is pronounced by experts, by the highest scientific authorities in such matters, to be the most complete, most perfect, and most useful instrument of the kind ever devised in this or any other country, that can be produced and supplied for anything like the low cost of this one.

And Still Better.

By special arrangement to have them manufactured on a large scale, with automatic machinery, (which not only secures entire *uniformity* in quality and a perfection far beyond former methods, but re-

Fig. 2.—MICROSCOPE READY FOR USE.

duces the cost to a small fraction of the former hand manufacture), these most useful instruments are now brought within the easy reach of every man, woman, and child. Our arrangements will enable us to speedily provide

ONE FOR Every Subscriber TO THE American Agriculturist.

Safely packed for carriage and delivered free to any part of the United States or Territories.

[See "How Supplied" first column next page.]

DESCRIPTION.—The *American Agriculturist* **NEW Simple Microscope** is shown in fig. 1, ready for packing in its box, while fig. 2 shows the lenses raised and ready for use. The stand

Fig. 3.—MIRROR.

or body is of nickel-plated metal (resembling silver and untarnishable). It stands upon a broad bottom. An opening on one side admits light within to a

Circular Mirror, fig. 3; this concentrates and throws the light up to the object examined. This Mirror is so suspended that it can be turned to any angle required by the incoming light from a window, or from a lamp at night. This *Mirror* is of great importance, and is one of the very decided improvements upon the former Simple Microscope supplied seven years ago to our readers. By its aid the needed extra illumination of the object to be examined is provided. At the top of the stand is a **Glass Stage** set in a frame like a watch crystal.—Two nickel-plated **Spring Clips**, fig. 4, over this stage, hold firmly upon it the slides that carry the objects to be examined.—The Microscope is also accompanied by **two Glass Plates** or slides, and also, to be placed between them, a waterproof **Cell** for holding seeds, insects, and other small objects and fluids. **The**

Fig. 4.—SPRING CLIPS.

Lenses, figs. 5 and 6, are of course the most important thing in any microscope. In this instrument there are **THREE** of them, of different powers, and so arranged that one can be used where low power is required; a second one for a little higher power, and a third for a still higher power. Then again any two can be combined for other powers, and all three when the highest power of the instrument is desired. Thus *seven* different powers can be quickly provided, ranging from a magnifying power of seven diameters up to twenty-five or more. (It will be understood that if a lens magnifies twenty diameters, that is twenty times in one direction, it magnifies equally in all directions or twenty times twenty areas, or four hundred times (less what is taken off from the corners, in cutting a circle out of a square). A circular area of twenty-five diameters is nearly five hundred times that of one diameter, and this (500) is the magnifying power of these three lenses used together.) They are of highest quality glass, and ground to perfection, of course by automatic machinery so that there can be no variation of curvature.—They are as free as possible in an instrument of this kind from the imperfections of ordinary lenses, in fact nearly achromatic, a point not even attempted in the great mass of cheap microscopes sold at moderate prices.—A **Diaphragm** (shown at the lower left-hand of fig. 5, and in fig. 6) is provided to cut off outside light in examining minute objects, and concentrate the vision upon a single point. This turns in or out as needed.—All the Lenses are attached (as in fig. 6) to a **Sliding Rod Standard**, fig. 7, which is moved up and down in a tube by the thumb-piece, making it thus easy to adjust the lenses to any desired distance from the object, and to suit them to different eyes.

Fig. 5.—LENSES AND DIAPHRAGM, SEPARATE.

The whole apparatus is packed in a neat **Box**,

adapted to hold it for carrying safely by any conveyance, and for keeping it in when not in use.

We can conceive of no more convenient arrangement of all the parts for practical use, than are combined in this remarkable Single Microscope.

Usefulness of the Microscope for Farmers, and Others.

A Microscope is valuable to **Farmers**—to detect the cause of diseases of plants and animals, whether due to insects, such as scab, etc., or to fungi, as mildew, etc.; to detect adulteration in seeds, and their de-

Fig. 6.—SINGLE MICROSCOPE. LENSES ON STANDARD.

gree of goodness or badness, the proportion of fertile and infertile seed; also adulteration in fertilizers, ground bone, etc.; to examine wounds and bruises, extract splinters from the hands, etc., etc. The Microscope is equally useful to **Gardeners, Florists, Fruit-growers, etc.**, for most of the above purposes, and for many others too numerous to specify.

The Microscope is useful to **All Classes**, to detect adulterations in food, as in coffee, tea, spices, sugar, and to examine the texture and defects of many articles.

As a source of **Instructive Amusement**, the Microscope is exceedingly valuable to **Children**, to **Young people**, and to **Grown people**. The beautiful

forms and structure of the most minute flowers, of insects, etc., are wonderful when examined by even a Microscope of very moderate power. The dust on the wing of a butterfly or moth becomes, in the Compound Microscope most beautiful feathers or other forms. Mold on cheese or a shoe becomes to the eye a forest-like growth. The structure of the soil under our feet, its curious mixture of crystals and broken rocks, are interesting to examine. A drop of spirits of camphor put on the glass is seen shooting into wonderful crystals, as the liquid evaporates. *Hundreds of other things*

may be examined, furnishing varied instruction, and most elevated entertainment.

As an interesting Toy, nothing else equal to a fairly good Microscope can be given to Children.

How Supplied.

This Simple Microscope is more valuable in the quality of its lenses, its arrangements, etc., than any thing we have ever seen offered for several dollars. Probably its equal can nowhere else be had under four or five dollars. But it will be supplied by us and sent *delivered free* to any part of the United States and Territories for two dollars, and *delivered free* to any actual subscriber to the *American Agriculturist* for 1884, for **One Dollar and twenty-five cents**.

FURTHER.—We will present one, delivered free, and send the *American Agriculturist* to a new subscriber, post-paid, during all of 1884, for two dollars.

FURTHER.—We will present this Microscope to any present subscriber, and **deliver it free** to him, who will send us two new subscribers to the *American Agriculturist* for one year, at one dollar and fifty cents each.

Take Notice ALL Subscribers.

Any person already a subscriber to the *American Agriculturist*, can have one of the above Microscopes delivered free to him for one dollar and twenty-five cents.

A Remarkable Instrument—Of Great Value to All;

Brought within the reach of almost Everybody—Costs scarcely one-fifth of former less Valuable Instruments—Reveals all around us a World of Objects far more numerous and even more interesting and beautiful than all we can see with our natural eyes—Useful in Many Ways—a Perpetual source of Pleasure and Instruction to YOUNG and OLD—It should be at once placed in every Public and Private SCHOOL not already supplied, and in Every FAMILY—Valuable to Physicians, etc., etc.

Fig. 2.—EYE-PIECE.

—The New American Agriculturist Compound MICROSCOPE.

With a Compound Microscope we have actually seen and measured living, moving animals, so small that 10,000,000,000 would only fill a box one inch in diameter—that is, seven times as many of them as there are of people in the world!—We have a bit of swine's flesh barely visible to the unaided eye, which, under the Microscope, is plainly seen to contain seven separate nests of Trichines that look like so many monstrous serpents.—The unseen world all around us is full of such wonders. The Microscope opens up this world to our eyes! The greater the power of the Instrument, the greater is the extent of the world thus revealed.

For the special benefit of the readers of the *American Agriculturist*, the Editors, after years of thought on this subject, and many experiments, succeeded in having an excellent Compound Microscope of quite large power, constructed by automatic machinery, which makes the parts far more perfectly, and

Fig. 4. Microscope condensed in Walnut Case (3 1/2 x 4 1/2 x 3 1/2 inches), in which it is firmly held for carrying or keeping.

Fig. 3.—CAMERA LUCIDA IN USE.

at far less cost than the former slow hand-work.—It has also combined with it a new, simple **Camera Lucida**, which enables even a child to sketch upon paper large permanent pictures of objects so small as not to be visible to the naked eye—such as the dust on a moth or butterfly shows like feathers or scales, 3 or 4 inches across, and in infinite variety of form, shape, and coloring; the foot of a fly, flea, etc.; the tiny and nearly or quite imperceptible insects that destroy our plants and clothing, or produce diseases in our plants and animals; the pollen of flowers, etc.—It enables farmers, gardeners, and fruit growers to examine and recognize insects, foul seeds, fungi, etc., etc. It is useful to all physicians. Every family will find it intensely interesting, and no **School**, Public or Private, should be without one. (See offer below.)

Price \$15 (or \$10 to *American Agriculturist* subscribers, for whom it was specially designed).—This price includes the *Camera Lucida*, the Walnut Case (fig. 4) packed in an exterior box, so that it will go safely anywhere by express; also a free copy of Prof. Phinn's Book on the Microscope, some glasses, etc.—Carriage paid by recipients.

The whole will also be **Presented** to any one furnishing 10 subscriptions to the *American Agriculturist* at \$1.50 a year each. The Teachers or Pupils in every school not already supplied should at once make up a subscription club, and secure this Microscope for the benefit of all. Plenty of people would take the paper for their own use, when by so doing they would help so valuable an enterprise.

N. B.—Any one desiring the above Microscope for immediate use, or as a present, can forward \$10 and receive it, and deduct the \$10 from the subscription money if he afterwards makes up a Premium Club for it, as above offered.

THE MAPES COMPLETE MANURES,

Some of the large and "First Premium" crops grown during the past season, where the Mapes Manures were used. Additional strong testimony on their Lasting Effects, prevention of disease, scab, damage by worms, etc. Superior quality of crops and earlier maturity, particularly of Potatoes, Tobacco, etc.

POTATOES—240 bushels per acre (20 acres); 355 (second application); 385, 400, 450, 473, 600 and 684 (on less than one acre).

CORN—2,038 bushels (ears) on 16 acres—cost less than 31½ cents per bushel; 100 bushels shelled per acre.

OATS—50, 60, 80 and 81 bushels (very heavy weight) per acre.

WHEAT—45, 46, 48 bushels per acre.

CABBAGES—10,000 heads; cauliflowers 181 and 199 barrels per acre.

Also large yields of SWEET POTATOES, TOMATOES, SWEET CORN, BEETS, PEAS, EARLY TRUCK.

The following Mapes Manures may be applied to **hood crops at any hoeing or disturbance** of the soil. They are **fine, dry, in excellent mechanical condition**, and may be easily applied by hand.

SINGLE BAG (200 lbs.) SOLD AT TON (2000 lbs.) RATE TO ENCOURAGE EXPERIMENTS.

Potato Manure	\$50 00	ton.	\$5 00	bag.
Corn Manure	48 00	"	4 80	"
Cauliflower and Cabbage Manure	47 00	"	4 70	"
Tobacco Manure ("Conn. Brand")	52 00	"	5 20	"
Fruit and Vine Manure	37 00	"	3 70	"
Onion Manure	52 00	"	5 20	"

ONIONS—1,004 bushels per acre (502 on one-half acre).

ONION SETS—2,700 bushels on 12 acres (dry season). Theo. F. Baker, President N. J. Horticultural Society.

STRAWBERRIES—6,000 quarts per acre.

ASPARAGUS—1,500 (2½ lbs.) bunches per acre.

TOBACCO—1,800, 2,000, 2,550 lbs. per acre.

Early Vegetable and Truck Manure	\$52 00	ton.	\$5 20	bag.
Grass and Grain Spring Top-Dressing	50 00	"	5 00	"
Lawn Top-Dressing (with Plaster)	35 00	"	3 50	"
Potash Bone Phosphate	40 00	"	4 00	"
Ammoniated Dissolved Bone	32 00	"	3 20	"
Nitrogenized Super-Phosphate	35 00	"	3 50	"

Every bag of the above Manures is *plainly* branded, besides having a tag attached, upon which is printed the GUARANTEED ANALYSIS and FULL DIRECTIONS for use, so that there can be *no confusion* or difficulty in their proper use, even when *several different* brands are received at the same time.

The above named Fertilizers are *delivered free on cars or boat at New York or Newark, N. J.* Special attention paid to effecting low freights.

TERMS, net cash. Money may be remitted at our risk by bank draft on New York, post-office order, or registered letter. No discounts.

No. 1 Peruvian Guano, Pure Bone, Fish, Chemicals, and Super-Phosphates, from \$20 to \$70.

PROF. S. W. JOHNSON, in the Annual Report of the **Connecticut Agricultural Station**, January, 1884, page 30, says: "No. 987, Mapes' high-grade Super-phosphate contains *more than double* the amount of *Soluble Phosphoric Acid* usually found in high-grade Super-phosphates, and at \$70 per ton retail, we believe is the **Cheapest source of Soluble Phosphoric Acid in our Market.**"

In same Report, page 32, Prof. Johnson states: "The average cost of **Nitrogenous Super-phosphates** (63 samples) is \$41.42, the average "estimated value," \$34.90, and the average difference between cost and valuation is \$6.52 per ton.

The average cost of the ten samples of the manures and fertilizers sold by the Mapes Company in the State of Connecticut, season 1883, analyzed and "valued" by Prof. Johnson and reported in full in the Annual Report, 1884, was \$52.40 (selling price) and the average "estimated value" was \$51.48, making the **average difference between cost and "valuation" less than one dollar per ton.**

Send postal for descriptive pamphlet, containing reports from farmers, fruit growers, truckers, etc., also interesting experiments. Address,

THE MAPES FORMULA AND PERUVIAN GUANO COMPANY, 158 Front Street, New York.

Peters' Eclectic Piano Instructor.

COMPILED BY W. C. PETERS.
PRICE \$3.25.

Among the great and successful Piano Methods of the day, **PETERS' ECLECTIC** has always held an honorable place. The sale of a QUARTER of a MILLION COPIES is proof tangible of its worth, and of the favor with which it is regarded, especially in a large number of educational institutions, in which it has long been used. A practical, well graded and thorough book!

Dobson's Universal Banjo Instructor.

BY H. C. and G. C. DOBSON.
PRICE \$1.00

The Banjo is now a fashionable instrument, and the best ones are elegant enough to go anywhere. A good book, destined to be very popular. Contains Elements, 57 bright Reels, Jigs, Hornpipes, etc., and 22 Popular Songs, such as "Old Folks at Home," "Over the Garden Wall," the songs of Dave Brabam, etc.

Winner's Popular Ideal Methods.

For Violin, For Guitar, For Piano, For Cornet, For Flute, For Cab. Organ, For Clarinet, For Banjo, For Flageolet, For Fife, for Accordeon, for Boehm Flute.

Price of each book 75 cts.

Immensely popular cheap instructors, with brief instructive course, and each with about one hundred neatly arranged popular airs for practice.

How Watch Cases are Made.

Most persons have an ambition to carry a gold watch case, and yet few people know how a watch case is made, or the vast difference in the quality of them. In a **SOLID GOLD WATCH CASE**, aside from the necessary thickness for engraving and polishing, a large proportion of the metal is needed only to stiffen and hold the engraved portions in place, and supply strength. The surplus is not only needless, but undesirable, because gold is a soft metal and cannot furnish the stiffness, strength and elasticity necessary to make the case permanently strong and close-fitting. The *perfect* watch case must combine gold with some metal that will supply that in which the gold is deficient. This has been accomplished by the **James Boss' Gold Watch Case**, which saves the WASTE of needless gold, and INCREASES the SOLIDITY and STRENGTH of the case, and at the same time reduces the cost ONE HALF.

Send 3 cent stamp to Keystone Watch Case Factories, Philadelphia, Pa., for handsome Illustrated Pamphlet showing how James Boss' and Keystone Watch Cases are made.

Canvassers Wanted Everywhere.

Good pay, appropriate and lucrative occupation for ladies as well as men. Profitable work for the spring months. See elsewhere for full particulars.

April to April.

As every number of the *American Agriculturist* is complete in itself, new subscriptions can begin with any issue. Do not suppose that because three months of this year are gone it is too late to subscribe for 1884. New subscribers can begin with this April issue and have their subscription continue until April next year. There is no better month to subscribe for a farm journal than the present, when spring work on the farm is commencing and nature wakes from long winter repose.

Our Microscope.

The demand for our new Microscope, of which full particulars were given in the last issue of the *American Agriculturist*, is so great, our friends will have to bear with us a little until their orders are filled. The Microscope will be sent to them in the order in which their applications are received. If any delay occurs, it will be due to the fact that our manufacturers are employing every means to render the new Microscope, made expressly for us, as nearly perfect as possible. See elsewhere.

Our Book Premiums.

The demand for the four valuable books offered by us last month as Premiums for new subscriptions to the *American Agriculturist*, has been so great that we have decided to extend the time during which they may be procured for thirty days longer. Farm Conveniences, Household Conveniences, Barn Plans, and Cottage Houses are, each one of them, worth more than the subscription price. Any one of these books, however, will be presented free at our office to the sender of a new subscription with \$1.50 (his own if it be new), or will be sent by mail on receipt of 10 cents extra for postage.

Do not be Imposed upon.

We last month gave a description of the bogus Agricultural papers, which thrive by lottery and other fraudulent schemes. The House of Representatives at Washington has now passed a bill, excluding from the mails, all papers advertising lottery schemes. If this bill becomes a law, it will deal a death-blow to the bogus agricultural papers, which steal all their agricultural matter from this periodical, and other meritorious journals, like the "Country Gentleman," for example, and then make use of the mails to float their fraudulent schemes among farmers. For further particulars, see the back part of this number.

Our Advertising Patronage.

The great display presented by our advertising columns during the past period of depression is a marvel to other journals. The secret of this success is due not only to the large circulation of the *American Agriculturist*, but to the fact that we exclude from our columns all advertisements of a doubtful character. During the past year advertisements to the amount of nearly \$50,000 have been declined because we could not safely endorse the advertisers. The very day on which we write this paragraph, various advertisements amounting to over one thousand dollars have been received for insertion in this April issue of the paper, but have been refused because not of an unexceptionable character. We know of but one other paper which would not have inserted all of these advertisements.

GARDEN AND

April is a busy month and all work should have been thoroughly planned before this. Sow early crops only so soon as the ground can be properly prepared. A good seed bed is the first essential in successful grain growing. Make the soil deep, rich and mellow. Use all the barn-yard manure to be obtained and supplement with a good commercial fertilizer. Too many farmers starve their crops and therefore cry poverty themselves. Sow only the best varieties of grain. Give a well-prepared soil a chance to produce the best of the best. Take good care of the crops after they are sown. Keep the horse cultivator running, and kill all weeds in hoed crops before they get old enough to steal the costly plant food. No soil, however rich, has any room for thistles, plantains, or other plant pests. Lead the work instead of being driven by it.

Live Stock Notes.

The coat is now changing on horses and cattle, and carding aids in shedding the hair. Avoid medicines as a rule. Horses hard at work need a plenty of dry, wholesome food. Look well to the feet and those parts upon which the harness may make galls. Keep the collars clean, and close fitting to the shoulders. Garget in new-milch cows may be prevented by frequently drawing away the milk from the udder. Calves are easily taught to drink from the pail. Remove them from the cows on the third or fourth day. Save only superior calves from the best cows to build up the herd. Ewes with lambs need abundant feed or else they and their young will suffer. If ticks become troublesome use a dip of tobacco water. The pig is a machine for converting house wastes and corn into pork. Keep this fact always in the mind.

Orchard and Fruit Garden.

Planting is the important work of the month. A horticultural friend declares that trees are not to be "set," that posts are set, but trees should be "planted." Orchard planting will be an important work, and the manner of doing it will influence the future well-being of the orchard. A nursery tree when taken up is deprived of half or more of its roots. If it is planted with all of its top, each bud upon every branch will make a demand for food, which the roots cannot meet. The growth will be a poor, starved one, and the orchard will make a bad beginning. Nurserymen do not prepare the trees for planting; they know that the inexperienced buyer will judge of the trees by the size of the top. It is important that each branch be cut back to diminish the demand upon the roots.

Grafting should be finished. A good fruit tree occupies no more room than a bad one. Insects demand attention. So soon as there is food insects will be ready to eat it. Watch for the first "tents" of the caterpillar and remove them while small.

Cuttings of shrubs, grape vines, etc., should be set out early. A mulch over the surface of the soil before dry weather comes will greatly help them.

If berries are to be shipped ascertain what

See another Page for
NEW PREMIUMS for
New Subscribers.

baskets are most popular in the market, and use that kind. Have all crates plainly marked.

Kitchen and Market Garden.

Success in the garden largely depends upon having good seeds and sowing them at the right time. Do not depend upon seeds of doubtful vitality, but test them beforehand. Count out twenty seeds and sow them in a cup or other vessel of soil, and note what share comes up. The seeds of tender vegetables should not be sown until the proper time to plant corn. In raising vegetables for market sow those kinds that are popular in the locality.

Plants in hot-beds should be hardened off gradually to prepare them for the open air. Hot-beds at this season need close attention. If the sashes are left closed a short time, the hot sun will destroy the plants and undo the work of weeks. In sowing seeds success often depends upon bringing the soil in close contact with them. Some gardeners tread down the soil over the seeds with the feet.

Asparagus is a crop well suited to farmers. It is always in demand and the market rarely overstocked. If not sold at once it will keep several days. Sow seeds to raise plants with which to set out a field next year. Prepare the soil as for a root crop, mark out drills fifteen inches apart and sow the seeds rather thinly, covering an inch deep. When well up keep clean by use of the hoe and thin with the hoe, leaving the plants as far apart as the width of its blade. If they have good soil and good cultivation the plants will, in one season, grow large enough to set out the next spring.

Flower Garden and Lawn.

The lawn should be cleared of leaves, sticks and other rubbish by the use of a rake or a stiff stable broom. Artificial fertilizers are preferable to stable manure, unless that is so well decomposed that all weed-seeds are killed. A hundred pounds each to the acre, of nitrate of soda and some good superphosphate, make an excellent dressing for lawns.

The decoration of small lawns in village and city front yards is more effective with a single bold clump than to cut it up with small flower beds. A group of castor-oil plants, or if the place is small, a single one, is very showy; a clump of cannas surrounded by gladioluses is also effective. Where flowers are grown to be seen in the bed, one does not like to cut them. Have a separate bed to supply cut flowers in plenty to which all who wish flowers can go without asking permission.

After herbaceous perennials have been three or four years in one place they need to be taken up, divided, and re-planted in fresh soil. This should be done very early. Coleuses, geraniums, and other bedding plants should not be planted out until the soil is warmed, and it should be well enriched. If there are no woody climbers upon the porch or veranda, such as honeysuckles, etc., plant some this spring. Annual climbers—morning glories, cypress vine, thunbergia, canary-bird flower, etc.—are useful to hide unsightly fences, etc. Sow the seeds when the soil is warm and dry.

Green-house and Window Plants.

The increasing heat of the sun makes ventilation necessary, and the demand for water must be supplied. Plants that are to go into the border must be hardened off by gradual exposure. Insects will rapidly increase and frequent attention will be needed. Hyacinths, tulips, etc., that have bloomed may be turned out into a reserve bed, and will give flowers useful for cutting in future years. Shading will soon be needed. Small green-houses and windows may be shaded by a curtain of sheeting. Large green-houses are most conveniently shaded with common lime white-wash, made rather thin. This is spattered upon the glass with the brush, thinly at first, increasing the spattering weekly, as the sun gets hotter and more protection is needed. Seeds of balsams, asters, and many others, may be sown in boxes in the window. Gladiolus bulbs may be planted as soon as the soil is dry. Make plantings at intervals of a week or so.

An Above-Ground Cellar of Wood.

In January, page 11, Mr. Rexford strongly recommended building cellars above ground, and not under the dwelling, as is the nearly universal custom, and he gave some good reasons. In response to our call for suggestions, plans and estimates, Mr. Fred. Grundy, Morrisonville, Ill., sends us a sketch and description of one made of wood, which he says answers its purpose fully as well as one made of brick; that nothing has ever frozen in it, and that once when the thermometer marked thirty-nine below zero outside, the one inside indicated thirty-four above, and a lighted lamp raised it to forty degrees in an hour. Its floor is on a level with that of the kitchen, with which it is connected by an enclosed passage, twelve feet long, lighted with a small window on one side and a large pane of glass in the door on the opposite side.—The foundation is two walls a single brick thick, extending eighteen inches into the ground, with a space between of one foot filled with well packed clay. On these walls sills made of two planks eighteen inches wide spiked together, are laid in cement, making them rat and mouse proof. The above-ground walls, eighteen inches thick, are formed with studding of planks two inches thick and sixteen inches wide, covered on the inside with planed inch-thick boards, and the same on the outside battened. The outer boards, standing upright, will need one or more horizontal pieces for nailing them to, or they would be spread by the packing material, if only nailed to the sills and plates. The space is filled with dry sawdust, which needs to be well stowed or it will settle and leave a blank space at the top. The ceiling is of inch boards nailed to two by six inch tie-beams or joists, covered with full two feet thickness of dry sawdust. The roof is of boards, sheathed tightly and covered with rubber roofing held down with battens. Any material desired can be used for the roof; shingles, or better still, tin or galvanized iron is preferable to rubber or tarred paper, unless well protected with a gravel or asbestos covering, as a low roof is subject to fire from sparks. The building is lighted by one double sash window, fitted with a sliding shutter inside. It has only one door, which opens into the pas-

Fig. 1.—EXTERIOR OF AN ABOVE-GROUND CELLAR.

sage. In the ground-plan, fig. 2: *a* is the door; *b*, window; *c*, passage. A ventilator in the center of the roof can be opened or closed from the inside. Two grape-vines trained to cover the east and west sides aid in keeping the walls cool in summer. A well grown and closely trimmed holly hedge, twelve feet from the building, on the north and west sides, is a valuable feature, as it causes the snow to bank high against the building and act as a blanket during the severe weather which usually follows a snow-storm. The cellar is kept clean and wholesome and used as a dairy as well as a cellar, winter and summer. The size and height may be adapted to the wants of the owner. Of course the passage-way may be twelve feet as

stated, or longer or shorter, allowing only length enough for the outside door. If such a cellar be used for a dairy room it is important to have an apartment with a perfectly tight division wall, as butter, and milk are very susceptible to odors from roots and vegetables. For a large vegetable and root or fruit cellar an outside double door opening

Fig. 2.—GROUND PLAN OF CELLAR.

directly into the cellar, will save much labor in carrying these articles around through the passage-way. The window might be constructed sufficiently large to admit of passing them through.

Some Vegetables not Generally Grown.

POTATO ONIONS.—Those who wish early onions, can have them sooner from these than from sets. The seedsmen sell the bulbs, which soon grow into large ones. The Top Onions behave in the same manner, but we have not had so much experience with these. We find the Potato Onions very useful in the family garden. Try some of them.

SALSIFY is not generally grown, at least not in farmers' gardens. It is as easily managed as parsnip or other roots. The root is rarely more than an inch through at the larger end. By giving it a rich soil and thinning to five or six inches apart in the row, the size may be increased. This is often called "Oyster Plant," or "Vegetable Oyster." A soup made from it has somewhat the flavor of oyster soup. It may be cut into inches and stewed, or boiled tender, dipped in batter and fried.

SWEET HERBS will be in demand next winter, and should be provided now. The usual kinds are: Sage, thyme, summer savory, and sweet marjoram, to which may be added tarragon, basil, and spearmint. The first three named above should be sown in a seed bed, as soon as the weather is settled and the plants kept free of weeds, and well cultivated until June or July, when they may follow some earlier crop. The plants may be set a foot apart each way. Sweet Marjoram does best if sown where it is to grow. Sow the seeds in rows a foot apart, and then thin to the same distance in the row. Tarragon is a hardy perennial with a pleasant flavor, and is used in salads and pickles. The roots may be bought of the seedsmen. Mint, or spearmint, is much in demand in spring for the "mint sauce," to accompany spring lamb, and an excellent flavoring for soups. It is propagated by division of the roots, which are naturalized in many places. Basil is raised from the seeds like sage, etc.

PARSLEY is in demand not only for flavoring, but for ornamenting or garnishing dishes; the leaves of the finer kinds being really beautiful. The seeds are very slow in starting—often remaining several weeks in the ground, and when transplanted are slow in recovering. Thin seedlings or transplant to eight inches apart. Provide enough plants to allow some to be kept in a box, to afford leaves during the winter. In sowing seeds of winter cabbages, do not forget to try some of the Savoys, recommended last month, page 101. Brussels Sprouts, another variety of the cabbage, with small heads along the whole length of a tall "stump" or stalk is as easily raised as common cabbages. This is seldom raised in the market gardens.

An Old Dwelling Improved.

Mr. Jas. H. Rogers sends us a rough draft of his dwelling as it was and is now, and writes: "The old roof needed re-shingling, and while doing this

Fig. 1.—THE OLD HOUSE.

it was projected over the sides and ends, and a simple cornice added at small cost. The other changes are two windows in the gable instead of one; a small porch added in front, and a bay window with glass panels (not shown), was placed in the back

Fig. 2.—AFTER THE IMPROVEMENTS.

wing, which changed the dismal and cheerless sitting or family room, into the most pleasant room in the house, and greatly improved the exterior.

Practical Poultry Suggestions.

Many suggestions for the care and management of poultry intended as helps to beginners, are liable to mislead those with little experience, who should be cautious in trying all new methods presented. When recommended to use strong mixtures, like oil of sassafras, turpentine, kerosene, etc., on the chickens to kill the lice, avoid doing so unless desiring to kill the chickens as well. Sprinkling sulphur freely about their coops, and on their bodies, is a milder and quite as effective remedy. The best possible plan is not to allow lice to get a start, by keeping the premises thoroughly clean, and the buildings well white-washed. I have read that at the time parsley is abundant in the garden, it should be given to the fowls as a green food. It is not well, however, for it is likely to cause a looseness of the bowels, and dropping of soft-shelled eggs under the roosts. Allow the fowls access to tender grass a few minutes in each day, and give the parsley to the pig. Another suggestion is, to scatter air-slaked lime freely about the houses as an absorbent, and a deodorizer. But the continual motion of the fowls keeps the air filled with the choking lime dust, and soon causes injurious irritation in the air passages. Plaster, or a shovelful of dry soil thrown on the roost board, is better than lime. When fowls have a cold, it is better to use a little care in feeding for a few days, than to dose heavily with pills, red pepper, etc., etc., as some recommend. A cold or roup shows itself in different ways, by coughing or sneezing, and by swelled faces, watery eyes and nostrils, and the worst form is canker in the mouth. A simple cold can be easily managed and cured in a few days, by giving small quantities of sulphur in their warm dough, with a light sprinkling of red pepper occasionally, and warm water to drink. Castor oil, applied by pouring it down the throat from a small-necked bottle, is particularly good. In cases of canker, which is the worst form of cold or roup, more care is necessary. The diseased fowl must be immediately removed from the well ones, and pure water provided for them in clean dishes, in which a small piece of copperas may be dropped occasionally. Feed no hard grain, and mix the

dough with hot milk, feeding it sparingly. I have before now advised those keeping poultry to raise a crop of mangels as vegetable food for laying hens in winter. Failing to raise a crop myself the past season, and not being able to find any, I procured a quantity of cow-horn turnips, hoping they would take the place of the mangels, but they do not satisfactorily, and I still say, for a winter green-food for fowls, nothing equals the beets. They keep well, and when cut open and placed in the feed boxes, the fowls will pick greedily at them as long as they last. If fowls do not have access to hay in the winter, it should not be given to them whole and dry, for if eaten in quantities it will obstruct the free passage of food through the crop, and they will become crop-bound. The early clippings of the lawn should be saved, and steamed with hot water, which will make it very good for fowls, and quite digestible. H. C. B.

The Drag.

Wherever introduced the drag is taking the place of the roller. In almost every way it does better work. If the ground is uneven the roller will not smooth it; the drag will. If the clods are hard and dry, and the rest of the ground loose, the roller will often simply push them down without crushing them; the drag grinds them fine. If the lumps are wet, the roller will be likely to press them into a solid mass, and while the drag will often tear them to pieces, leaves them loose to be dried by the sun and air. Figure 1 is the best form of drag, made of oak planks two inches thick, and about a foot or fourteen inches wide. If for four horses, the planks can be about twenty feet long; if for only two horses, ten or twelve feet long. These are bolted firmly together, overlapping about two inches, as shown. About two feet from each end of the front plank, a strap clevis is fixed to receive the double-tree, and a team is hitched to each, the driver standing on the drag behind. If the driver's weight is not enough, stones or logs may be added. For a two-horse drag, a hole is bored in the front plank about two feet on each

Fig. 1.—A PLANK DRAG.

side of its center, and a chain is then passed through these holes, connected with a clevis in front, to which the double-tree is attached.

Figure 2 shows another form, made of two logs, about a foot in diameter, and sixteen or eighteen feet long. Three cross-pieces are let into the logs, and pinned or bolted to hold them about one foot apart. A stout iron rod with hook in front for the double-tree, and a screw nut in the rear, fits a hole bored about two feet from each end of

Fig. 2.—A LOG DRAG.

the front log. This drag does not do quite so good work as the plank one, as there are no sharp edges to cut the clods, and it is more unwieldy; but it is quickly constructed from material always at hand, and for this reason is often made in preference to the other.

Milking Tubes.

An unusual number of inquiries about milking tubes have been received recently. Several years ago they were brought before the public, by a man who had some notoriety as a practical farmer and stock breeder, with a great flourish as convenient, practical and useful in any herd, and not injurious. No doubt at first he may have been honest about

it, but he really tested only one or two of his own cows, and the only one we saw thus used had her udder ruined. Still the boom went on in spite of the warnings of this journal, and other editors, who took care to let their readers know what the matter was as soon as they learned it themselves. A dozen different forms were made, and some were patented, but all were worthless except in the hands of a skillful surgeon, and then in case of obstructions.

At times the insertion of a tube into the teat of the cow will empty the quarter rapidly of the milk, without harm to the cow. But there is one danger always present: on withdrawing the tube a bubble of air is very likely to escape from it into the udder, and there being no provision for absorbing of air thus introduced, it acts like any other foreign substance, and produces inflammation—garget, often most intense. All the efforts to prevent the escape of the air bubbles by bending the tubes, by attaching rubber tubes, and various other contrivances were in vain. Hundreds of cows had the garget and lost one or more quarters. Our advice given then and repeated now is, let milking tubes alone. They are no longer on sale that we know of, and ought not to be. It is important for a physician or surgeon to be able to draw off milk without pressure upon the teat or udder, but other people better be content to follow the old way in milking.

Animal Ailments.

PROF. D. D. SLADE, HARVARD UNIVERSITY.

AN IMPOVERISHED CALF.—"A. A. W." writes from Slocumville, R. I.: "I have a calf dropped last August, weaned and turned out to grass in September, and cropped as well as any animal; eats any kind of fodder or grain, has some oil-meal every day, but is poor as a crow. Has a good appetite, is not lousy I think; still I have treated her for lice. What can I do to make her lay on some flesh?"—It is hardly possible that lice are numerous enough to affect the health and escape even the most superficial examination. Parasites of every description abound more especially on animals reduced in health and strength, and suffering from poverty and neglect. Under such circumstances lice are the effect, not the cause. Strict cleanliness, warm, dry, sunny well-ventilated quarters, thorough rubbing and brushing of the skin daily to stimulate the circulation, attention to the state of the bowels, are necessary factors in bringing about a better condition. Hasty pudding and milk given warm twice a day is a nourishing food. Sweet clover hay, or good rowen, with a few carrots cut fine, are essential.—The animal in question needs a change of diet, and whatever this may be, if appropriate and sufficient, with attention to the other points described, will soon result satisfactorily.

DISTEMPER IN DOGS.—"C. M. W.," Star City, Ind., writes: "What is good to give my dog, and what disease has he? He seems to be always chilled, and matter fills his eyes; breath very bad; breathing very heavy. I think he has distemper."—These are among the common symptoms of canine distemper, and our correspondent is probably right in his diagnosis. As the tendency in this disease is toward debility and emaciation, all depleting remedies should be avoided. Almost all parts of the body may become implicated, but the respiratory and digestive organs are most frequently attacked. The treatment must be directed towards the various complications that may arise. Under all circumstances the general treatment is obvious. The dog should have dry, warm, well aired quarters, and his food milk with bread, or milk porridge. Cooked meat may be given according to circumstances. A gentle laxative of half an ounce of castor oil may be given, followed the next day if necessary, by three grains of ipecac twice a day until the breathing becomes better. Afterwards as tonics twelve grains of gentian or three grains of sulphate of iron should be given with the food three times a day, and the diet may be more stimulating and generally richer as he improves.

STUNTED COLT.—"L. H.," Lancaster, Mass., describes a colt of thirty months as small and of slow

growth. "At present she eats well, has good hay, oats and bran mixed and wet with rain water once a day. Last summer the coat was not shed, except as it wore off. The dam was loaned when with foal, worked and starved nearly to death. I suppose this is part of the trouble. I have given alteratives and various combinations with but poor results."—The animal inherits the consequences of the bad treatment of the dam during pregnancy. "Like produces like." This fact is shown particularly in the feeble powers of the skin, its inability to shed the hair; and again in the impoverished condition of the system generally, the result of improper and deficient nutrition. Patience may be rewarded in this case by better results than can now be anticipated. Supply the most nutritious diet possible, especially one in which carrots is a daily portion of the diet. Daily rub the skin thoroughly with the brush. Supply warm, sunny quarters, with opportunity for exercise in a sheltered yard. In short, do everything that may maintain the best state of health. If no improvement appears after several months of the above treatment, then possibly purgatives may be given to stimulate the digestive powers, but with this exception, it is best to avoid using drugs and "condition powders."

SWOLLEN LEG.—"N. D. H.," Raymond, Nebraska, writes that he has a mare whose leg is swollen and was in this condition at time of purchase. "She does not limp; and the swelling goes down some when she travels, and is at its largest when she is standing idle."—Swelled legs indicate imperfect circulation in the parts, and are due to a stagnation of their fluids. This condition is often the result of constitutional debility, and may be inherited. It is frequently brought on by irregular exercise, at one time excessive and then a period of idleness. It is often impossible to ascertain the exciting cause, especially when the animal is otherwise in good health. The treatment should consist of thorough grooming of the entire body, of hand rubbing of the affected limb, followed by the proper application of a flannel bandage, worn constantly when not at work, and this should be regular and not excessive. If necessary, mild diuretics, or physic, may be combined with the above treatment, but avoid these if possible.

CRACKED HEELS.—"S. C.," Milton, Pa., states the following case: "A mare six years old, well bred, free driver, cracks come in the usual place of 'scratches,' are not always sore. The scars do not go away. After a hard day's drive these places seem feverish and she walks stiff next morning. Bran mashes for a few days afford relief. Have exhausted all kinds of external remedies. Owned her a year and a half, and she is better than when I bought her. Is kept in a box stall, eats well, is well groomed, has a good coat, and is in fine spirits."—The cracks are but an aggravated form of the disease known as Scratches, which is an inflammation of the heels, and due to both local and constitutional causes. The former are long exposure to wet and cold, washing the parts with caustic soaps and neglecting to dry them thoroughly; putting the animal into stall without attention to the parts after long and fatiguing exercise and exposing the heels to cold draughts of air. The constitutional causes are shown by the imperfect circulation, and consequent swelling of limb, and want of activity in the vessels of the heels. This condition is often found in debilitated horses, and also in others apparently in good condition, but whose skin is particularly sensitive to external irritation. The treatment must be both general and local. Attention to the maintenance of the health by proper nutrition, cleanliness of the skin, regular exercise, etc., are all of the first importance. Tonics such as iodide of iron, gentian, etc., are necessary if there is debility. Green food in the form of roots, especially carrots, with occasional bran mashes, serve as gentle laxatives. For local treatment, if the cracks are deep, and the parts stiff and sore, apply a poultice, upon the surface of which may be sprinkled a lotion of sugar of lead. Afterwards put into the cracks the benzoated oxide of zinc ointment, carefully, twice a day. A

well-applied bandage from the foot upwards will assist the cure by its moderate pressure. Removing the hair about the heels is often followed by bad cracks; so clipping the legs is inadmissible.

DISTORTED HORNS.—"A. T. N.," of Franklin, N. Y., writes: "We have a grade Jersey cow nearly four years old, which was stabled in a narrow horse stall when a yearling. I fed her hay in one stall and roots in another, once a day. As she turned to change stalls her stub horns rubbed along the sides and they have grown lopped down towards her nose, pointing inwards. I commenced rasping the right one (which turned nearly at right angles with the head). It was then about a quarter of an inch from the side of the face. Rasping it from time to time did not change its twist. When it got within an eighth of an inch from the face I sawed off about two inches, as there is danger in sawing off more. What shall I do?"—Though the form of horn in the several breeds follow general laws, assuming different shapes according to the breed and sex, it occasionally happens that from some unexplained cause, an unusual shape is developed. It is not probable that the supposed cause (in the above case) had anything to do with the twist, and the owner can rest well as-

under the nuts, which stopped their working loose. If at work in a field where you can not place the jug of drinking water in the shade set it in the furrow, throw a bunch of grass over the mouth to keep it clean, and plow the jug under. The ground will shield it from the hot sun, and being cool and damp will help keep the water cool. In plowing, to keep dirt out of the shoes, take the legs of an old pair of trousers and cut off pieces about a foot long. At opposite points of each sew two strings. Draw the pieces on over the shoes, tie the strings down underneath just in front of the heel. Then fasten the upper ends of the pieces around above the ankles with elastic garters. For a marker to lay off corn rows among stumps, put two wagon wheels on an axle of a length to keep the wheels just the distance apart the rows are desired. Any stout stick of wood will do for the axle. Fix on a seat to ride if desired. This marker will pass over ordinary stumps, and can be easily turned to avoid those directly in the way of a wheel. J. S.

Lincoln Sheep.

The popularity of the breed of sheep—of which we present an engraving, representing a group of

A GROUP OF PRIZE LINCOLN LAMBS.—Engraved after the *Agricultural Gazette*, London.

sured that nature will be perfectly competent to manage this without any interference by any one.

Helpful Hints.

When oats or other feed get low in the granary, instead of straining to reach them nail a stout strip to a bucket or box with which they can be easily lifted. A horse of mine takes especial delight in rolling in mud or manure. I tie an old broom-stick to the curry-comb and stand off at a clean and safe distance until I get the worst of it removed. If in plowing the land-side horse is a lazy one and crowds over against the one in the furrows, take an inch board about six inches square, and through a hole in the center drive a wooden pin sharpened at one end. Tie this to the back-band of the furrow horse so that the lazy one will strike it every time he crowds, and he will soon get tired of doing so. Always have on hand a paper of copper rivets of assorted sizes and a piece of oiled leather for cutting strings to keep the harness mended with; then breaks can be readily mended, or those threatened in tugs, lines, straps, etc., either by rivetting or sewing with the stout leather string. When a calf persists in sucking after being separated from its dam for several weeks, take an old halter and through the strap passing around in front of the nose put nails, having the points filed sharp and standing outward. A piece of leather sewed over the heads keeps the nails in place. With this halter on the calf the cow will kick and keep it at a distance and it will soon give up in disgust. Formerly I was often annoyed and delayed by the loosening of nuts on coulters or rolling cutter, until I hit upon the plan of putting leather washers

lambs, comprising a first prize pen at the late Smithfield fat cattle show—has been on the increase in this country ever since its first introduction. The Sheep of Lincolnshire were heavy-carcased and leggy, but carried very long fleeces. They were greatly benefited by crosses with the Leicesters as improved by Mr. Bakewell, and known as "Dishley's," from the name of his place. Still the Lincolns retained characteristics of their own which render them quite distinct from other long-wool breeds of the present day. They show this both in the wool and in the carcass, and have been greatly improved by judicious breeding in recent years. They are regarded by their breeders in this country as hardy, hearty feeders, heavy, well-shaped, and peculiarly well and long-wooled. In each of these particulars they have been improved and are in all respects a noble and excellent breed for early lambs, for mutton, and for fleece. A recent writer attributes some of their peculiar excellencies to an importation of big Dutch long-wool sheep said to have been made about one hundred and fifty years ago into Lincolnshire. It is not at all improbable that such an importation was made, as size, and length of fleece were qualities then more highly prized than compactness of carcass. Mr. Bakewell, who so improved the Leicesters that he may almost be said to have created the breed as we now know it, paid little attention to the fleece, and neglected mere size in preference to form and quality. What blood the Lincolns possess which responds so kindly to good breeding practices and careful selection is not certainly known, but it is a fact that it is in the blood and that selection alone would not so promptly fix the valuable peculiarities of fleece and carcass which they now possess.

Poultry House in Sections.

A. WOOD, R. I.

The Poultry House, shown in figures 1, 2 and 3, is designed to have a central building, with as

Fig. 1.—FRONT OF POULTRY HOUSE.

many sections added on each side as may be required by the wants and circumstances of the owner. The estimates given below show that the central building will cost \$59.97, and each added section, \$33.72. As indicated in figures 1 and 2, the glass fronts of the sections lean back at the top, and the front roof follows the same angle, the sash sliding up between the rafters.—The main room, twelve feet square, with eight-foot posts, is for storing and preparing food, etc., dressing poultry, packing eggs, and may contain an incubator. One section might be kept for a hatching room. The house and sections should face the south or south-east, and its rear be against or into a bank when practicable. The elevation shows brick underpinning; stone would be cheaper in some localities, as would be plain matched pine or plain boards and battens, instead of clapboards.—Cheaper ventilators may be provided, but looks are worth a little.—There is a platform under the roosts, from which the droppings are collected in the alleyway, and this should be done daily in winter. The partitions between the alley and the roosting room are of two inch slats. The roosts should be hinged and hook up for convenience in cleaning. The flooring of the sections is of fine gravel. Water can be conveniently supplied to the entire range by an inch pipe, with a place on each section, two feet

Fig. 2.—END VIEW OF POULTRY HOUSE.

long and four inches in diameter, open at the top as a drinking trough; the water to be regulated by a floating valve in the supply tank.—The houses can be warmed by hot-air pipes from the main building, sunk in the gravel. The water supply pipe, if laid along these, will be kept from freezing.

There should be connected with each section a yard of the same width (ten feet) and fifty feet long. The cost of each yard would be about thirteen dollars and thirty-nine cents; that is, thirteen posts, at ten cents; one hundred and forty-six feet of two by four inch joists, two dollars and thirty-four cents; three hundred and twenty-five feet of two inch slats, eight feet long, six dollars and a half; nails and labor, three dollars and a quarter. There ought not to be over fifteen fowls in each section, and they would do better with only eight in a section. The estimate for a section and its yard is forty-seven dollars and eleven cents, or with paint, say fifty dollars. Ten per cent. on this, or five dollars per annum, would be fifty cents a year each if only ten fowls be kept in a section, adding pro rata for the expense of the central building. Any experienced poultry raiser will readily admit that the product of fowls thus kept separate, with abundant yard room, would be far greater than the cost.

Estimate for the Main or Central Building.

TIMBER: 109 feet of 4 by 4 inch, for sills and posts;	
120 feet of 2 by 6 inch for floor, joists and plates; 136	
feet of 3 by 4 inch for studs, girts, etc.; total, 365 feet	
spruce @ \$16 per M.....	\$5.84
175 feet spruce flooring, \$3.85; 240 feet hemlock roof-	
ing, \$3.36; 500 feet matched pine, \$12.50; 2,500 shingles	
@ \$3.25 per M., \$8.12.....	27.83
3 1/2 cords stone work, \$3.50; 1 foot 8 inch cement stone	
chimney top and pipe complete, \$5.80.....	9.30
2 windows, \$4.00; 1 door, \$2; 2 hinges, \$1.....	7.00
Carpenter work and nails.....	10.00
Total, (without painting).....	\$59.97

Fig. 3.—GROUND PLAN OF POULTRY HOUSE.

Estimate for Each Section.

40 feet of 4 by 4 inch for sills; 4 rafters 2 by 6 inch by	
11 feet, and 4 by 9 feet for front (80 feet); 46 feet of	
3 by 4 inch studding and girts. Total, 176 feet spruce	
timber @ \$16 per M.....	\$2.82
140 feet hemlock roofing boards.....	1.96
1,500 shingles @ \$3.25 per M.....	4.87
50 feet roost slats, \$1.00; 1 pair hinges, 50c.....	1.50
3 sash @ \$2.25, \$6.75; ventilator, \$5.00.....	11.75
4 cords of stone work, @ \$1.00.....	4.00
Carpenter work and nails.....	7.00
Total, per section, (without paint).....	\$33.90

Errors and Facts in Meteorology.

The communication (January *American Agriculturist*, p. 12) entitled "Do Trees Increase Rain-fall?" contains some valuable arguments, but some of its teaching is likely to give wrong impressions. A supposed wind is referred to as passing from the Atlantic westward, and crossing the Rocky Mountains. It is well known to all students of meteorology that no wind at our latitude blowing from the Atlantic passes over those mountains. Storm centers, or areas of low barometer, within the United States almost universally travel eastward, tending to the north, rarely going to the south and never to the west. No trade winds pass westward over the United States. All other winds flow to areas of low barometer to feed the updraft. A low barometer in Ohio draws to its center, with a spiral motion, air from all sides, and its influence is often so great as to affect by its indraft the air on the Atlantic coast; but, a low center over or west of the Rocky Mountains can never exert sufficient power to carry any air from the Atlantic so far westward. Suppose his proposition possible. Then the moist air from the Atlantic, but partially robbed of its moisture by the Alleghenies, after crossing the Mississippi, would be elevated; this elevation would reduce its temperature, and therefore its absorptive power, thus causing part of its moisture to fall as rain on Western Kansas and

Eastern Colorado, and removing the aridity of that region, just as the Gulf winds passing up the Ohio Valley deposit their moisture on the western slope of the Alleghenies, thereby producing the great floods of which we often have an illustration.

The facts are as follows: Winds of the Pacific are by the coast range elevated, cooled, and robbed of much of their moisture; they then pass over the great basin in an absorptive condition, taking up moisture; hence the aridity of the region of Salt Lake. Again more highly elevated in passing up over the Rockies, with reduction of temperature, they become rain producers on their western face. After crossing the crest they are lowered in position, with increased temperature, and become absorptive winds, taking up much moisture from the eastern part of Colorado and from Western Kansas. Passing eastward toward the Mississippi Valley, they come in contact with the warm, moist Gulf winds, reducing the absorptive power of the latter (the mingling of the two often producing cyclones); their excess of moisture is deposited, and continues to be progressively deposited as the mingled air is elevated in passing up the west flank of the Alleghenies. East of these mountains there is no arid region like that east of the Rockies, merely because of its proximity to the Atlantic ocean, and of the Gulf storms passing northeast parallel to the coast.

S. HUSTON.

One Currant Bush.

Have you, farmer, or any one else who has the land, an abundance of currants? There should be on every farm at least a sufficient number of bushes to afford all the currants the family can use, and if one resides near a town or village it will be well to have a few more to carry to market.—"Can't bother with picking currants," do you say? The girls will pick them, and you can take them, and mind, don't forget to bring the girls the money for which they sold. But before selling a currant, there should be an abundant supply for the family, not only through the fruiting season but through the winter. The fresh fruit is most ac-

ceptable and refreshing; it is true that its acidity needs to be modified by sugar, but sugar is food, and it is cheaper to buy sugar than medicines, and sugared currants are healthful. For the winter, currants may be canned and made into jelly, easily the best of all jellies. A dozen bushes, when in full bearing, will yield currants enough for a family of moderate size. If fruit is to be marketed, two or three dozen or even a hundred bushes will be needed. Don't set a few bushes and leave to the family the fruit that is not marketed. Currant bushes can be bought for about fifty cents a dozen. If even this moderate outlay is not convenient, a single bush can be bought for ten cents, or if sent by mail for fifteen cents, and with one bush there is hardly any limit to the number that may be raised from it in a few years. In behalf of the family and future possible profit we say, get one currant bush, at least, and as many more as can be afforded. As to kinds, the Versailles for red, and White Grape for white, are standard varieties; there are other and more costly kinds. If both cannot be planted take red instead of white. The bushes, few or many, should be planted in good soil, not against a fence as we often see them, but where they will have air and light, and where one can go all around to cultivate them and to pick the fruit. Set the bushes five feet apart in rich garden soil, and at the approach of warm weather cover the soil over the roots with straw or other mulch. As dealers differ in their treatment of the bushes before they send them out, it is difficult to say whether they should be pruned at planting or not. If the bushes do not appear to have been trimmed it will be well to cut away from one half to two thirds of the stems. If blossoms appear, it will be better for the future of the bush to pick them off. How to make many bushes of one and what to do with the bushes after they have made a season's growth, will be attended to at the proper time. Our present object is to have a beginning made.

Swarming, and How to Manage It.

W. Z. HUTCHINSON.

We often hear the remark, "As soon as my bees became strong in numbers, and were working nicely in the boxes, they swarmed, and away went all prospects of a honey crop."—This inclination to swarm is with many the chief obstacle to producing comb honey. A few years ago non-swarming hives were loudly praised (by their vendors); at present, such nonsense would fall on deaf ears.—In producing extracted honey, swarming can practically be prevented; but in an apiary run for comb honey, it never has been prevented, probably never will be, and, if rightly managed, is not undesirable. One good method of swarming is the following:

By shading and ventilating the hives, and supplying plenty of room in the surplus department, swarming will usually be retarded until the colonies have stored considerable honey in the hives and are populous enough to send out large swarms, and a few colonies will not swarm at all. When a swarm issues, set the parent hive to one side, and place on the old stand a new hive having its frames filled with wired foundation. Then cover the new hive with a queen-excluding honey-board, setting the boxes taken from the old hive upon the new one; shake the clustered swarm into a basket, cover with a cloth, carry it to the new hive and shake them down in front of it. The bees will readily enter, and, in less than half an hour, they will again be at work in the same boxes they so recently and hastily deserted, and with that energy so characteristic of a new swarm. It is a great mistake to wait even twenty-four hours before giving boxes to a newly-hived swarm.—As soon as they have fairly settled down to business, in half an hour perhaps, place the old hive back alongside the new one, the rear ends nearly touching, but with the front of the old hive turned to one side at an angle of say forty-five degrees. All the bees out foraging when the swarm issued, and all afterwards leaving the old hive, will return to the old location and enter the new hive, thus "booming" the new swarm already working in the boxes. By turning the old hive a few inches daily, it can in three or four days be brought parallel with and close to the new one. The bees of each hive will thereafter recognize and enter their own homes. These two hives practically occupy the same stand, and if either were removed during their absence, the returning bees would enter the one remaining.

In the old hive the bees are hatching daily by the thousands, and in about eight days after the first swarm issued—when the young queens usually begin to hatch—the probabilities are that the old hive, if undisturbed, will send out another swarm. This is undesirable, and is prevented by removing the old hive to a new stand, two or three rods distant, on about the sixth or seventh day from the first swarming. All the flying bees belonging to it—enough to make quite a little swarm—on returning to the old location, enter the new hive, thus giving its colony another boom, and so reducing the numbers in the old hive that swarming is abandoned, and the young queens are allowed to fight it out for the "survival of the fittest." In about three weeks after the old hive first swarmed its young queen will commence laying, when, if the honey flow continues, it should be given a case of sections. With this management there is no opening of hives, no hunting for and cutting out of queen cells, no fussing or bother. In the writer's experience, only about one colony in twenty-five has east an after swarm; none of the first or prime swarms have swarmed; and the amount of surplus honey obtained has been greater than from colonies that have not swarmed.—A second or after swarm can

be hived upon frames of wired foundations, and the hive placed by the side of the old one; and as soon as the queen is fecundated and laying, the entire swarm can be shaken down in front of the old hive, and the drawn-out frames of foundation be set away for future use. If a third swarm should issue, it can be treated in the same manner as described above, by placing it upon the opposite side of the parent stock.

In the writer's apiary two large tin pails filled with water are always kept near the shop door, with a fountain pump hanging over them; and if a swarm shows any disposition to leave, or is slow in clustering when other swarms are expected, it receives such a sprinkling that it soon "hangs itself up to dry." With such a pump and plenty of water it is next to impossible for a swarm to abscond. The implement is also useful to prevent uniting or clustering of swarms issuing at the same time. Near the tin pails stand two splint clothes baskets, lined with cotton cloth, and each basket is furnished with a burlap cover stitched to one side of it. As soon as a swarm has clustered it is shaken into one of these baskets, the cover flopped over, and if another swarm or something else demands immediate attention the basket and its contents can be set one side, to be disposed of at leisure.

After seeing the ease with which bees can be managed when allowed to swarm naturally, the energy with which they work, and the excellent results obtained, the writer is decidedly opposed to artificial swarming—and also to queens with clipped wings. In the first place, when the bees swarm, the queen has to be found and caged. The bees roam around a long time, and sometimes finally cluster. If another swarm comes out they are certain to unite with it. When the bees do return they often go piling into the wrong hive, perhaps hives; and if they do catch on to the proper one, instead of going in they often cluster all over its outside. Sometimes, after the queen has been allowed to run in she comes out again then of course the bees will follow her. In my experience a swarm having an unclipped queen can be hived and be at work in that "whooping," "zip-ping," go-ahead style, in just about the same time that it takes a swarm with a clipped queen to make up its mind, sullenly and doggedly, to go back home.

Bracing Fence and Other Posts.

Much of the efficiency of all wire fences depends upon having the corner posts, and others at frequent intervals, firmly braced against sagging. A large strong post to be deeply set is not always available, and is generally unsightly by comparison with others. Various devices have been given, many of them depending upon stones, but these

A CORNER POST BRACED.

are seldom available, on the prairies especially. Mr. A. C. Gable, Yorkville, Ill., sends us the following method, applicable to single posts, corner posts and to clothes-line supports. For the latter purpose Mr. G. says he erected two posts twelve yards apart, and though in constant use for six years, they are erect as ever. A little below the ground surface, on the side of the strain, a piece of durable board or plank, half a foot wide, and three to four feet long is spiked on to the post at right

angles; and another piece about half as large is spiked on the opposite side near the foot of the post. When the ground is well packed around these they will hold very firmly. The size, width, thickness, and the depth in the ground, will depend upon the lightness or compactness of the soil, and the amount of strain to be resisted. The sketch shows two sets of these braces for a corner post. For single posts in line, and clothes-line posts having a strain in only one direction, a single pair of cross pieces is needed. These may be of plank, strong boards, or short pieces cut from rails or old posts, and flattened to fit the sides of the upright.

Latch for Barn Door on Hinges.

A wooden bolt, *a*, slides freely through the notch in *d*, and into a notch in the upright post behind the weather boarding which holds it. On the other end a short iron strap is screwed on firmly, with its

A BARN DOOR LATCH.

end held by a screw on which it turns, to the lever, *b*. This lever, *b*, is keyed with a nail or pin over *c*, which is the squared end of the handle, *h*, that comes through the board from the outside of the door. The latch, *a*, is drawn out of its socket by seizing the lower end of *b* on the inside or turning *h* on the outside. The wood for all will need to be tough; the size of the parts to be proportioned to the size of the door.

W. S. S.

Early Amber in California.—Experiment.

The necessity of a drouth-enduring crop adapted to the soil, climate, etc., of central and southern California, has led to considerable experimental farming of varied degrees of success, including the introduction of Alfalfa, Egyptian Corn, and other equally valuable crops. Probably nothing yet has so nearly filled the demand, with the small farmer at least, as the sorghum canes. Of these, the Early Amber and the Black Top seem to be the most noteworthy, owing to their peculiar adaptability to the methods of cultivation here practised. Below are the precise figures on an experimental crop of two acres in Fresno county, the very centre of the State. The results are all given per acre, and while accurate, the expenses are much in excess of what are really necessary; and the amount realized is smaller than need be, owing to the inexperience of the planters, the use of defective machinery, and the small area worked. The seed was planted in May and harvested Nov. 1.

Irrigating water before planting.....	\$1.00
Man to tend water half day.....	.75
Man with team and tools one day.....	2.50
Man planting seed, one day.....	1.50

Cost for planting, \$ 5.75

Cutting and hauling.....	\$ 2.50
Rent of mill.....	2.00
Man and horse, one day.....	2.00
Man to superintend.....	2.50
Wood used in boiling.....	1.75
Casks for syrup.....	5.25
Hauling to house.....	1.00

Cost of manufacture..... \$17.00

Total cost.....\$22.75

The yield was one hundred gallons of good quality syrup, worthy seventy-five cents per gallon, or seventy-five dollars per acre, leaving a net profit of fifty-two dollars and twenty-five cents per acre, a pretty fair return on land valued at thirty dollars per acre. The crop was considered a fair one, and

although not receiving a drop of water from rain or irrigation after planting, the stalks averaged seven-and-a-half feet high, one and one-eighth inch diameter at the butt, and weighed something over two pounds each. No cultivation whatever was bestowed after planting, and no suckering done, and of course the yield of syrup was correspondingly low. It should be borne in mind, that full wages are allowed for all hands employed, while in fact the labor was all done by the farm men when other work was slack, and with comparatively no expense except for vessels to hold the product. This is not a fair test of the capabilities of this soil and climate as a sorghum producing region, for had the season been a favorable one, the raising and manufacture on a more extended scale, with better machinery used, and due care exercised in the selection of cane for crushing, the result would no doubt have been much more satisfactory.

The Culture of Figs in California.

T. S. PRICE, SELMA, CAL.

When we read in 1879 that the importation of figs into the United States amounted to nearly half a million dollars annually, we were surprised that a country, the greater part of which is so well adapted to its culture, should act as consumer of a foreign article, when it might with profit meet all the demand for home consumption. While nearly all the southern and southwestern sections of the United States have the soil, climate, and other requirements for raising and maturing the fruit, it is doubtful if any other section has more nearly all the peculiarities for entire success than has the southern half of California. Probably in no other place will the effort of the horticulturist to produce figs be so liberally rewarded.

Several varieties of figs are cultivated here with considerable success, but the White Ischian and Dark Purple fig seem thus far to be the most profitable. Owing to the great interest in raisin and wine production the past few years, very little attention has been paid to figs, further than to supply the immediate wants of the culturist; however, within the past two years considerable interest has been manifested in the production of an article fit for shipment. The fig is propagated entirely from cuttings, which in suitable soil make a very thrifty growth. The soil in which it seems to thrive best is the black alluvial soil of the foot-hills, although it makes nearly as good a growth on the plains below. Very little pruning is necessary, in fact it is a mooted question whether it is of any advantage to prune, further than to prevent stoolsprouts; and in general, less attention is necessary to its well-being than must be given to other fruits. Experience has demonstrated the fact that the tree is more productive, and yields a better quality of fruit when allowed to branch near the ground, thereby shading the roots, and at the same time, being more convenient for gathering the fruit. Under favorable circumstances the fig often fruits here the same year of planting, while the second season frequently furnishes a fair yield; but the best results as to quality and quantity can only be hoped for after the eighth or tenth year. From some cause, whether from lack of proper fecundation or otherwise, the first crop is of little or no account, often falling before maturity. The second crop is the principal one, while the third is often of considerable consequence. The things particularly lacking to secure the fullest measure of success are easy and rapid methods of gathering the figs, and proper instruction as to the best methods of preparing them for market. So little has been done toward the preparation of an article of export, that those who might, have not informed themselves in that direction as they should have done. Some parties here have indeed "put up" some of the fruit in a very creditable shape, but the expense connected with the preparation has infringed greatly on the margin of profit. As a preserved fruit, the fig has certainly equaled our most sanguine expectations; as a dried fruit, the demand is a certain mark of its appreciation. The

common method of drying as used by the farmer, is the same as that for sun-dried peaches. The product is usually hard and unpalatable when raw, but of excellent taste when cooked. Dried in the shade and on the ground, the taste is preserved to better advantage, but requires more care and expense. When the same care is exercised in their preparation as in Italy and in Spain, and when they become better known, our figs will hold a high place in the markets of the world. A tree of eight or ten years old should yield from four hundred to six hundred pounds of well-matured fruit annually.

The Eatable-Podded Peas.

There is a class of peas quite different from the kinds usually cultivated; the pods, instead of the tough, parchment-like lining, become tender and succulent, and when bent they snap suddenly like string beans, and they are used in the same manner. There are a dozen or more varieties in this class, but our seedsmen rarely offer more than two or three. They do not seem to be much cultivated in this country, though the few who try them esteem them highly. The pods are usually very large and irregularly curved, as shown in the engraving of

THE RAM'S-HORN "STRING PEAS" (NATURAL SIZE).

the "Ram's-Horn," a variety largely cultivated in France, a country in which these peas are much more generally esteemed than with us. As with common peas, there are dwarf and tall kinds, and they require no different cultivation from that given to other peas. When the pods are in proper condition, they will break with a clear fracture; if allowed to become too old, they will be tough and not desirable. They are by some called "Sugar Peas," "String Peas," and also "Skinless Peas."

"The Louisiana Purchase."

H. A. HAIGH.

Referring to the "Public Domain" article (p. 5, Jan.), Mr. B. F. Taber, Orange City, Fla., asks if the U. S. Government has perfected its title to the "Louisiana Purchase," by cancelling the "obligations" it assumed in addition to the \$15,000,000 cash paid. As stated on p. 5, Louisiana then embraced all the present States of Louisiana, Arkansas, Missouri, Iowa, Nebraska, Kansas, Oregon, part of Alabama, Mississippi, and Minnesota, and the territories of Dakota, Montana, Idaho, Washington, and the Indian Territory south of Missouri. The "obligations" assumed by the United States were specially set forth and their payment definitely provided for in a Convention between the two powers, signed contemporaneously with the treaty (April 30, 1803), and virtually a part of it. They embraced only debts due or claimed to be due prior to that date, from France to citizens of the United States, for supplies, embargoes, and prizes at sea, etc. In brief, the United States merely took the place of the French Government in respect to certain previous claims, by our own citizens against it, the total amount not to exceed \$3,750,000. They were to be paid on orders of the American Minister to France, based on determinations of a joint French and American Commission, with final approval of the French Minister of Finance; the payments to be made from the United States Treasury, with interest. Up to June 30, 1880, (Ex. Doc. 47: 46th Congress) \$3,738,268.98 had been paid, which probably covered about all due. These could in no way affect the title to the lands, which passed the moment the treaty was ratified, (Oct. 19, 1803); and possession was formally surrendered by the French at the city of New Orleans, December 20, 1803, when the American flag was raised. The claims if not paid were no lien upon the land; their non-payment would only have been a breach of good faith by our own Government to its own citizens. Spain made certain claims upon some of the lands included in the "Louisiana Purchase," about the time of the negotiations; but the matter was amicably adjusted November 30, 1803, twenty days prior to our final possession, by a formal delivery of the Province of Louisiana from Spain to France; and the Spanish Secretary of State subsequently made a formal re-nouncement in behalf of the King, as "a new proof of his benevolence and friendship for the United States." Thus the claim of Spain, based on the discovery of De Soto in 1541, was, after nearly three hundred years, abandoned; and the great Valley of the Mississippi and the great Northwest, extending to the headwaters of the Missouri, and on to Puget Sound and the Pacific Ocean, was added to the United States. As a matter of interest it may be stated, that at the time of the Cession, Bonaparte said he only parted with the Province because compelled to do so by the many combinations against him, for he believed that "whatever Nation held the Valley of the Mississippi would eventually be the most powerful on earth"—a prediction already realized, or soon to be.

Saving the Road Wash.

Every road not on a dead level has more or less debris which has a fertilizing value washed off upon its side. The water itself is valuable, and will make grass wherever it spreads. In a hilly country or one of gentle grades, nearly all this water, and the fertilizing matter it carries, may be turned off at frequent intervals upon the adjoining pastures and meadows. The dust and debris of the highway consists of finely pulverized soil and stone, which contains more or less lime, potash, and other valuable material so minutely divided that water makes it immediately available for plant food. Iron and steel tires, horse and ox shoes, and above all the frost, have been at work upon it all through the winter. Appreciable quantities of manure have been dropped upon it by beasts of burden, and their feet have mixed it with the road dust, and made a nice compost. Its value is seen in the rank

growth of grass and briars wherever it lodges. It will pay big wages for all the labor needed to turn this wash off, through culverts or an open ditch, on to the adjoining pastures and mowing land.

Good Nests for Sitting Hens.

The hatching season is approaching, and it is well to be prepared in advance. The sketch herewith, is the most convenient and economical arrangement I have ever tried. A series of boards *b, b, b, b*, about four feet long, and thirteen or fourteen inches wide, are set on edge, fourteen inches apart, as many as nests are wanted, and fastened to *a*, of the same width, with nails or screws. A

NESTS FOR SITTING HENS.

fourteen-inch wide board, *c*, laid over, serves as a cover to the nests *n, n*. The other end has a board, *d*, to close it. Laths over the top confine the hens to the yards thus formed, which are nearly three feet long and fourteen inches wide. The partition boards, *b, b*, secure the hens from each other, and perpendicular pieces *s*, in front of each nest, darken them. Sitting hens usually prefer quiet seclusion, and at least partial darkness. The yards give room for air and a little exercise, and at the far end of these fresh water, always accessible, should be renewed daily, with whole corn for feed. The cover, *c*, can be cut in short sections for convenience, if there are many nests. It may be inclined a little to shed rain. Removing the end screws and the lath, which need to be only slightly tacked on, the whole material can be quickly packed away in small space, and put together in a few minutes another season. They may be set in the poultry house, or outside, according to the weather and season. Hens disposed to sit can be warded to the boxes, by confining them in the nests with the boards *s*, on porcelain nest eggs for a day or two before giving the supply of eggs which are to be hatched out. H. C. B.

More About "Kill-Calf"—Honey.

In January last we gave Mrs. L. Blackman's description of the poisonous effects of a shrub which, on account of these, is called in some localities "Kill-Calf." As there stated, the shrub is *Leucothoe racemosa* of botanists, but does not appear to have had a common name until its bad character caused it to be known in parts of New Jersey as "Kill-Calf." The shrub is found from Massachusetts to the Gulf of Mexico, and as on account of its dangerous character it should be generally known, we gave with the article above referred to, an engraving of the leaves and flowers that will allow it to be recognized. We received a note recently from Mr. A. M. Williams, of Queens Co., N. Y., accusing the shrub of committing other crimes than that of killing calves. Mr. W. says: "Besides the fact that it is poisonous to calves, there is a stronger reason why the plant should be exterminated. The beautiful flowers of the shrub afford the bees a large amount of honey. This honey is very poisonous, and a little of it in a hive spoils all the honey it contains. There are many shrubs more beautiful than this, that are not objectionable, and instead of propagating and planting it for ornament, it should be regarded as a vile weed, and as a greater enemy than the Canada Thistle. In this section, the Kill-Calf is the worst enemy with which we have to contend, it being very difficult to exterminate, and it is hoped that no one will be so unwise as to plant it for ornament."

Teach the Boys to Use Tools.

EBEN E. REXFORD.

Last year a friend of mine, who has three boys, selected a Chest of Tools as a premium for collecting clubs for an agricultural paper, and surprised and delighted the lads with it. They went to work and fitted themselves up a workshop in the loft over the wagon-shed, and there they contrived to spend many an hour pleasantly and profitably. My friend said to me, "I am surprised to see how proficient the boys are becoming in the use of their tools. Why, they have made us many little articles for use about the house and barn, to more than pay for the cost of the tools, if I had bought them for cash, and if they keep on thus, a carpenter will be unnecessary here." This experience can be repeated in any family where there are boys, to the satisfaction and benefit of all concerned. Give the boys a chance to show what they can do. A set of tools will keep them busy on rainy days and odd spells, and out of mischief. Every success will encourage them in larger undertakings, and quite unconsciously they will develop a knowledge of mechanics which will be practical and useful to themselves and others all their lives, and almost every day, the year round, on the farm, about the house, anywhere, and everywhere. The cost of a set of tools good enough for them to experiment with, is small, and cannot be invested to better account. If you can not spare the money, encourage them to get up a club for a paper giving premium chests of tools. If they do not quite succeed, help by contributing a little cash for the difference. The investment will come back before you know it. Most farmers having more expensive tools, do not like to have boys use them for fear of possible damages, and they grow up almost entirely ignorant of saw, and plane, and chisel. Let them have tools of their own, and show them how to take proper care of them. Teach them all you know about them, and set them at little easy jobs. When they do these well, let them know their work is appreciated, and they will become ambitious to do still better work, and take pride in it; so will you, when you come to see that that they are able to do what you have heretofore depended on outside labor for. One of the most convenient things about the house or farm, is a man who can use tools.

Novel Way of Getting Winter Eggs.

A. H. Kepley, Effingham, Ill., writes us: A retired country merchant, in telling us of his experiences thirty and forty years ago, gave this incident worth repeating: One of his customers brought in a full basket of eggs every week all through winter, when few came from any others. On inquiring, it was found that he had warm quarters for his poultry right over the pig pen, which was only high enough for the tallest hog to stand in. The warm air rising from the swine through the crevices, kept the hens so comfortable that they continued laying right on in the coldest weather. Perhaps also the near presence of the pigs may have scared away the night prowling marauders.

Moving Heavy Stones—Lifting Posts.

As the best farm wagons are intended to be, and should be, abundantly strong to support four or

MOVING HEAVY STONES.

five tons, the hind axle can carry half of this when distributed along its length; and a ton's weight may be suspended from its middle point. The wheels will of course bear this if the tires be broad

enough for the ground. If narrow tired they would sink into moderately soft soil, like prairie land for example. If the reach is fairly strong, it may be used as a lever for lifting heavy stones as shown in the engraving, and the detached hind axle and wheels used to transport the stone to any point desired. It needs lifting only far enough to just clear the ground.—Mr. Jno. Wagner, of Grant Co., Wis., suggests using the wagon reach in a similar way for lifting fence posts out of the ground when wishing to move them. Another correspondent proposes the same arrangement as a "stump-puller," but with the exception of some of the immense wagons sometimes provided for transporting ship timber and the like, the vehicle would not be strong enough, or the leverage great enough to lift out any stumps that could not be pried out with a long crowbar or a large pole used as a lever.

Connecting an Old and New Cistern.

Mr. B. C. Guerin, of Morristown, N. J., sends us a sketch and description of a method that will occasionally be found convenient, when it is desired to connect a new cistern with an old one without loss

CONNECTING TWO CISTERNS.

of water. Whatever the distance apart, provide a two-inch iron pipe, *a*, long enough to extend from the inside of the new well to the outside of the old one, and fit upon the right end of it by screw thread the pipe, *b*, long enough to extend well through the old wall. Build *a* into the new well and close its left end with a wooden plug, *p*. When ready, pump or syphon the water from the old to the new cistern. Then open the old wall, screw *b* on to *a* and cement around *b*. When ready, with a rod or bar, knock out the plug which will float to the top, and the water will stand at a level in both cisterns. A connecting five or six-inch glazed ware or iron pipe, *c*, should be put in on a level with the overflow pipe, *e*. One pump and one over-flow pipe answer for both cisterns.

Volunteer Distribution of Seeds and Cions.

Much may be done for the improvement of horticulture by the volunteer distribution of seeds and cions, either with or without the aid of associations. Horticultural societies succeed, as a rule, only in the cities and large towns, and farmer's clubs are the exception even in thrifty agricultural towns. But almost any enterprising farmer can do a great work for improvement in his own town or parish, by the distribution of seeds and cions he has procured and tested. He starts with the idea of providing for himself and family the best fruits and vegetables his soil and climate will produce, and disposing of the balance at the best market town within reach. From the papers he learns at small cost what are the best varieties of sweet corn, squashes, melons, and cucumbers; he procures and raises them, and exhibits them at the county fair. He is satisfied that he has a good thing, for instance in the Early Marblehead sweet corn, which gives him this vegetable several days earlier than anything else in the market, and two or three weeks earlier than the common kind grown in his vicinity. It would be no great tax upon his purse or his time, to leave one or two hundred well-ripened selected ears at the post-

office or grocery, to be supplied, an ear each, to those getting their letters or groceries. The average post-master or grocer, in a farming community, would gladly distribute seeds, cions, and plants, without compensation, to help in a good work. There are centers in almost every agricultural town where people gather for business and trade, where each family cultivating a garden, could be furnished with the choicest varieties of fruits and vegetables. This would in no way interfere with the sales of the seedsmen and nurserymen, but rather increase the demand. The best districts for their business are where the taste for good gardening is already established, and every man is experimenting, and adding to the valuable things already possessed. The great difficulty in any community in improving horticulture is to get a few neighbors to make their first investment in improved varieties. When one has planted his first Bartlett pear tree, his first Delaware or Concord grape, his first improved strawberry or raspberry, and eaten the fruit, there is no man more ready to invest in seeds and plants. Seeing is believing. Eighty years ago or more there was a clergyman settled in one of the feeble country parishes of Connecticut, whose horticultural tastes were as sound as his views in theology. He preached good gardening six days in the week, by example as well as precept, cultivated fine apples, pears, and grapes, made his home an oasis in the wilderness, and distributed seeds, cions, and plants with a liberal hand. Great improvement in the horticulture of the whole town resulted, and the impress of his ministry in the pulpit and the garden is still visible there in almost every home. This ministry in horticulture is within reach of almost every farmer, and is one of the easiest and most effective ways of doing good. It has an important bearing upon morals and the right training of the rising generation. Stomachs fed with the milk and honey of fine gardens, are not so likely to crave alcohol and tobacco. The distribution of seeds and plants is in order now. CONNECTICUT.

A Useful Hand-Light.

Among the many helps found useful or necessary by the European gardener, is the hand-light and the bell-glass, the latter the *cloche* of the French. One sees in the market-gardens around Paris *cloches* by the acre. They are bell-shaped, about fifteen inches high, and the same in width across the mouth, and are now made without a knob for a handle at the top. These are used for covering seeds, cuttings, etc., but especially in growing lettuce and cauliflowers, for both of which they are employed on a large scale. Our market gardeners could not use these with profit, as steamboats and railroads can place the produce of southern gardens in the market cheaper than they can raise it under such glasses. The amateur gardener will often find a hand-light of some kind

Fig. 1.—A STORE HAND-LIGHT.

convenient to protect tender plants, etc. Fig. 1 shows the kind usually sold; it is costly, easily broken, and difficult to repair. We have suggested as a substitute a grocery box of convenient size, removing top and bottom and covering the top with light cotton sheeting; or a frame may be nailed together of six or eight-inch boards, and covered in the same manner. When more light than the cloth will admit is needed, a similar

frame may be covered with a pane of glass. Such frames are a great aid in forwarding and protecting young melon, cucumber, and other vines, and in a private garden are worth the trouble of making them. The objection to all such hastily made substitutes is, they are not cared for, and, when wanted for use a second time, are often not to be found. It is well to have a few well-made hand-lights to meet sudden requirements, as they may be stored away and be ready when needed. Fig. 2 represents a form that we have found convenient, and it will be well to have them of at least

Fig. 2.—HOME-MADE HAND-LIGHT.

two sizes, using for some a single pane more nearly square. The engraving requires no description. If strengthened by hoop-iron straps at the corners, and painted, or treated to a few coats of crude petroleum, these protectors will last many years.

Plantain and Other Weeds.

Among the questions most frequently asked us, are those relating to the destruction of weeds of different kinds. A subscriber at New Lisbon, N. Y., asks: "What will kill Plantain? We have a lot of ten acres covered with it, and threatens to run out everything else."—This is an illustration of a majority of the inquiries, they ask, "What will kill," instead of "How can I kill" this or that weed. There is a general impression that something may be applied to the soil, so discriminating, that it will destroy the weeds, and leave the plants of the crop unharmed. Though we have many times shown that this is impossible, the idea still prevails. Nothing can be put upon the land that will of itself destroy weeds, and let the other plants alone. The only manner in which any application can kill weeds is, by stimulating the growth of the crop to such a degree that it will crowd out and smother them. Weeds come into our lands in various ways. We sow them, they are brought in by ourselves and our animals, and they are brought by the winds. By far the most frequent method is, by unintentional sowing. Weeds are taken to the manure heap or the pig-pen, where they ripen their seeds before they decay, and when the manure is applied to the land, that is manured and at the same time seeded for an abundant crop; seeds of weeds are also sown with other seeds, especially those of grasses and clover. Every farmer should be familiar with the appearance of these seeds, and if on examination of a small sample, better with a microscope or magnifier, any other seeds are seen, do not sow them. Several seeds have hooks by which they cling to the coats of animals, and to our own clothing, and many weeds may be introduced upon the farm in this manner. Winds and streams convey the seeds of weeds, though not so frequently as some suppose. All the other causes together, introduce fewer than the farmer himself, by his indifference to the quality of his seeds and his manure.

As to destroying the weeds after they are once on the farm—there are weeds and weeds, and a knowledge of their nature will be a great aid in the warfare against them. Like other plants, they are annual, biennial, or perennial. Annual weeds come up, and die the first season, and that is the end of them. But before they depart, they make abundant provision for a succession, by producing a multitude of seeds to carry on the work. The earlier such weeds are destroyed, the better, as some perfect their seeds when quite small. The cultivation of crops that must be frequently worked by hand or horse implements, is the most ready way of getting rid of them. Biennial and perennial weeds the first year from sowing, prepare to produce seeds the next year, and are usually not

conspicuous the first season, there being only a tuft of leaves lying close to the ground, looking innocent, but preparing for mischief, by laying in provisions for an active growth the next year. The biennial, the second year, shoots up a flower-stalk, perfects its seeds, and dies. The perennial shoots up a flower stalk, perfects its seeds and don't die, but on the contrary lays up in its roots provisions for a more active campaign the third year, and so on continuously. When such weeds are established, their spread should be prevented by cutting off their seed-stalks, or rather flower-stalks, before seeds are formed. If the flower-stalks of a biennial weed are cut away, the plant will die sooner or later, and give no further trouble. Not so the perennial weeds, the measures for their extermination must differ with the nature of the plants and their numbers. In some cases, pulling or digging up the roots will be cheapest; in others, the constant cutting of the leaves as soon and as often as they appear at the surface of the ground, will answer. Again, it may be best to smother the weeds with a heavy growth of Buckwheat, or the Southern Cow Pea. This last makes a remarkably dense mat of vines and foliage, under which nothing can live. We have thus indicated the general methods to be followed in the destruction of weeds. Those persons will be most successful in applying them who acquaint themselves with the plants known as weeds, and are able to recognize them at every stage, and who consider their habit of growth in undertaking their destruction. Every farmer should recollect that a sharp hoe properly applied to any weed in its youth, will avoid much trouble in future.

How Roses Are Produced Cheaply.

Some of our amateur friends, who make cuttings of several joints when they propagate roses, wonder how florists can turn out roses so rapidly and at such a low price. The large establishments which make a specialty of roses or any other plants, are regular factories, with everything arranged for the end in view. The roses to furnish the cuttings are potted the fall before and kept in a cool greenhouse or pit until the time they must be started into growth to furnish shoots from which to make cuttings. Instead of taking these several inches long, the stem is cut into pieces with a single leaf

A ROSE CUTTING.

each. The leaf has a bud in its axil, and is planted in the sand of the cutting bench as shown in the engraving. The cuttings are made from tender shoots, but sufficiently mature to have formed buds in the axils of the leaves. Of course the temperature of both the sand and the air of the house must be properly controlled to produce the best results. Amateurs, who need at most a few dozen roses, will not expect to raise them in this manner. Even if they have a propagating house it would be vastly cheaper to buy the few plants needed than to give the necessary care and attention, which would be nearly as much for a few dozens as for several thousands. The "saucer method," described last month, p. 99, comes to the help of the amateur. We have not tried it for roses from very young shoots, but from our success with other shrubs in rooting them from very green wood, we have little doubt of its success. Observe that the sand is to be made as wet as mud, and kept so. Drying out will destroy the roots. The cuttings should be from the green shoots pushed by the window plants, as soon as buds are formed—not flower buds, but the leaf-buds, those which when

they start will push other shoots, and are found at the angle where leaf-stalk and stem join. As soon as roots, even small ones, appear on the cuttings, they should be potted out in good, fine soil.

Potato and Seed Tubes.

F. GRUNDY.

To enable one to drop potatoes in planting just where they are wanted without having to stoop down, the writer devised the simple apparatus

Fig. 1.—POTATO TUBE.

shown in figure 1. It is merely a tin tube to hang upon the edge of a pail. The hooks go well down into it to give a good grip. It is an excellent aid in sowing chemical fertilizers along the row.—Some potato planters carry the sets in a sack, over the shoulder and under the arm, with an opening in front, as in sowing small grain. In this case the pail is not used but a handle is attached to the tube. Carry it in one hand and drop the sets through it with the other.

Fig. 2.—A SEED TUBE.

—Figure 2 is a similar but smaller tube permanently fastened to a two-quart tin cup, for sowing small seeds, the sower standing nearly erect and dropping the seed where wanted, regardless of wind or weather. It is a simple and cheap affair, but the gardener who once uses it will ever after consider it indispensable.

Strawberries on the Farm.

Farmers and their families should have an abundance of the best the earth produces, but they too often content themselves with meagre fare, and regard as luxuries those things which others, far less able to have them, look upon as matters of course. Generally if there are strawberries on the farmer's table, children have hunted them in the fields (and there can be none better as to quality); they are so hard to find and slow to pick that their visits are not repeated many times during the season. These many years we have insisted that the farmer's family should have strawberries and plenty of them; not a few times in the season, but three times a day every day, and so many that the saucers can be refilled again and again, until each one has had enough. This is easily possible if one really wishes to accomplish it. We have in former years shown how a patch may be planted and cared for with little trouble. If one has an abundance of plants the rest is very easy. Still, however desirable it may be to have a large strawberry patch, it may not be convenient to expend the few dollars needed to buy plants to fill it. If plants can

not well be purchased to set out a large bed now, they can be raised for setting a bed next fall or spring, and it is the object of this present article to show how this may be done. Of course there must be strawberry plants to start with, and unless a neighbor who has an established bed can afford a few, they must be bought. The outlay need not be large; the leading dealers vary in their prices, but the average charge is thirty cents a dozen for standard varieties, delivered by mail. A dozen plants, properly treated, will during the season furnish enough young plants to stock a large bed. If there is no nursery in the vicinity order the plants, if only a dozen, at once, to be sent by mail.

The catalogues are confusing with their many varieties, old and new. For home use, no new or untried kinds are worth taking as a gift; what we want is fruit and plenty of it. Charles Downing, Bidwell, and Sharpless are among the reliable kinds that have been tested and may be planted with confidence. Having ordered the plants, prepare a place for them. The size of the bed will of course depend upon the number of plants, which are to be two feet apart each way from one another, and two feet from the margins of the bed. Make the soil rich with old, decomposed manure and ashes, to be worked in as deep as possible by spading. When the plants come, their roots should be shortened or cut back to two-thirds or one-half their former length, and all the dead leaves removed. In planting, open a wide hole with the hand, and spreading the roots in all directions, separating those that are matted, carefully work the earth in among them, and having covered them with earth press it firmly over them. The plants will soon start into growth, and new leaves open. It is probable that clusters of flower buds will appear in the center of some of the plants; if so, pinch them off as soon as they are seen, as we now wish to raise plants and not fruit. As the season advances, runners will be formed, and at length a bud will appear upon the end of each and finally take root. If the runners do not become fixed readily—as they are often blown about by the winds—place a clod of earth upon them to hold them fast. After the plant from the first bud has grown to some size, that will throw out runners, and so on, all the season. The object being to raise as many plants as possible, the runners should be watched, and not allowed to interfere with one another, but distributed evenly over the bed. If necessary water the bed, and pull up by hand all weeds that appear.

Fences Across Freshet Streams.

When fences extend across brooks subject to freshets that bring down brushwood or other material liable to lodge, a section or two may be constructed to swing down stream, as in the engraving and to be ordinarily held in place by stakes, or by tying at one or both ends. The width, strength and size of the bases supporting the side posts, and of the braces, will depend upon the width and depth of the channel. The base pieces can be firmly anchored by stakes driven slanting over the ends and outsides, or by stones piled on. For wide, shallow streams, three or even more braced uprights can be anchored eight or ten feet apart in the bed with heavy stones, with two or more

A FRESHET FENCE.

swinging sections. If small trees or long timbers are likely to float down, the swinging gate may be twelve or fifteen feet wide. For smaller streams, with strong high banks, five or six feet will suffice.

An Improved Wagon Jack.

Mr. D. E. Stevens, Hedgewood, Kans., referring to the two jacks in *American Agriculturist* for August last, sends us a description of one he has used with great satisfaction. It is home-made, requiring only an iron clevis to be quickly formed by a blacksmith. As seen in the engraving, by turning the lever over to the right or to the left, it is adapted to fore or hind axle, or those of different heights. The following convenient dimensions will enable any one to construct it. The upright *u* is a two by four scantling twenty-two inches long, spiked on a base of plank, *b*, sixteen inches long and four inches wide, with side braces of inch boards, or iron rods, if at hand. Half-inch holes are bored through one at *r*, two inches from the top, and one at *t*, twelve inches below *u*. A slot one and a half inch wide, is cut down from the top through the middle, fifteen inches deep, in which the lever *l* moves and turns its larger end.—This lever is cut from a hard-wood plank one and a quarter inch thick, four feet long, and seven inches wide at the upright, and tapering out to three inches or so wide. At seven inches from its large end and two

A WAGON JACK.

and a half inches from one side, a hole is made through it for the insertion of the bolt at *r*, which is to be headed down flat so as to allow the clevis to turn over and past it. A slot, *s*, is cut through it, three-quarters of an inch wide and nine inches long, beginning two inches from the hole at *r*. The larger end is hollowed out a little at *n*, *n*, to catch on to the axle.—The clevis *c* is a half-inch iron rod bent to four and a half inches in the clear, with holes for the insertion of bolt at *t*. This is fifteen inches long; one end is slipped through the slot *s*, and the two ends brought round and bolted at *t*, to turn on the bolt, which may have a head and nut or key to hold it in. At the end of the slot, *s*, one or more notches can be cut for the bow end of the clevis to drop into and lock the lever when the wheel is raised.

Getting Out of the Ruts.

There is some foundation for the reputation farmers have of running their business in ruts. Routine is a good thing in its place, but divergence has its advantages. All improvements are made by those who get out of the beaten track, and try new crops, new fertilizers, new stock and tools, and new methods. Every farmer should study the new things set forth in the agricultural papers, and at the farmers' clubs, and other agricultural gatherings. He will find chaff among the wheat no doubt, but the sifting process cultivates a habit of thinking, and adds to his knowledge every year. It is important to have half an acre or more devoted to experiments in fertilizers, in new vegetables and fruits, in draining and subsoiling, in shallow and deep manuring. A hint in your paper is one thing; a test in the soil, under your own supervision, is quite another. It is barren upon the printed page; but when committed to the soil it may fructify and bear fruit, some thirty, some sixty, and some an hundred fold.

Hillside Cattle Barn.

SECOND PRIZE.—BY J. F. WHEAT, CROTON, DEL. CO., N. Y.

The barn, shown in figures 1 to 7, is planned especially for a dairy farm, but can be readily adapted to other live stock by an appropriate arrangement of the divisions on the cattle floor. It is provided for a side-hill situation, of which there

up into the shutes. *B*, a good-width stair to the floor below....Figure 5 is the middle or granary and feed floor; its position is indicated in fig. 3. A platform extends from this floor, four feet out to the lower driveway for loading and unloading grain, bringing in implements, etc., etc. So much of this floor as is needed is devoted to grain and feed bins; and the rest to storing farm machinery, implements, sleds and sleighs, and may be used for

Fig. 1.—SIDE VIEW OF A HILLSIDE BARN.

are multitudes of good ones in this and other parts of the country. The side view, fig. 1, in connection with the other figures, will show its general construction. The main building is fifty feet square, with a covered extension of the main upper floor or bridge, twenty feet to the roadway, which has supporting side walls of stone, dressed or undressed as may be convenient. This arrangement allows hay and grain to be hauled from the higher ground directly into the main floor at the very top of the building, so that all unloading and moving of the material is downward, until it reaches the manure pit, thus saving lifting. Under the bridge is another driveway, the side next the barn sustained by a stone wall, parallel to and four feet from it, leaving a passage-way for animals into the basement....Figure 2 is an outside or elevation

Fig. 2.—LOWER END OF BARN.

view of the end on the lower side, opposite the main entrance....Figure 3 shows the framing or timbers of that end, and the position of the main drive floor, and other parts....Figure 4 is the main drive floor; *a, a*, are shutes, the side of each next the hay being short boards set in loosely as the bays are filled, and removed piece by piece as they are emptied, so that there is no lifting of hay

corn, fodder, etc. *A, a* are the continuation downward of the shutes; *b*, stairs and floor above (same as *b*, fig. 4); *c*, stairs to floor below; *d*, door to bins; *e, e, e*, bins, and *f*, passage-way between them.—It is convenient to have a spout to bring grain from the threshing floor down to these bins, and other spouts to convey ground feed, etc., from the bins to the feeding alley or the cattle floor below....Figure 6 is the cattle floor (marked basement in fig. 3) which is arranged for thirty cows, three feet being allowed to each cow, but by utilizing part of the space given to calf pens, etc., the floor may accommodate forty cows, for which there is ample room in the barn to store sufficient feed, all under one roof, to take them through the severest winter. Height of ceilings eight feet. It will be noted that the alley, mangers, etc., of this floor run across the building, the windows, *w, w, w*, in the lower side of the engraving being those of the lower row on fig. 2, and the doors on the right side the same as those shown in fig. 1. The calf stable is for calves the first winter, and will hold six head. The calf pens are for very young calves. The stall with manger is for a bull. The feeding alley is ten feet wide; it has shutes overhead, through which hay comes down from the mows. Other spouts, not shown, come from the bins above. The feeding mangers are two feet wide. The platforms are four and a half feet for medium-sized cows, and two inches wider for larger ones; it is well to have this width vary and place the larger cows on the wider portions. The gutters are eighteen inches wide, four inches deep at the ends and in the center, and six inches at the drainage holes, giving an incline to carry off the urine. The manure is passed to the cellar through *m, m, m, m*, (to *m, m, m*, fig. 7). The walks behind the cows are four feet wide. The small *x's* show the places of the posts, which it will be noticed are planned to be out of the way, those in the stalls passing between the cows. Gates *g, g, g*, three and a half feet high, serve for partitions as well. The doors and windows, *d, d*, and *w, w*, admit plenty of light and air for ventilation in summer, and the whole arrangement allows of "soiling" cattle where this is practised.—For fastening cows I prefer a chain or rope around the neck fastened to a large ring sliding up and down on an upright

round post....Figure 7 shows the sub-basement, its entrance being at the lower end, as shown by the large doors in fig. 2. This is only twenty-four feet wide and thirty-two feet long. The entrance is at least ten feet wide, with two hinged doors, or one sliding one. The drive-way is inclined downward from the entrance, the manure carts being backed in for loading. *M, m, m, m* show the manure as dropped through from *m, m*, in fig. 6; it is of course spread out along the sides and at the rear as it accumulates. The posts, *p, p*, are on firm, solid bases to support the weight above, as these or their continuation extend up to the roof. Windows, *w, w*, in the walls or underpinning supply air currents through the cellar. This manure cellar, to which some object, I consider one of the best features of such a barn, after a dozen years of experience. I would much sooner risk cattle over them than without them, for the reason that they can be kept cleaned out in summer and have currents of pure air constantly flowing through, while the ordinary stable floors are seldom water tight, but more or less of the liquid manure leaks through, and accumulates for years, gathering in sickening pools, and sending up anything but healthful effluvia....Except where the cost of excavating is very great, in rock and hard pan, this building can be erected for from two thousand to two thousand five hundred dollars, covered with matched pine boards, painted outside two coats, and finished inside in good shape. The cost will depend upon location, price of material, whether timber and lumber is supplied on the farm, etc.

Large Poultry Yard.

H. Miltman, of Lower Saucon, Northampton Co., Pa., writes us: I intend to begin poultry keeping as a business and would like to have a plan for a poultry house, combining all the best features that experience has suggested. The place I have selected for my poultry yard is a dry strip of meadow, containing about two acres, of which I shall take as much as required. The ground slopes away from a mill-race bordering its upper side, and can be very rapidly drained if necessary. I consider the mill-race an admirable place for ducks and geese, and also as a source of water for the hens. Is my ground suitable? What is the best breed of fowls for market, poultry, and for eggs?

You will find numerous excellent plans in back numbers of the *American Agriculturist*.—The land must be well drained. Open ditches will answer perfectly. Probably the Plymouth Rock cross will

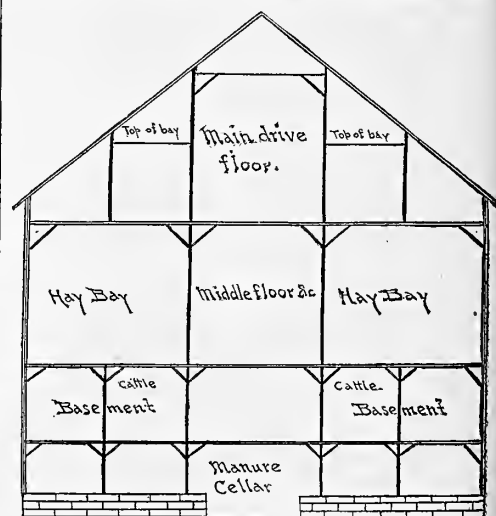

Fig. 3.—FRAMING OF LOWER END.

prove as valuable a first cross as any for common hens. Next year, or the second year, take another cross, selecting it from either the laying breeds like the Leghorns, or the flesh-producing breeds like the Dorkings or Asiatics. Ducks may be successfully raised with very little water for swimming. The main points in poultry raising are: clean nests and roosts, an abundance of wholesome food, and a plenty of pure drinking water.

Lightning and Lightning Rods.

ORANGE JUDD.

Spring has come and "the voice of the lightning rod man will be again heard in the land," as he goes up and down among farmers, seeking whom he may devour. In autumn, when muttering thunders retire southward with the sweet-voiced songsters, the lightning "regulator"

Fig. 4.—THE MAIN DRIVE FLOOR.

calls in his forces, his traps, his wagons and horses, disposing of the latter, or putting them out to board for the winter if the state of the market does not favor a sale. But as soon as the zigzag streams of light dart athwart the spring clouds, and awaken the fears of the nervous, he, like the circus man, gathers his retinue and takes possession of the field of operations decided upon the previous year, or selected during the winter's leisure, with his vocabulary re-enforced by some new arguments and his wagon with one or more newfangled "points," "angles," "insulators," "rods," "joints," etcetera.

Lightning as seen, is the light produced by the swift passage of electricity through the air from cloud to cloud, or from the clouds to the earth, or the earth to the clouds, or both. Its velocity is almost inconceivable, equal to going seven times around the world between two ticks of a three-foot clock pendulum; or, say about five hundred times faster than a ball flies as it leaves a heavily-loaded rifle.—The air does not conduct electricity through it, but it forces its way along, driving the air particles together, and, so to speak, squeezing the heat

Fig. 5.—MIDDLE OR FEED FLOOR.

out. If we push a tightly-fitting rod down a gun harrel, crowding the air suddenly into a small space, the air will give out so much heat as to become red hot and set fire to a piece of tinder in the bottom. So we may suppose the swift lightning pushes the air together before it until it becomes brilliantly red-hot (lightning), and when much air is compressed before it, it darts off until more air is compressed in the new line and then it shoots another way, and thus we have its zigzag course. This driving and beating the air produces the sound we call thunder. We get sound by agitating the air when beat-

ing a drum-head, or vibrating the strings of an instrument, by exploding powder in it, etc. The more violent agitation by the swift lightning produces the loud thunder, though a lightning stream of electricity is so small at any one point that it shakes the air less than a heavy cannon charge of powder. (Thunder is seldom heard ten miles, while a battle has been heard forty miles or more). The rolling of thunder is caused by sounds coming in from different distances one after another, as the electricity darts from cloud to cloud, farther or nearer from us, a thunder sound being produced between each pair of clouds. It is as if a score or more of cannon, each a little further off, were all fired at the same moment; we would have by the reports coming one after the other a rolling sound just like thunder.

Light comes almost instantaneously from a distant point, while sound takes nearly five seconds to come a mile through the air. If we see the flash of a cannon and begin counting one, two, three, only as fast as a three-foot pendulum ticks, about the time we count five the sound of the cannon will arrive. After a sharp flash of lightning count as above, and the real lightning cloud is as many fifths of a mile away as you count seconds. If you count four or more, you may know that that lightning cloud is at a safe distance. If coming towards you, the thunder will more quickly follow the lightning; if going from you you will count more at each successive flash; if counting about the same number, it is going by. Understanding this will help quiet nervous people.

While electricity is not conducted by air, but jumps across, or through air spaces, producing lightning and thunder, it will go quietly along or through the metals, passing from one particle to another. A quantity of electricity that would rend the air, produce blinding lightning and deafening thunder, would run through or along a copper rod no larger than your finger so quietly that you would not perceive it. It would do the same on an iron rod a little larger. Iron is a good conductor of electricity, and copper and pure silver are still better. A tube filled with water, if large enough, would conduct the electricity, and so would a rod of wood if its pores were full of water; moist flesh will do the same, but not nearly so well as the metal. The electricity would not go through a glass rod at all, nor through a wax one, nor through a dry stick, or feathers. Remember that there are good conductors, as silver, copper, iron, etc.; poor ones like wet wood, the bodies of animals, cotton, etc., and non-conductors like glass, wax, and very dry wood. This will enable us to understand lightning rods further on.

The condensation of vapors in forming clouds develops a good deal of electricity. The clouds float on the non-conducting air, and the excess of electricity cannot get away. Another cloud coming near, having less electricity, some of the excess jumps across the intervening air space, producing lightning and thunder as it forces itself through the resisting air. But now suppose the over-charged cloud gets near the earth. Some of the excess of electricity will strike off to the ground tearing its way down straight through the air, or zigzag if the distance be far. This cloud being thus relieved, other over-charged clouds in the vicinity may send over to it their excess, and there will be sundry lightnings, though usually they all join in sending the one grand charge to the earth, and there is quiet until more electricity accumulates.* In a continuous rain, enough electricity runs down the rain-charged air to stop heavy discharges.

Now suppose one of these clouds passing over us has a good deal of extra electricity, but not quite enough to strike through the whole air between it and the earth. But it comes in the neighborhood of a tree containing sap-moisture which is a moderately good conductor. That helps bridge the distance to the earth. The electricity strikes into the sap and follows it down. If the cloud in small the charge may find roadway enough to get through quietly to the ground. If there are many trees, as in a forest, they will together supply sufficient roadway to the earth. Lightning seldom strikes trees in a forest, unless one is much higher than the rest and reaches up to a high cloud. But if the tree stands alone and there is more electricity than can go along its sap easily, it will split and rend the tree in going through it. So it is never safe to go under a lone tree in a thunder-storm. If there was a small metal rod down through the tree the effect would be similar. If on outside of the tree, and large enough, all electricity would run down the rod.

Note this especially: If the iron rod has a sharp point at the top, the electricity will spin off in a continuous little stream, so to speak, and unobserved. If the top is a round ball or a blunt end, a large lot of the electricity will jump from the cloud to it in a mass, with a report as loud as a pop-gun, a pistol, or a cannon, according to the amount, and if a very heavy charge, more than the rod

* Scientific men will excuse our omission to speak of positive and negative electricity, etc., in this attempt to give a little popular instruction to non-scientific readers.

can carry, it may melt it, and some of it may strike off to the moist wood of the tree, and perhaps rend that.

Note this also. Anything between the charged cloud and the earth, that helps to shorten the distance, will help to a discharge of the electricity that might otherwise have floated by. A man's moist body may be just enough to enable the electrical discharge to get from the cloud to the earth through the resisting air. A gun-harrel will help a good deal more. Even an umbrella, with its metal rods and top, may be enough; so may a pitch-fork in his hand, or scythe on his shoulder. The electricity will take to his moist, poor conducting body in preference to the air, and if the discharge is large, the fluids of his body will only carry part of it and he

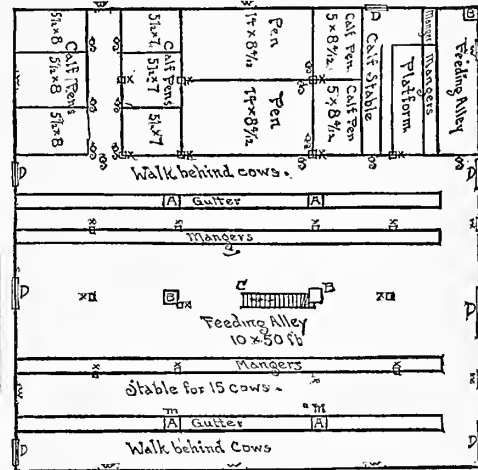

Fig. 6.—THE CATTLE FLOOR.

will be killed, or if but a small discharge, he may be only temporarily stunned, and proper efforts may get the organs of the body into motion again, just as if they have been stopped by drowning.

Note again, that glass, wax, feathers, etc., are non-conductors. If a person stands on any one of these, or is covered with one unless it is very thin, the electricity will not go through that line. Nervous people may feel perfectly safe in a thunder-storm if they can get upon a cake of wax, or thick plate of glass, with the clothing drawn close to the lower limbs, and not sit or stand too near a wall or chimney.—Moist air rising from a chimney or from fresh hay or grain in a barn, is a partial conductor, that frequently helps form a channel from a cloud to the earth, and thus invites a lightning stroke. Hence the special utility of lightning rods in such cases. Any building having moist parts, or metals, supplies partial but attracting roadways from the clouds to the earth.

To Drive Away Rats.—Mary Hadlem writes us that rats have so strong an aversion to the odor of peppermint, they will not enter rooms or bins

Fig. 7.—THE MANURE CELLAR.

where it prevails. She says of the peppermint plant: "We place it in the oats, rye and corn, when they are brought in, and some goes under the pig-stye. Though we no longer have any rats, we continue to use the plant, for fear they may make us a visit." If this is so, in the absence of the plant, probably a few drops of the oil of peppermint would answer the same purpose.

The Far-West Pioneer's Home.

R. G. NEWTON.

The first great need of the pioneer settler is a shelter of some kind for himself and family. This house will depend very much on the amount of money on hand and the distance lumber has to be brought from the railroad. With a few feet of lumber and a little tarred paper one

Lay the sods grass side up. After a layer is down, fill up any holes or spaces with the pieces trimmed off from the ends. Then with the mallet or the side of the axe go all over the course and level it down, especially on the joints. Fill up and pound down any hollow or open spaces. Lay three more courses in the same way, breaking joints with the course below, carefully pounding down every course and filling in with small pieces where necessary. The next course should be laid across the

to which the rafters are nailed. The object of these is to fasten the roof down firmly, and prevent the winds from lifting it up and carrying it off, as it might do some stormy night. After the top of the sods is leveled and hammered down, place on the roof, which may be of inch boards. Nail them firmly to rafters and plates on the side walls, and cover with two thicknesses of tarred paper, running them up and down, and lapping the joints in each layer about three inches. Lay the paper

Fig. 1.—A PRAIRIE SOD-HOUSE.

can build a warm and comfortable shanty from the materials to be found on every prairie farm. Sod walls, if rightly made, will keep out cold very well. Select a piece of level ground, with a good turf—if the grass is high it will require mowing—and free from gravel and small stones. Set the plow so that it will turn a sod about four inches thick and as wide as the plow will cut out clean. This should of course be done as near where you wish to build as possible. You must have your door and window frames all ready before commencing the wall. The door frames should be made of two by eight joist; two pieces cut thirty inches long and two pieces seventy-six inches long. Nail them together with spikes or twenty-penny nails, setting a short piece at each end between the long ones. This makes a frame thirty inches wide by six feet high inside. On the outside of these joist, sides and top, nail a strip three or four inches wide on edge-wise about two inches from the outside edge. The window frames may be made of inch boards ten or twelve inches wide, and such a size inside as will nicely fit the sash—the bottom board slanting out to shed rain. The frame requires a strip nailed on the top and each side similar to the door frames. In laying the sods you will need a hatchet with a blade about six inches wide, to cut the sods into lengths; a carpenter's mallet, and an old butcher or case knife.

Mark out the size of the building inside, set the door

Fig. 3.—GROUND PLAN OF HOUSE.

frames in their places, staying them firmly upright, with the inside edge flush with the inside wall. Cut the sods into lengths about eighteen to twenty-four inches long. Lay a course lengthwise as shown in figure 6, fitting the ends closely together by paring them off with the knife when required. Keep the inside edge of this course close to the line of the inside of the building. Outside of this lay two or more courses, depending on the height of the wall. Four feet wide is none too much for a wall eight feet high, unless on a very small building. Be careful to fit the courses closely together, and break joints with each course. Place one layer all around the full width as shown in figure 4. These will be found of great service, especially each side of the doors, and may be about thirty inches wide and project four to six feet,

wall to bind the sods firmly together. If the wall is four feet wide, cut one piece thirty inches long, the other eighteen inches, and lay them as in figure 4. Next lay four courses lengthwise, same as at first, carrying up the abutments with the wall, until within four inches of the bottom of a window. Cut a piece of two by four scant-

Fig. 4.

ling about a foot longer than the width of the window, and lay it on the wall so it will come about two inches from the outside of the window frame when it is set in its place. If the walls project into the room about two inches more than wanted, they may be trimmed off smooth when finished. After laying the scantling as directed, place on another layer of sods all around, level with top of scantling. Outside of the scantling pound the sod down, slanting it towards the outside of the wall, so that an inch board laid on will come level with the top of the scantling and project about three inches over the wall as in figure 8. This will carry off all water that may drive against the window. Set the window frames in their place and nail them to the board and to the two by four pieces. The frames should then be braced, and the wall carried to the desired height.

When getting up to about two feet of the top it is well to take some pieces of one by six, about two and a half feet long, and nail them to a piece of two by four, scantling a foot long (see figure 5). Set one of these in each corner, as at a in figure 6, also one in each gable end if the house is built like figure 1. If the building is sixteen feet or more long or wide the pieces may be set in on the walls about four feet apart, then carry up the wall to the height wanted, lay a scantling on flat, bringing it up tight to the pieces just built in the wall, and nail them solidly together, putting the two by six scantling, so that the inside edge will come flush with the inside of wall. Cut the ends of the sticks off when they project above, and lay on another course of sod to bring the wall level with top.

Fig. 7.—SECTION OF WINDOW.

six-inch rafters every four feet, setting them up edge-wise. You can cut down into the wall with a knife after it is all done, and it will be well to build in some pieces

Fig. 2.—A LARGER SOD-HOUSE.

over the ends of the roof hoards, which should be cut off true, and tack on lath or battens every eight inches apart, running them up and down. Such a tarred paper roof will shed water for a year without any repairs, if you have been careful not to cut or tear the paper, and if it projects over the sides about a foot, as it should,

Fig. 5.

Fig. 6.

the sod building will stand for a number of years and furnish a comfortable shelter for a family.

After the house is all complete, pare off the sods on the outside, so they will look as smooth as a well-laid brick wall, using the hatchet for this purpose. The wall may be drawn in as it is built up, until it is only about half as thick at the top as at the bottom. Pound the outside edges of the sods so they will slant down and help shed any rain that may strike on them. After the inside is all pared off smooth, nail some four-inch

Fig. 8.—A WINDOW CAP.

boards up and down, fastening the upper ends into the plates or rafters. Saw off blocks about a foot long, drive them into the wall about three feet apart and nail the strips to these. By tacking on common brown building paper and pasting old newspapers over this, the interior is made as neat as if built entirely of wood. Nothing short of a cyclone will have any effect on such a sod house. Many of the points spoken of may seem small, but they all go towards rendering the building wind-proof. Stables and out-buildings may be built in the same way, saving many dollars in lumber that can probably be invested to good advantage, by many who will make humble homes in the Far-West.

Prairie Pests.—The prairie settler will find some new pests to contend with, when he gets in his new home. Among the smallest but not the least troublesome, are the field mice, which enter the house at any point, where they can find or make a hole to crawl through. When I built my shanty, I made it perfectly tight and mouse-proof, as I thought, but looking up one night I saw a ball of twine roll down from over head,

and then a mouse came and looked to see what he had done. I tried to see how he had come there, where I had no use for him, as it was the only place we had to store our hooks, papers, seed, etc. The next morning I went out and looked the shanty over; on one end the boards, which run up and down did not meet, and I had neglected to fit a piece in as I intended to do. As the gables lapped down over the sides, it made a nice place for mice to enter. I closed that up and set a trap, and caught the pioneer mouse.

The ground squirrels make much trouble by digging up corn and other seed after planting. Some say that they will commence at the end of a row and follow the planter. A light charge of fine shot, or a pill containing some poison, may be dropped into their holes; either will prove satisfactory, or the children can go fishing after them. Take a strong cord about ten feet long, make a slip noose at one end and tie the other to a short stick or cane. When you see one run into its hole, go and lay the slip noose around the hole and step back the length of the line; in a minute you will see a head pop up, and if you don't move, the squirrel will come halfway out of its hole; then give the line a quick jerk and you have the squirrel around the body, when you can dispose of him easily.

The coyote or kit fox and hadger are numerous in some parts, and are very destructive to poultry, not well housed at night. These pests can both be taken by traps, using a heavy one with a double spring, and attaching it to a heavy clog by a long cord, strong enough to hold them. The coyote is a very neighborly beast, and unless wounded or trapped, it will visit you regularly every night. We were awakened one night by a noise on the roof of our shanty, and we could hear the dancing of a regular jig. The coyote went too near the edge and slipped off the roof, hanging on the edge by his paws. Hearing a voice it was down and off in a second. I have seen them come to pick up the crumbs we threw out for the birds. I have not seen or heard the first house rat since coming to the Far-West.

The "Gambrel" Men Have It.—

Webster's Unabridged says: GAMMON: . . . The smoked buttock or thigh of a hog. . . etc.; GAMBREL: . . . The hind leg of a horse; a stick crooked like a horse's leg used by butchers in suspending animals which have been slaughtered for the purpose of dressing and weighing them; . . . to tie by the leg. . . etc. Worcester is nearly in accord with Webster. "Gammon stick" may not be incorrect, but it is not in accordance with general usage, which is the authority for spelling and pronunciation.

Scale Insects on the Oleander.—

Mrs. M. J. Adams, Jefferson Co., N. Y., sends us leaves of the Oleander, upon the under-side of which are numerous scale lice, apparently the species known as "Broad-scale" (*Lecanium hesperidium*), which often infests plants in the window and greenhouse. From Virginia, southward, this is the most common scale upon plants in the open air, and is very frequently found upon the orange. A very strong solution of soft-soap applied with a brush—an old tooth-brush can be used—will usually remove the scale from plants with firm evergreen leaves, like Oleander and Ivy. An emulsion of kerosene, described on page 114, is very effective upon trees in the open air, and it may be applied to house-plants with a very soft sponge, washing the leaves with clear water after a while.

Crops in a Peach Orchard.—

Chas. E. Barrett, Hillsborough Co., N. H., set out an orchard of peach trees in the spring of '82. The trees are twelve feet apart each way, and are in splendid condition. He grew beans between the trees for two years and now is in doubt what to do, whether to plant some crop or to cultivate the ground without any crop. The trees are rather close. In the famous peach districts of Delaware and Maryland the trees are set twenty feet apart each way, and corn is the only crop allowed. The first year four rows of corn are planted, the first row four feet from the trees, and the rows of corn four feet apart. The next year the rows are reduced to three, and the next to two. The trees come into bearing in the fourth year, when all crops are discontinued, and the soil plowed twice a year, throwing the furrows from the trees in spring and towards them in fall. A small plow is used near the trees, and a somewhat larger one towards the center of the "middles," as the spaces between the rows are called. Mr. B. asks if it will do to plant squashes in the orchard. So far as the trees are concerned, if the hills for the squash are well-manured, we see no objection, but with trees so near together and a short season in a northern locality, we fear that the squashes will not mature. If it is concluded to give up the ground entirely to the trees the cultivator should be used often enough to keep down the weeds.

Three Months More.

Our splendid list of Premium articles for new subscribers to the *American Agriculturist* can be obtained for three months longer. More than thirty thousand people have availed themselves of these Premium offers, to procure useful and ornamental articles for themselves and their friends. What they have done can be done by thousands of others, during the remaining three months. Any subscriber, who has not received this elegant Premium list, or who has mislaid it, can receive another one by immediately sending his address on a postal card to this office. Do not forget to state on the card that you are a subscriber. Other persons than subscribers must send five cents for postage, packing, etc.

Chat with Readers.

Bermuda-Grass Seed.—B. W. Francis, Conn., states that a leading seed-house offers Bermuda-Grass seed in its catalogue, and asks how this agrees with our statement that "this grass does not produce seed"? If our correspondent will look again he will find the statement to be that the grass had "not been known to produce seeds in this country." Seeds are produced elsewhere, but where, the seedsmen prefer to keep at present as a trade secret.

Evergreen Puzzle.—"E. B. Chamberlain," W. Valley, N. Y., sends us a bit from an evergreen tree which came up in his yard, and is different from any tree he has before seen. The tree is evidently the common Red Cedar in the juvenile state. Several evergreens, notably the Arbor Vitae, have, while young, foliage quite unlike that of the old tree. The Red Cedar is one that has, when young, foliage very different from that of the old tree. Sometimes it is many years before the tree assumes its regular leaves.

Rye for Hay.—Mr. "N. S. K.," Decatur, Ga., writes us: In reply to your inquiry about sowing rye for hay, I would state for the benefit of the readers of the *American Agriculturist*, that I sowed about fifteen acres of rye last year, and cut in the milk, but made very inferior hay. Stock did not like it, and in fact only eat it when forced to do so. Oats treated in the same manner made very nutritious hay, and stock would eat it in preference to clear clover hay.

Salt Upon Grass Land.—W. Brayton, Herkimer Co., New York, asks us if common salt would benefit grass-land, and how much should be applied. The results from the use of salt as a fertilizer have been variable, according to the crop, the soil, and the distance from the ocean. Its indirect action in strengthening the straw of grain crops has sometimes been marked, and it has been useful on plants that naturally grow near the sea. The safest way for him is to experiment, sowing broad-cast three to five bushels to the acre. Please inform us of the result.

What is Celeriac?—Several have asked this question. The name "Turnip-rooted Celery" describes its nature. It is also called "Knob Celery," principally by the Germans, who are the chief consumers of it. The base, or proper stem of the plant, is enlarged to form a kind of bulb, which is the portion used. The plants are raised in a seed-bed like the common celery, and set in rows thirty inches apart, and a foot apart in the row, and given good cultivation all summer. Any suckers that appear should be removed. The tuber is used to flavor soups, and is boiled until tender, and when cold, sliced, and dressed as a salad.

Potato "Beauty of Hebron."—A subscriber in Hillsboro Co., N. H., writes us that after trying nearly all the new potatoes for the last forty years, "I believe that the Beauty of Hebron has more good points than any other one kind." He sums up by saying that it is as early as Early Rose and several other early sorts which he names, and for yield equal to any others, "and for table use they are all that could be desired. If I plant but one kind it will be the Beauty of Hebron." This quite agrees with our own experience, and we have for several years relied upon this variety for our main crop.

A Lasting Cucumber.—Near the last of January, H. Olmsted, Esq., of New York City, brought us a cucumber, which though of large size was as green and fresh in appearance as a cucumber need be. It was taken from the vine in September last, and being of fine shape, was placed on the sill outside of the kitchen window to ripen up for seed. It remained on the outside until cold weather, when it was taken in and placed upon the sill inside of the window. After an exposure for some four months the cucumber has shown no signs of turning yellow. A singular freak, and could it be propagated might prove useful. It is by taking advantage of sports like this that valuable new varieties are often secured.

Protection for the Strawberry-bed.—D. T. Jones, Ovid, N. Y.—The strawberry-bed that was covered last fall with straw, or material for winter protection of

the plants, has still need of covering. It should be pulled apart over the plants to expose them, and be left to cover the soil. It will keep down all but a few strong weeds, which may be pulled as they appear, and keep the soil moist. Another important service is in keeping the fruit clean by preventing the heavy berries from contact with the soil. Beds that were not mulched, should be given a covering of straw, if only to protect the fruit. In the absence of other material, corn-stalks laid lengthwise between the rows, have been successfully used.

Trouble with Norway Spruce.—C. S. Lette, Star Prairie, Wis. Our letter to you was "returned to writer." In substance we said that the Balsam Fir is a free grower, and if your trees have made no progress after being planted several years there must be some error. Some dwarf evergreen may have been sent you by mistake. But your remark that your "Norway Spruce" loses all its leaves suggests the view that you have not a Norway, or any other spruce. While the spruces shed leaves that are several years old, they are never without an abundance of foliage—enough to warrant the title of evergreen. If their leaves drop, it is impossible to guess what trees you have. When they are in full foliage send us a specimen.

Verbenas from Seed.—Mrs. W. C. Mason, Bergen Co., N. J. It is not difficult to raise verbenas from seed, and if these are of a good "strain," the chances are that some fine flowers will be the result. To have them flower well the first year, the seeds should be sown early, in a window box, and as soon as large enough to handle, the seedlings should be transplanted to other boxes, or potted singly in small pots. When the weather is settled, prepare a bed of rich, light soil, and plant out the verbenas eighteen inches apart. Shade the plants in the middle of the day, until they are established. If the seeds were from a good stock, a great variety in size and color of flowers will be produced. If any of them are desirable, the plants may be taken up before cold weather for preservation, or, if room is scarce, new plants may be made from cuttings.

The Time for Hatching.—H. J. Janzer, Milwaukee, Wis., has been informed that there is a poultry establishment in which hen's eggs are hatched in considerably less than twenty-one days, and asks where this remarkable "hatchery" is located, and the process by which nature is improved upon. This is probably one of those newspaper items that wander about without any parentage. We have not heard that the time of incubation with the many incubators now in use, has been appreciably shortened, or that the old hen in this respect has been improved upon. Eggs usually hatch at the end of the twenty-first day. With especially fresh and vigorous eggs the chicks may "peck" a few hours earlier. With eggs that are not quite fresh, or from irregularity in sitting, the time may be extended one or two days. Nature and the hen fixed the date, and when eggs can be hatched earlier we shall gladly announce the fact.

Insect Trouble in Grape Canes.—Mr. C. J. Stana-back, Abilene, Dickerson Co., Kans., sends us specimens of grape canes "affected," he says, "with some sort of bug or fly."—By cutting the canes lengthwise a row of long slender eggs may be found. Each egg is placed at an angle, the inner and lower end reaching the pith of the grape stem. This mischief is probably the work of the Snowy Tree-Cricket (*Eucanthus niversus*). This cricket prefers the canes of the raspberry but also attacks the twigs of the peach, willow, etc. The cricket feeds upon the grape leaves, working at night when safe from observation. Many vineyardists have been puzzled to know how their grape-vines were stripped of their leaves in a single night. The only known way of fighting this pest is to destroy the eggs by pruning and burning the punctured canes.

A Small "Worm" in the Greenhouse.—"L." West Troy, N. Y., sends a drawing of a greenhouse pest, of which great numbers are found under the pots. Boiling water, lime, kerosene, and several other remedies have been tried without much success. The creature is not a true insect, but one of the Millipedes, or "Thousand-legs." The one in question is probably an *Idrus*, of which there are several species, often called "Wire-worms." The body is made up of numerous rings which are hard, black, or nearly so, and shining, with multitudes of legs. When disturbed they coil up into a ring. In Europe, where they appear to be more troublesome than here, traps are found more effective than poisons. Potatoes or apples are halved, the interior partly scooped out, and the pieces laid upon the soil, cut surface down. Also small flower-pots, containing partly dried horse-droppings, are laid on their sides about the greenhouse. The traps, whether potatoes or pots, are examined each morning and their contents dropped into scalding water.

Asparagus Beetle.—Mr. D. S. Harris, Providence, R. I., wishes to know the best method of fighting the Asparagus Beetle. He says they have been with him but a few years, and already threaten the existence of the asparagus beds. The beetle is blue-black with some brick-red markings. The eggs are blackish and generally fastened to the young asparagus leaves. The first brood of worms appears in June, and feed upon the tender ends of the asparagus stems. A second brood appears in August. Long Island asparagus growers have long been troubled with this insect, and have adopted the following method of fighting the pest: Early in the spring, all the plants are removed from the beds, except those for market. The female beetles are forced to lay their eggs on these shoots, and as these are soon taken to market, no eggs are left to hatch out. This method would be very effective, were it not that asparagus grows wild in many places, and such plants, unless rooted out, become propagating places for the destructive worms.

Early Truck from Florida.

LIFE in the South has its peculiar attractions. A few years ago, while awaiting in a hotel near the river for the arrival of a steamboat at Jacksonville, Fla., the writer amused himself by studying the company, made up of other travelers, of northern invalids settled in town, and natives of the soil. One of these was a lean, withered old man, whose two remaining yellow fangs were exposed every few moments by his mirthful cackle, his sense of humor being so strong that he laughed at every second remark of the by-standers.

He was airily attired in a faded calico shirt and canvas trousers, his left foot swathed in bandages; and in place of his right leg was a timber contrivance, mended with an iron in the middle where it had been broken. His hand gripped a tremendous twisted cane of grape-vine, with a crooked handle. One of the loungers having invited his party to drink, he stumped forward with the rest, and remarked to the bartender as he set out the whiskey bottle, "a little quinine in mine, Joe." Half a teaspoonful of white powder was dropped into his tumbler, which he drowed with whiskey and tossing it off, stumped back to his seat. My companion, a native of the place, remarked: "Shark Simple" prefers quinine to sugar in his drink, considering it a preventive of ague, and they keep the quinine for his sole use. It is such a good excuse for drinking, that he spends all of his time here, when not sleeping or taking his meals. You'd never think, to look at him, that that old fellow originated the business of sending truck to New York, would you? But he did. He was a fisherman until he lost his leg by a shark when his boat was capsized. Then he settled on some fine land he owned and raised a great abundance of excellent vegetables. A Captain of his acquaintance happening to be returning to New York without a cargo, "Shark Simple" got him to load his schooner with his surplus truck. The

SHARK SIMPLE.

The climate is specially favorable to this industry, being never very cold and seldom extremely hot. The warm days are cooled by the night breezes from the ocean and gulf. Occasionally frosts injure the orange harvest, but not the crops under ground or close to its surface. Spring and autumn are practically unknown; summer occupies two-thirds of the year, and the rainy season fills in the rest, giving renewed fertility to the earth. The crops are about two months earlier than in the vicinity of New York, and a supply for local consumption is raised the year round. The old negress' cry of "fresh strawberries" has roused us on a Christmas morning, and on a New Year's day walk we have seen the bare-footed field laborer in his shirt sleeves, mopping the sweat from his streaming brow.—While Florida is best known by its orange crop, the same forces that have given that industry its impetus, could be most profitably devoted to truck-raising. As yet oranges, and in a lesser degree other tropical fruits, hold the place of honor, and truck-farming remains in lower esteem and is in less energetic and enterprising hands.

The fertile soil is mainly in the northern and central sections, and as a rule back from the rivers, which are dark tortuous streams, flowing through drowned bottom lands, waste morasses, and cypress swamps, often lined with palisades of cane brake as impenetrable as the stockade of an African kraal. Back of the swamps, on the rising ground, the accumulated vegetable deposits of centuries have created spots of unsurpassed fertility. You might travel years on the sluggish tide of rivers like the St. Johns, amid the melancholy fens and forests coming down into and casting their dark shadows on the water on either side, without dreaming of the wealth in the soil but a little way off.—The natives classify Florida land as "high hummock," "low hummock," "swamp," "savanna," "pine barren," "bottom land," etc.—High hummock is timbered, and when cleared every inch can be farmed. Low hummock, also timbered, is liable to tidal overflow, but when dyked or drained, makes some of the best sugar-cane land in the State. The savanna is the meadow land along the smaller streams, needing drainage and protection against tides, but is very rich. Marsh savannas are usually drained for rice and sugar cane. The sandy soil of the coast and the

NEW YEAR'S DAY IN FLORIDA.

Drawn and Engraved for the American Agriculturist.

result justified his anticipations, and he is now well to do, little as his appearance suggests it.—The business thus began has grown into an important Florida industry, and hundreds of farmers, who do not take quinine in their whiskey, contribute to New York's luxuries, and fill their own pockets. When we once asked a Floridian what was the most important business of the State, his reply was: "Well, next to hoarding invalids, it is farming early truck for you folks up North to eat."—

pine barrens of the interior, are valueless. Truck-farming is chiefly on the high hummocks. From these a small fleet of steamers now carry several sorts of vegetables to New York, six to eight weeks in advance of the home-grown—a striking contrast to "Shark Simple's" little schooner load. He is dead now, but a small army of tillers follow his example. They commonly farm in a limited way, and there are few farms that we would consider of great magnitude; but the extreme fertili-

ty of the soil produces a large yield from a small area, with comparatively little labor, and that is cheap. The owner of a hundred cleared acres is considered rich, as riches go in Florida. Instead of shipping to Northern brokers on individual account, as formerly, the business is now systematized. Certain large New York houses have agencies in Florida, that take the stock at a fixed price from

CHRISTMAS STRAWBERRIES.

the truckers who ship it to Jacksonville, or other points, and receive their pay of the agents, and have no further care or risk. Along the St. Johns river one sees queer old tumble down wharves in the most unexpected places, often in absolute solitude, sometimes with a dilapidated shed or miserable cabin near by. From one of these a road, soon lost among the oak trees bearded with streamers of gray moss, leads back to a truck-farm, often not a great distance, but sometimes a day's journey away. At other points there is not even a wharf; the road ends at the water, the steamer receiving its freight over a gang plank. At these places, a hoy perched in a look-out tree announces the coming steamer, whose smoke he can see at a long distance. At the wharves, a flag run up gives the notification.—The truck-farmer leads a dreary, uneventful life, varied only by hunting and an occasional trip to town. Where there is a stretch of good soil, quite a number cluster; but broken as the country is by swamps and sand barrens, such neighborhoods are not too numerous; more frequently the tiller lives alone, with miles of hard travel between his house and the next neighbor. Working by day and sleeping by night is the monotonous programme year's end to year's end.

During many years past, schemes have been proposed for draining the "Everglades" in the southern part of the State—a vast mysterious swamp, almost one of the wonders of the world. There, over an area of three thousand six hundred square miles, the water is one to six feet deep, studded with islands ranging from a mere dot in the marsh, to hummocks of hundreds of acres, overgrown with thickets of vines and shrubs. These are astonishingly fertile, and the marsh itself is deep with the richest vegetable and alluvial deposits. If ever drained, this now waste expanse will supply farming-land enough to flood the Northern markets with early truck, and make strawberries and green peas as common and cheap in mid-winter as they are now in summer—as common we may say, as oranges have already become.

A glance at a recent map shows that railways are being rapidly extended through the interior of Florida. These will bring many new trucking regions into quick and easy communication with the shipping points, and very soon they will be about as near New York in point of time and freight expense as was southern New Jersey only a few years ago. Montreal may soon enjoy fresh winter garden products direct from our Southern Peninsula.

TRUCKING ALONG THE ST. JOHNS RIVER.

Drawn and Engraved for the American Agriculturist.

Simple Implement for Squaring Fields.

Mr. Jno. Bartlett, Oshawa, Ont., suggests the following as an easily made contrivance for laying out fields in fencing, plots for plowing or sowing, and for any other purpose where it is desired to run lines at right angles. Take a piece of thoroughly seasoned wood, an inch or so thick, and eight inches or more square, and fit to an inch hole in its center a staff of convenient length, sharpened at its lower end so as to be easily set firmly in the ground. With a square make two lines on its upper side, crossing in the middle at exactly right angles to each other. Then with a sharp, straight, well-set saw, cut grooves, *a*, *b*, about a quarter inch deep, through or alongside of these lines as a guide. These answer to sight through, and an assistant can set up rows of stakes in quite accurate

A SQUARING BOARD.

lines, being governed by a motion of your hand in moving them to the right or left. A convenient method of securing accuracy in sawing the grooves, is to fasten the board in a work bench or other vise, together with a thin, straight edge along the mark, to run the saw by the side of in starting it. A board twelve or fifteen inches square will not be unwieldy, and will secure greater accuracy by affording longer grooves through which to sight.

Improved Well Windlass.

As ordinary pumps draw water only thirty-three feet perpendicularly, and practically only about thirty feet from the water surface, force-pumps are required, or a windlass for wells thirty or more feet deep. The common windlass with stop ratchet served a fair purpose, but requires one to let the bucket all the way down by turning the crank backward. Various forms of brakes have been devised. Mr. Snook sends one form which is here

AN IMPROVEMENT IN WINDLASSES.

presented, with several alterations, such as to secure the brake pressure by weight rather than lifting, and to have the lever arm out of reach of a blow from the crank, also a means of securing the brake when leaving it to handle the bucket. The illustration shows the construction and operation. Two opposite corner pieces, *p*, extend six feet high above the platform, and a diagonal piece connecting their upper ends, supports a grooved pulley carrying the lifting rope. A hook *h*, turning on a pivot, is thrown over the lever *b*, and slid along it far enough to hold the brake against the windlass firmly when the hand is removed. A swinging

iron rod catches in the small pin on the top of the bucket as it rises, and tips the water into the spout. With these little additions, we prefer a windlass and bucket to a pump, as the water is drawn fresh, with no tainting from the pump log. Ordinarily one must draw out all the water standing in the pump tubing, before getting that which is cool and fresh—a considerable waste of power. The actual force required to raise the same water is less with the windlass than with the pump, as there is less power wasted in the friction of the close fitting valves of the pump, and the friction of the water against the side of the tube.

Have Many More Things Early.

Not one farmer or village plot owner in a hundred yet understands how very easy it is to have plenty of early vegetables, green peas, corn, potatoes, etc., with a variety of early flowering plants. After long deprivation of fresh garden products, every week gained in spring and summer is so much added enjoyment, and is health-promoting—moreover, any enterprising man living accessible to a village or two will find large profit in being ahead in the market, since, as with early spring lamb, those first offering fresh garden products, peas, corn, radishes, lettuce, beans, beets, tomatoes, etc., etc., will realize two, three or fourfold the ordinary prices. An instructive illustration was that given by a farmer in Eastern Iowa, who, pointing to his excellent farm with fine buildings said the *American Agriculturist* in effect gave him these, as it led him to go into this early culture, and the extra profits largely paid for both farm and fixtures. Many others can give similar illustrations.

Hot-beds are very good helps, but they are a bugbear to many, simple and easily managed as they are, and they are not essential. Mr. Andrews' method, (see Feb. No., p. 65,) is very good. The cheapest method for ordinary, and especially for larger operations, is the following: Procure a full supply of good sods, two to four inches thick, when practicable cutting off an inch or so of the grass side with a sharp spade. Select the southerly or southeasterly side of a board fence, and place boards along its bottom to shut off cold northerly winds, or loose straw piled along its colder side will answer well. In lieu of a fence, boards set on edge a little leaning against a row of stakes furnish a good wind break, and are even better than a fence as one can work over the top of them.—Lay along the sunny side of the boards or fence a bed of the sods grass side down, two to four feet wide, packing them firmly upon the previously cleared ground surface. If the sods are not a rich mould, and even if they are, it will be an advantage to sprinkle or wet them with liquid manure dipped from a low place in the barn-yard, or that made by partly filling a barrel or cask with manure from the horses or cattle heaps, and filling with water, stirring and then dipping it out, or drawing it from a plugged hole at the bottom.

Now, with a sharp spade or other thin implement cut through the sod, not disturbing it, but leaving it in squares of various sizes from an inch or two to four or five inches across, and in the middle of each square place a few seeds of anything and everything which it is desired to bring forward early, as peas, beans, corn, tomatoes, cabbage, cucumbers, melons, egg plants, etc., etc., and of various flower-seeds if desired. Potatoes cut in suitable sizes, or small whole ones, can be placed in the larger squares. All the above can be done quite rapidly, and as soon as the snow is off. It would have been better to have had the sods cut in the autumn and piled up with leaning boards over them to shed rain; but when not done the sods can be gathered as soon as the surface frost is out. Sheltered from the colder winds and exposed to the sun, the seeds will vegetate and get the roots well started in the sod. If a freezing night is approaching cover the sods with boards, or throw on a layer of loose straw when the plants are above ground. Whenever the open ground is warm and dry, and danger of frost is over, these sod pieces are to be set in hills or rows. The growth will go

right on rapidly with a full month or more of time gained, as few plants vegetate and extend their roots beyond the diameter of the sods within a month from the time of sowing.

The cost and profit are easily seen and estimated. A bed of sods a yard wide and only four rods long will furnish nine thousand five hundred and four squares, averaging three inches across, or about exactly enough to plant two full acres with hills three feet apart each way in the rows!

Bitting Colts.

A colt should be thoroughly fitted, that he may not be awkward and ungovernable. One can always tell by the way a horse carries his head, whether he has been well broken or not. It is very annoying to have a horse throw his head up and down when travelling, or swing it around sideways in an awkward ungainly manner. The contrivance here illustrated, is a most excellent one for bitting young colts before they are broken to harness. The two long crooked pieces, *f*, *f*, are natural crooks of some hard tough wood, finished to two

A DEVICE FOR BITTING COLTS.

inches wide, and one and a quarter inch thick. They are halved together at their intersection, and firmly fastened with four small bolts. A staple *a*, is for attaching the hack strap and crupper. Short straps or cords from the bits are snapped into the staples at *b*, *b*, *b*, *b*, and drawing from different directions, they thus prevent throwing the head about, and gradually induce a uniform habit. The turrets, *c*, *c*, have the lines passing through them as in ordinary harness, and may be taken from any old harness. The girth is attached to the staples *d*, *d*, when using. The four short lines from *b*, *b*, *b*, *b*, must not be drawn in too tightly at first, or the colt will acquire a habit of backing to loosen the strain on the mouth. This contrivance should first be fitted on in the stable or a small yard, allowing the colt to become accustomed to its new outfit, before attempting to drive with the lines. When gently handled, the most wayward colt can be made tractable through the use of this simple arrangement. The under sides of the pieces, where resting on the back, may be padded to prevent any abrasion of the skin. The back-strap, crupper and girth, need to be strong and secure, as they must bear considerable strain when the colt is viciously inclined.

W. D. BORTON.

More Local Fairs Needed.

We have, perhaps, enough of great expositions, national fairs, State fairs, etc., to give vent to the enterprise of the leaders in industry, and as nuclei for the numerous demoralizing side shows that cluster around these larger gatherings. But do we have enough of small local fairs and industrial shows which come within the reach both as to distance and productions of the ordinary farmer and his wife, his sons and daughters? In Great Britain, and especially in Scotland, each neighborhood has its "Poultry Show," or its "Flower Show," to which the neighbors contribute the best samples of their own products, and they stand a chance of being awarded honors which would be

entirely out of their reach at the greater fairs. Every farmer can go and see what his neighbors are doing, and thus an emulation is aroused which the more extensive fair can never awaken. The hard-worked, plodding farmer says he has no time to bother with fairs and prize stock, and choice fruits and fancy flowers, and it is true if he has to compete with persons of wealth and leisure who make these a part of their avocation. But most of ordinary contributors have time and pride enough to keep abreast with those whom they recognize as their peers. While it is neither profitable nor honorable to do anything poorly, every person ought to have something in which he takes especial pride; if a farmer, it may be his horses or his hens, his potatoes, or even his roses; the wife or daughter may excel with her bread, her house plants, or her decorative work. If one has a "hobby" it need not encroach upon the more regular duties and he will be sure to find time for it; he will take as much pleasure in it as in all his other work. He will be furnished with the literature of that subject, and be recognized by his neighbors as an authority and a success in that department, and by this effort will receive a valuable discipline and uplifting of character. He will be able to make that department of the local fair interesting, while he will be the better fitted to contribute to the other departments also. In the British fairs, already referred to, the young men have athletic sports and contests which add interest to the occasion and also stimulate a pride in the manly physique which is much needed by our American youth. Our County fairs do not fill the bill; while important and useful their territory is too extensive, their plan too elaborate, their machinery too complicated and expensive, and their occurrence too rare. The township would be a better division of territory for the gathering we have in mind, or better still, a neighborhood defined by common consent. W. J. M.

Transplanting Boxes.

Mr. L. D. Snook sends us the following: Figure 1 is a common box of any size, four to six inches deep. Thin strips, three inches or so wide, are set in the box, two or three inches apart. Small

Fig. 1.

bits of shingle or pasteboard serve for cross divisions. This may be used for starting seeds, and for carrying lifted plants to be pricked out; the division pieces confine the roots of each plant to its own portion of soil. In figure 2 a bit of shingle, or any thin wood, say four inches long and two and a half inches wide is cut partly through at its middle, dampened and bent to a right angle, as at *a*. A succession of these set in the box keeps the soil in separate masses for removal with the plants. Figure 3 indicates the use of bark rings, which are readily cut from branches or the trunks of trees, of any size desired. These can be set in a box and

Fig. 2.

filled with suitable soil for starting the seeds. By crowding them in they will assume nearly a square form to save space. The interstices are to be filled with earth to keep the whole moist. A sheet of pasteboard can be cut with little waste into pieces like the whole of figure 4, and creased or partly cut through at the dotted lines. When *a, a, a, a* are brought together in the form of a box, *b* is turned

under as a bottom, and set into the large box. When transplanting *b* is dropped down, and the earth with the plant is pushed out into the hill undisturbed. In all these arrangements, as well as with the sod pieces, Mr. Andrews' plan of placing a few inches of fermenting manure underneath will give bottom heat to hasten the germination of seed and growth of plants. It is, of course, important

Fig. 3.

Fig. 4.

in all cases to keep the seed and plant-bearing soil moist, but never wet. This may be done by occasional sprinkling with a fine rose watering pot, or better by keeping the soil below well dampened, so that moisture enough will rise into the sods, or the earth in boxes, by capillary attraction. Boxes holding half a foot of earth or more, below the division cases, will retain and supply moisture.

The Cultivation of Filberts.

A correspondent in St. Louis, Mo., asks us if the English Filbert can be successfully raised in this country, which would be the best State in which to undertake it, and if the shrubs or trees can be obtained here? He states that he "has seen nuts here called filberts which were not half as large as the genuine English nut."—This letter allows us to say a word in favor of a most neglected fruit, the Filbert. It is exceedingly popular in England, where it is also called Hazel Nut, and when "the nut" or "nuts" are mentioned the filbert is the one designated. The small nut mentioned by our correspondent was, no doubt, one of our two native species, the nut of which is very small and thick-shelled with a diminutive kernel. The filberts of the shops are from a distinct species of Southern Europe. In England, where a dozen or more varieties of the filbert tree (*Corylus Avellana*) are cultivated, a very large and popular kind with rough, hairy husks is known as Cobs. From the success shown by a few trials in New York State, there is little doubt that the filbert will succeed in all the Northern States. Our best nurseries keep trees of a few of the best English varieties. The filbert is usually multiplied by suckers, of which it forms a great many, by layers, and sometimes by grafting. Probably our native species would answer as stocks upon which to graft. In the English plantations, where the shrubs for convenience of gathering the nuts are kept about six feet high, the shrubs are planted ten by ten feet apart. The suckers are very numerous and must be cut away, and a round, compacted head formed by pruning.

The Berry Patch.

Former notes upon the cultivation of the small fruits, have been given under "Fruit Garden." Perhaps the very persons for whom they are especially intended—the farmers, thinking they have no fruit garden, have passed them by. By fruit garden, we mean essentially a berry patch. As farmers more than most others deprive themselves of the small fruits, which they might and should have in abundance, we have endeavored to show that their culture is a simple matter. Let the determination once be made to have an abundance of small fruits, all the rest is easy. To make a beginning, unless some friendly neighbor will furnish plants, there must be a small outlay at the start. If only a few plants of each kind of fruit are procured to begin with, these can be increased very rapidly, indeed, some multiply themselves. No investment will bring such a large return in health and family comfort, as that expended for the plants to stock a berry patch. Send to some reputable dealer for his catalogue, make a selection and send the order

early. The express or mail will bring the plants in due time. When the plants come, there must be a place ready to receive them. Select the best land that can be found near the house. It is well to have it in sight, as trespassers will be less apt to trouble it. It would be better to have prepared the soil for the patch last fall, but do it now, rather than to postpone the garden for a whole year. Prepare the soil as well as you know how with the means at hand. This means well-rotted manure, and thorough working with the plow and harrow.

Pruning the Grape Vine.

Mr. W. W. Meech, Vineland, N. J., writes us: Grape vines that have come to a bearing age, may be pruned in such a manner as to be very certain of the results. By examining the vines while they are growing, one can very readily see from which buds of the previous year's growth, have produced the branches that are producing the crop of the current year. This will serve as a guide to the pruning for the next crop, and so on from year to year. Shoots from canes older than the last year, very seldom produce anything but wood, but that wood is all right for a crop the next year. The shoots from the axillary buds, where the new and old wood come together, will hardly ever produce any grapes. The first bud beyond the axil will be found to yield fruit, but the clusters from the next bud, and for several further on, will generally bear the shouldered bunches of the crop. I have found in my experience that six buds on a strong cane, so selected, will generally yield three fine clusters each; and occasionally four. Up to the capacity of the vine, we may look for this number of clusters from the buds of very strong and vigorous canes of the last year's growth. Hence, according to the number of perfect clusters we estimate the vine capable of producing, we can readily select those giving the best promise, and cut all the others off. This plan of pruning greatly reduces the labor as compared with the old method of leaving spurs of one or two buds all over the vine, and gives little wood and many grapes.

Row Planting—Simple Marker.

No farmer or gardener needs to be told of the advantages of having everything possible growing in straight, uniform rows. Aside from the greater convenience in cultivating, hoeing and weeding,

AN EASILY MADE MARKER.

there is profit in giving all plants, including field grain crops, an equal distribution of sunshine, rain and air. This consideration alone is decisive in favor of drilling in all seed, to say nothing of the uniform depth secured. But drill or no drill, a good marker is desirable, and there are many excellent kinds. Here is one sent us by Mr. H. H. Hastings, Corning, Iowa, easily made at home, with trifling expense. The main plank, *p*, about a foot wide, may be of any length from four to fourteen feet or more. Spike or bolt in the center a runner, *a*, and over this two pieces of a form and in a position to receive any wagon tongue available, or the thills of a single wagon if the marker is to be a small one for one horse; make two, four, or six short runners, *b, b*, as desired and cut through each a mortise to receive the plank. This can be held at any distance apart desired by pins, as shown in the engraving. The lower edges of the runners can be made of a form to suit the soil. In light soil with weights on the plank, or the driver riding on it, the marks can be made deep enough to drop in seed of any kind. A plank, fifteen feet long, with two runners on each side, the middle will mark five corn rows three and a half feet apart, allowing a few inches waste on the ends of the plank.

A New Early Raspberry—The Hansell.

The age of a variety of fruit may be said to date from the time it is first offered in the trade by the nurseryman, though the variety may have been cultivated privately for several years. The Hansell was first discovered in an uncultivated place upon the farm of the late J. S. Hansell, in Burlington County, N. J. The character of the fruit attracting the attention of Mr. H., he propagated the plant, and at the time of his death in 1881, had about ten acres of the variety in cultivation. The Hansell was introduced to the pomologists at a meeting of fruit growers, held upon the farm where it originated. Parry, Collins, Moon, Lovett and many others, well-known in small-fruit culture, examined the fruiting plants, and the "sense of the meeting" was expressed as to the good qualities of the Hansell. J. T. Lovett, of Little Silver, N. J., thus summed up his opinion: "The earliest ripening. The most profitable. Large, bright crimson, hardy, prolific, and very firm."

To growers of small fruits, a gain of a few days only in the earliness of a raspberry, is of great importance, as it has a marked influence upon the market returns. The general testimony shows that the Hansell is quite ten days earlier in ripening its fruit than the Brandywine, and other leading varieties, and the fruit brings the highest prices. After earliness, the next most important character is hardiness; it is claimed that the Hansell has never been injured in summer or winter. It will be seen from the engraving that the Hansell belongs with the large varieties, being nearly the size of the popular Cuthbert, while its firmness and color, two important qualities in a market berry, are commended by the commission men. Unlike many new fruits, we are pleased to state that the Hansell has been tested by growing it for market, some six years or more before the plants were offered for sale.

A New Curled Kale.

The varieties of non-heading cabbage called borecole or kale has never become popular with our people; the two or three varieties sold in the markets as "sprouts" and "German greens" are

A NEW KALE.

bought chiefly by Europeans. The plants are hardy, and if sown in early fall they will make their growth and furnish a cutting very early in spring. While we do not regard them as fine for the table as are the Savoy cabbages, they are, after

they have been frosted, superior to any of the solid headed cabbages, being of a fine texture and pleasant flavor. Those who are fond of "greens" will find kale to give an early supply with but little trouble. The market varieties mentioned above are short-stemmed, the leaves forming a tuft close to the ground. There are other varieties (some

THE HANSELL RASPBERRY.

of them known as Scotch kale,) of various heights, from one to two feet or more. The latest variety is one offered this season from France. Its full title translates into "Half-Dwarf Green, Extra-frizzled Kale." The leaves, as shown in the engraving, are crisped and curled to a degree that may well be called "extra." The tall varieties are sown at the same time, and are treated all through the same as late cabbages. The strikingly beautiful leaves might be used for garnishing large dishes the same as parsley: indeed, the plant would be cultivated as an ornament were it not for its associations with the kitchen. Several years ago some ornamental kales were introduced in which the leaves were not only handsomely cut and curled, but had beautiful colors and variegations. While none could deny their ornamental character, and that they were more showy than many "foliage plants," they did not become popular; they were regarded as out of their place. For the same reason the beets with richly colored leaves, introduced later, failed to be appreciated.

A CENTENNIAL COTTON EXPOSITION is announced to be held in New Orleans, La., beginning on the first Monday in December next and closing in May, 1885. The present year being the centennial anniversary of the first exportation of cotton from this country, it is proposed to celebrate it by a "World's Fair." It will, besides cotton, include "all arts, manufactures, and products of the soil and mine." This exposition has the approval of Congress, and will be under the auspices of the National Cotton Planters' Association and the City of New Orleans. The schedule, which shows

a well-considered list, may be had by addressing E. A. Burke, Director-General, New Orleans, La.

A Handsome Native Shrub.—The Button-bush.

After midsummer the globular white flower-heads of the Button-bush are conspicuous in swampy places and on the margins of ponds and other still waters. The shrub has a wide range, extending from Canada to Florida, and westward to Arkansas and Texas. It is six or eight, and sometimes ten feet in height; its usually smooth leaves, on short leaf-stalks, are commonly in pairs on opposite sides of the stem, though they are often in threes. The individual flowers are nearly half an inch long, tubular, and terminated above by four short teeth. The four stamens are attached to the inside of the corolla near its mouth, and do not extend much if any beyond it, while the style of the single pistil is much protruded. The flowers are gathered in very dense clusters or heads, which are remarkably regular in their spherical form. The heads are about an inch in diameter, though they appear larger on account of the protruding styles, which also gives the clusters a lighter appearance than they would otherwise have. The flowers vary from pure white to cream color, finally turning brownish, and are in great abundance. The botanical name of the shrub is *Cephalanthus occidentalis*; the first, or generic name is from the Greek words for head and flower, while its specific name indicates that it belongs to the western world. Having such a wide range it has received other names besides Button-bush; among them Swamp Dogwood, River-bush and Crane Willow. We call attention to this native shrub as one desirable to use in ornamental planting. Some of our most showy shrubs are found growing in wet places, and many hesitate to transfer them to cultivated grounds, thinking they will not endure the change from a swamp to garden soil. This is a mistaken idea. While plants as a rule are injured by removal from a dry soil to a wet one, most natives of wet soils not only survive a change to a dry location, but many seem to like their new conditions and improve under them. The Button-bush readily adapts itself to cultivation, and is especially desirable on account of its blooming in July and August, when few other shrubs are in flower. It is propagated by seeds, by

THE BUTTON-BUSH—FLOWER CLUSTERS AND LEAVES.

layers and by cuttings, but it is easier to transplant thrifty young plants from their wild localities, taking care before planting to trim the top to compensate for the loss of a portion of the roots.

What is Cardoon?

A lady who sees Cardoon in her seed catalogue every year, wishes to know what it is like, and "if it would be worth her while to try it?"—Cardoon is a very large, thistle-like plant. The first year from the seed it makes a tuft of large, handsomely divided leaves; the second year the flower stalk appears, and runs up to the height of six feet, bearing numerous clusters of blue flowers, resembling the heads of a thistle. The leaf-stalks of the first year are the edible portion. After the outer leaves have made their growth, the leaf-stalks are brought together and tied to hold them erect, the whole cluster is then closely wound, beginning at the bottom, with a hay or straw rope, to exclude the

A CARDOON PLANT.

light, and blanch the leaf-stalks. Blanching is sometimes effected by surrounding the plants with straw, placed erect around them, and binding it on. In our only trial of this method we succeeded in blanching Cardoon by surrounding it with very heavy brown paper. The engraving shows the appearance of a cluster after blanching, ready for the kitchen or market. The leaf-stalks are very tender and crisp. They are usually stewed and dressed with white sauce. Those who like Jerusalem Artichokes will probably fancy Cardoon, as their flavor is very similar and also with cheese.

Heavy Manuring in the Garden.

The garden, though a small patch upon the farm, generally an acre or less, if properly cared for will bring more profitable returns than any cultivated fields. All the vegetables and small fruits that can be consumed in a large family, with a surplus for market, can be raised with very little difficulty. It will add much to the health and happiness of the household to have every appetite satisfied with a daily supply of seasonable fruit and vegetables. To do this the garden must have abundant manure. Though other fields lack, give the garden all it can appropriate, for the same reason that the Jersey cow or the best milker has all the food she can digest. The profit is in the surplus feed above what will sustain her normal weight. The garden is to supply the finest products to the table; let the soil have all the fertilizers the plants can make use of. The profit is in their full feeding. Their quality will be better, and the cost at its minimum. The garden is ordinarily near the barn-yard, the pig sty, the hennery, the privy, and the sink drain, and should have the first claim upon every fertilizer made upon the farm; and if that is not

enough add concentrated fertilizers from abroad. It is none too much to fertilize the garden at the rate of twenty cords of well-rotted manure to the acre. Let every plant, tree and shrub in it have enough to eat. Give the garden the first claim upon your compost heaps, and when you have spread broadcast and plowed in all the manure you can afford, do not fail to have a few bags of special manures for top-dressing during the growing season. Full fed plants are far less likely to be hurt by insects than half-starved ones.

Everlasting Flowers—Improved.

Among the "Everlasting Flowers" those most useful to work in with and brighten up large holiday decorations are the Helichrysums. Their flowers are the largest, and are so easily raised, that with a little fore-thought they can be had in abundance. The species first introduced into our gardens (from Australia) was *Helichrysum bracteatum*, and was popularly called "Golden Eternal-Flower." This was before the term "everlasting" was applied to the group of flowers of similar unfading character, and before we had any other color than the original golden yellow. The name given to the genus *Helichrysum* (from the Greek words for *sun* and *gold*), was on account of the rich yellow color of the flowers of this species. Since then various other species have been discovered, and there are now a number of colors besides yellow. The original "Golden Eternal-Flower" was between two and three feet high; while the flowers were brilliant, they were not sufficiently numerous to conceal the coarse, weedy appearance of the plant itself, which on the whole was not ornamental in the garden. Of late years cultivators have succeeded in obtaining white and other varieties of the original, and with the introduction of others, and probably by crossing, there are a number of garden sorts presenting quite a range of colors and shades, including orange, various reds, browns and purples, besides some with two colors in the same flower. Improvements, quite as important as those in color, have been made in the size of the flower-heads, and in the stature and habit of the plants, so that many of them are desirable plants in the border. The engraving represents one of the most recent of the improved varieties of *H. bracteatum*, called "Dwarf Rose," introduced by Villmorin of Paris. The flowers are numerous and large, standing well above the foliage and of a color heretofore lacking. Where it is desired to have as many flowers as possible to dry for winter, the seeds of the Helichrysums should be started in a hot-bed or in the house, and the plants set out when the weather is settled. The flowers (properly heads of flowers), should be gathered when they first open, dried in the shade, and after they are dry, kept from the dust until wanted for use. If it is desired to raise seeds, leave a few of the earliest flowers upon a plant or two. By removing the flowers as they appear, the season of blooming may be prolonged until frost. A number of other everlastings are given in the seed catalogues. We have growing wild two

THE "DWARF ROSE" HELICHRYSUM.

plants, which are known as Everlasting. One of these, the Pearly Everlasting (*Antennaria Margarithana*) if collected early and carefully dried, presents the appearance of the French Immortelles.

The Shape of Vegetables.—The Parsnip.

All our vegetables of which the root is the edible portion are widely different from the same plants in their wild state. In the uncultivated beet, parsnip or other root, the plant expends its first year from the seed in preparing to produce seed again. It forms a tuft of leaves and these are engaged all the first season in storing up in the root a supply of sugar, starch and other nutritive matters to be expended the next year in a rapid growth of flower stalks and flowers, and in the nourishment and perfecting of seeds. But our root crop plants in the wild state have nothing like such roots as are seen in the same plants when cultivated. They store up, when uncultivated, only just sufficient food to meet the wants of the plant the next year. For the use of man this tendency to accumulate food in the root has been developed, and the plant

TURNIP-ROOTED PARSNIP.

taught, so to speak, to provide an excessive amount, to meet our wants in the way of food. In doing this the plant has been given richer soil than it had when wild, and by selecting for seed-bearers the roots showing the greatest tendency to enlargement, we have produced in our cultivated plants roots so enlarged that they would not be recognized as belonging to the same plant as it appears when wild. It is important to keep up the conditions that have produced the present unnatural size of roots, and not only to raise seeds from plants grown in rich ground, but to select roots for seed-bearing that show no tendency to degenerate. The two common weeds, the wild parsnip and carrot, show the effects of a neglect of these precautions, and the reputation of seeds raised by certain growers illustrates the importance of observing them. But size is not the only advance to be achieved and maintained in our edible roots. Shape has much to do with their value. A few months ago we noticed the great improvement within the past few years in the shape of carrots sent to market. Instead of a long, spindling end, they taper slowly and terminate bluntly. Roots of this kind are more easily dug, weigh more to the measured bushel, and are more economical in use, whether in the kitchen or fed to animals. As a globular form—a sphere—contains a greater amount of solid contents than any other, the tendency in the improvement of various roots is towards this shape. The improved ruta-bagas approach a spherical form. Of all the roots grown in the garden the parsnip and salsify are the most difficult to dig. The parsnip, especially, tapers very slowly and has a long, tail-like root which goes far down into the soil. An improvement on the common long parsnip was made by Prof. Buckman several years ago. By starting with the wild parsnip he produced the variety known as "The Student," which tapers very rapidly. The French have for some years had a short parsnip called the "Round," and in English catalogues "Turnip-rooted," though it is much longer than round. Recently the French seed-growers have succeeded in reducing the length still more, and in producing a root of the shape shown in the engraving. This removes the difficulty of digging, and is an improvement over former kinds.

Box Window Garden.

A box easily made, can be so applied to the outside of any window, as to be an ornament, and a constant source of pleasure throughout the summer, and when frosts come, the box may be changed to the inside, and be refurnished, replacing exhausted plants with others, and be a thing of beauty and joy all the winter. Any ordinary box, made or bought for a few cents, of inch boards, a foot or so in width or depth, and as long as the window is wide, can be filled up with little work. It is strengthened by sewing upon all the inside corners, including the bottom ones, pieces of tin cut two inches wide, and bent at right angles, to fit in closely. The bottom rests on the window ledge, and is held from slipping off by a hook from the underside, closing into a ring fastened into the window sill. The outer side of the box is supported by a wire or small chain, running from a ring in each corner up to rings at the sides of the window. Before setting it in place, stain the box in imitation of walnut, or ornament with some simple distinct pattern, with two colors of paint. Brown and white, black and white, or a dull, dark-blue and white, are good. Bright red should be avoided, or indeed any shade of red, as it will not harmonize well with some delicate colored flowers. A bright blue can be sometimes used to advantage,

A WINDOW BOX.

If some regular pattern of floor oil-cloth is used to cover the box, when seen from a little distance, it will appear as if covered with tiles. The box is filled with earth, and such plants as make a good show either of flower or foliage, planted in it. German Ivy and Kendalworth Ivy are good for trailing over the edge. Ferns, some kinds of ornamental grass, geraniums, begonias, callas, verbenas, and the small-flowered petunias, are all desirable. Rose colored and scarlet flowers in the same box do not have a good effect. There should always be white flowers mixed in with bright colored ones, and for these sweet alyssum does well. An excellent plan is to have some of the plants in pots sunk in the earth; then when the plant goes out of bloom, the pot can be removed and another set in its place, without disturbing the other plants in the box. MRS. BUSYHAND.

Home-Made Easel With Paper Rack.

There was one corner of our sitting-room for which there appeared no appropriate article of furniture. Neither table nor chair fitted it. One of the girls suggested an easel, and one of the boys set to work at once to carry out the idea. In a few days the corner was filled with a pretty home-made easel, on which was placed an attractive engraving. Later an ornamental pocket was added, below the cross-piece on which the picture rested, for the reception of newspapers, pamphlets, or music. The easel can be made of pine, and stained either black or walnut brown, then oiled or varnished. Or it may be made of ash, or maple, or other light

wood, and be as simple or elaborate as one's taste may suggest. The pocket can be made and used independent of the easel, and attached to it by screws, or tied on with bright-colored ribbons.

A Word on Cooking.

To say that the happiness of home depends in a great degree upon the cooking, would seem at first to be considering it from a very low standpoint. Yet it is true, and it is also true that in the majority of well-to-do homes this responsibility so important in its consequences is given over to an ignorant, careless and incompetent class. To consult one of this class, in a case of severe illness, would be considered the extreme of foolishness; but not only the health of the body, but of the mind, and morals even, has its foundation in the food which sustains life. Cooking needs an intelligent, cultivated mind to guide the hands quite as much as painting and music. It is one thing to prepare food so carefully that it shall look inviting and be nourishing and digestible; quite another to mix a few ingredients, place them in the oven, or over the stove, which is either too hot or too cold oftentimes, without any interest as to the result. Take one or two common dishes as cooked by ordinary servants, and compare them with what they should be; for instance that much abused dish, "hash." No wonder, as it is brought to the table too often. The odds and ends of meat, left over from many meals, are picked up; some are fresh and some dry, some with tough gristle on, and all chopped together with potatoes (the last perhaps just cooked and hot, which spoils all hashes). It is put into a cold spider, with fat of some kind, and moistened with water, sometimes too much and sometimes too little. When hot it is sent to the table. The real, appetizing hash is something very different and a nice breakfast dish. Water in which meat of any kind has been boiled should be set away to cool, the fat removed and the broth saved for soups, stews and hashes. All gravies should be saved and treated in the same way, and no fat at all left in them. A jar of "Extract of Beef" should be in every house, and if there is neither of the above on hand, a quarter of a teaspoonful of the extract in a half cup of hot water will moisten and flavor the hash, and add very much to its richness. More should be used if the quantity of hash needed is large. Corned beef is always best, but the hash is good when made of cold roast beef, mutton, or fowls. A roast beef bone will often have on it meat enough for hash, when there is not enough for the table in any other form. It should be boiled in a very little water (and the water saved to moisten it) until the meat loosens from the bones; then chopped with twice the amount of cold boiled potatoes, seasoned with salt and pepper and moistened before putting on the fire. The spider with a little butter or beef-dripping in it, should be boiling hot, the hash put on and covered until a light brown crust has formed; then turned over on the platter and served.

The writer once engaged a so-called "professional cook." She came at night and was asked to make an omelet for breakfast. It came to the table cold, and "flat as a pancake," and of course was hard and indigestible. Why? It was overcooked and also cooked before it should have been, for an omelette should be served the moment it is off the fire. Eggs, always cook some after removal from the stove, and should therefore be taken up before they are fully set. An omelet should have the yolks and whites of the eggs well beaten separately, with a spoonful of milk to each egg added, with salt and pepper to season, and just before placing in a very hot spider, which should have a small piece of butter in it, the whites of the eggs should be added to the yolks and milk. They ought not to be beaten in, but dipped through and through the yolks, etc., then poured into the spider, the part which thickens around the edge lifted back to the center in a heap and taken up just before it is all set. If the butter was hot enough it will be a delicate brown when turned over upon the plate for the table. ETHEL STONE.

Table Decorations.

Floral decoration for the table is now attracting a great deal of attention, and florists are exercising their wits to devise something new and beautiful to ornament the "festive board." At a recent Horticultural Exhibition in New York large prizes were awarded for the best designs of this kind. The craze is sometimes carried to excess, but in moderation nothing gives more an air of refinement to a neatly spread table than a few gaily tinted, but not too highly perfumed flowers, as strong odors affect some people very unpleasantly, especially feeble persons, and may completely destroy the pleasure of a meal in other respects perfect.

For lunch parties, and ordinary occasions, low vases, or triangular-shaped flower dishes of spark-

Fig. 1.—DISHES ARRANGED FOR A CENTER PIECE.

ling cut glass, filled with rosehuds, carnations, and violets, set here and there on the table, are exceedingly pretty, and are preferred by many to taller ones, as they less obstruct the view across the board. But for a large dinner-party, a center-piece of fruit and flowers seem necessary. If expense is not considered, a handsome épergne or crystal rose-glass like a large bowl, resting on a circular plate-glass mirror, and filled with fragrant blossoms, is always beautiful; but if neither of these is convenient, an excellent device may be easily arranged with articles to be found in every house. Take a large platter, round or oval, and set an inverted saucer upon it. On this place a glass fruit-dish, and into this two goblets with their feet firmly bound together with ribbon, the lower one being inverted, and the upper standing upright. If preferred a tall slender glass vase may be used in place of the upper goblet. This forms an extempore épergne, and to fill it lay ferns and large leaves

Fig. 2.—CENTER PIECE PARTLY FILLED.

round the edge of the platter, slipping the stems under the edge of the saucer to keep them in place. Heap the plate with fruit, mingling a few flowers, for color. Over the edge of the high dish hang ferns, ivy, or smilax, to trail gracefully down, and fill in with grapes, or any other fruit. Fill the upper goblet with water, and set it in a bouquet, from which droops smilax, or some other creeper to conceal the glasses. You will thus have a graceful and charming decoration for the table.

In cold weather, when flowers are exorbitantly high, and in some places not to be obtained at all, fruit and berries alone can be used. Bright red and yellow apples, and a few grapes, mixed with wild berries and grasses gathered from the fields,

as bitter-sweet, burning-bush, mountain ash berries, and sweet berries, the blue berries of the Virginia creeper, all work in effectively and form very pretty ornaments.—A growing plant, particularly if in bloom, looks very well on a dining table, if planted in a decorated China or Japanese flower-pot.—Small bouquets of choice flowers are frequently provided for the guests, either placed in tiny bouquet-holders, or laid beside each plate. For ladies, the button-hole bouquet is perfect, composed of several flowers tastefully arranged, while each gentleman has a button-hole flower, which differs from the bouquet in being simply a single blossom, like a rose-bud, or tuberose, with a sweet scented leaf for a background. The stems of the flowers should be covered with damp cotton and wrapped in tin foil. Two or three violets and a rose geranium leaf are dropped in the finger-bowls to perfume the water, and be rubbed gently through the fingers. S. A. C.

Dead-Fall for Mice and Rats.

Mr. W. H. Banks, Durham, Iowa, sends us a sketch of a very simple contrivance, which he has found quite effective. The board *p*, or plank if for rats, is held up at one end by two sticks arranged

A DEAD-FALL TRAP.

as in the engraving. A thread *s*, tied to *v* runs loosely through a little staple at *r*; at *b* it is tied into a bit of pork rind or other bait, and another bit of thread tied to the other end of the bait is held fast at *t* by a carpet tack. On nibbling through the bait the string is released, letting the plank fall upon the victim. The same thread will answer for setting the trap several times. Use common linen shoe thread, or a little stronger thread for rats. There is so little apparatus seen, and the whole so open, that the wily rat seldom suspects danger.

Box Clothes-Hamper.

Large covered willow baskets, called hampers, for holding soiled clothes can be bought, but a box for the same purpose can be made at home at a very trifling expense. Any box of light wood, sixteen by twenty inches, three feet high, is a good size. Paint it a light gray or white inside, and carefully remove any projecting splinters that might catch the clothes. Stain the outside in any desired color, varnish afterward. The light portions are the original wood, and the dark stained brown. For a good staining fluid mix burnt umber with boiling vinegar, a small quantity at first, so that more vinegar or umber can be added until a desired shade is obtained, to be ascertained by testing the fluid on a small piece of wood.—The patterns can be drawn on the wood and the staining fluid applied with a brush like paint; or, an easier way is to paste, over all the wood to remain its natural color, strips of paper cut with exact edges, and then brush the staining fluid over the spaces left. The paper is easily removed by moistening it with a little water. After the stain is dry varnish the whole box. Fasten a strip of plain or figured chintz around the top with brass-headed tacks; finish it with a string to draw it close.—Another method is to cover any box of suitable frame and size with chintz or calico, tacked on, or even pasted. In all cases attach a couple of handles on opposite sides, a fourth of the way or so below the top. These may be cheap, metal drop handles, obtainable at any hardware store; or of strong ticking or other cloth covered with the same material as the box; or be cut out of wood and stained, projecting only enough from the hamper to admit the fingers behind them. WESTERN HOUSEKEEPER.

Hints About Making Rag Carpets.

Mrs. May Stuart Smith, of the University of Virginia, sends us the following: Making rag carpets is one of the things that should not be, and doubtless will not be relegated to a place among the lost arts. Such carpets supply to many families comfort that would be unattainable otherwise. If the housewife is too busy to make them herself, there are always poor unhandy women without capacity for higher service, who are very glad to rip, cut and tack pieces together for the smallest remuneration, and at ten cents a pound they can earn some part of their scanty livelihood and are glad to do it, and we are pleased to give them the work. Such carpets turn to useful account many a fragment which would otherwise be thrown away, old furniture covers, garments, etc., without strength enough for any other good purpose. Cotton, woollen or silk, come into play equally well, if they are barely strong enough to be cut and wound into balls. Half an inch wide is the general rule, a little wider if rotten or very thin, and narrower for thick woollen stuff. The narrower they are cut, the further they will go in making length, of course at the expense of thickness. A pound of rags to the yard is the general calculation, though one of the nicest carpets I have seen, was a yard and three-quarters to the pound. For warp, bale cotton No. 6, containing thirty hanks to the bunch, is best, though No. 7 will answer and goes further. The weaver's allowance is two hanks to the yard for nearly yard wide carpet, but two hanks should be allowed for cross threads. Two bunches of No. 6 will therefore make twenty-eight yards of woven carpet, and of No. 7, forty-four yards. Warp doubled and not twisted, will be found to wear best.

Here is an important point for the inexperienced. In weaving, have a shuttle filled with the warp cotton and weave in two threads between the strip of rags. It will greatly strengthen the carpet, and if the warp is of fresh strong cotton, the carpet will wear until you are perhaps tired of it, or rich enough to buy a more costly one. I doubt, however, whether any other carpet ever gives you so much real pleasure as the rag one which was the result of your own contrivance and patience.

To color the warp, divide it into two equal portions, and with a twenty-five cent package of log-wood, dye half black, using as a mordant a little copperas and bluestone. Dye the other half with copperas, afterwards washed out with weak lye. Have it put on the loom in stripes not over four inches wide; check it with the filling as tastefully and systematically as possible to form exact squares with the warp stripes. All the old flannel and white pieces may be put together and dyed to make the carpet brighter. A simple way of dyeing beautiful red colors is to get fifteen cents worth of red aniline from the drug store, tie it in a thin muslin bag, soak it in cold water to be afterwards added to a large kettle of hot boiling water in which a tablespoonful of alum is dissolved. Wet the pieces well and dye as much as your kettle will conveniently hold. This dye will keep and may be used more than once. Green and blue aniline are first dissolved in a little alcohol, and then used the same as the red. In the country, walnut bark and the nut shells, red oak, pine and walnut bark, or sumac berries, are used, in each case dipping the fabrics in lye afterwards to set the coloring matter. Another style of carpet is said to look very well, and is certainly easier to manage, viz.: have no design or stripe or check, but with the warp dyed any good serviceable color, weave in the pieces of all colors sewed together in such a way as to diversify them as much as possible. This has an effect somewhat similar to what is seen in chéne goods.

To Catch Window Drip

As long as it is colder outside than inside the house, moisture will condense on the glass, and frequently run down, staining paper etc. Mr. Benj. F. Gore, Dewitt, Iowa, sends us a sketch of a device which has been effective with him. A strip of galvanized iron or of zinc, three inches wide, as long as

the window-sill, has one edge turned at a right-angle to set under the front edge of the sill, to which it is clamped firmly at each end, by a semi-circular loop of oval half-inch iron. The outer edge of the metal strip is bent downward and

A CATCH FOR WINDOW DRIP.

round as a small gutter, one end a little lower than the other, to cause the water to run off, when it is caught in an oyster can, suspended on a screw.

Care of the Teeth.

While it is a fact that good and bad teeth are largely inherited, yet good ones may soon be injured by neglect. Not only as a matter of health should the teeth be preserved as far as possible, but for appearances. Nothing more detracts from the comeliness of a young man or woman, than the display of teeth yellow and black from neglect; the better looking the person, the more glaring is this blemish. Parents are often greatly to blame in this respect. As soon as a child gets its permanent teeth he or she should be taught to use a tooth brush, with water, at least once a day. This would often save the child from much mortification and perhaps misery in after life. The use of a tooth brush not too stiff, with water simply, morning and night, is all that most teeth require. If tartar collects in spite of this, the use of Castile soap (the white is preferable) upon the brush will generally answer. If something more is needed to keep the teeth clean, prepared chalk is one of the safest tooth powders. Avoid all tooth powders that are at all gritty. Some contain powdered pumice stone, which will remove both the tartar and enamel. In using the brush, it is equally as important to apply it to the back-side of the teeth as to the front, and instead of only moving it across the teeth, a part of the brushing should be from the gums upward and downward, to remove any particles that have lodged between them. Never use a metallic tooth-pick; a sliver of wood is preferable even to the quill so commonly used. Whenever decay is noticed in the teeth, go to the dentist at once.

Toe and Heel Boot-Jack.

Mr. Wilbur S. Sparks sends us a sketch of a Boot-Jack to hold the toe as well as the heel, and describes it essentially thus: Material, inch boards

AN IMPROVED BOOT-JACK.

of hard-wood; end blocks thicker. Top, ten by twenty inches. Right end block, two inches deep; left end, four inches; side pieces sloping to fit. Six inches and eleven inches from left or toe end cut square in seven inches deep. Split out the five by seven inch pieces, and cut heel triangle four inches deep and four inches wide at widest end. Smooth off all sharp edges. If you have a scroll or other narrow saw the cutting may be made with round corners.—To the above we have indicated by dotted lines where a little shelf, *a*, may be placed for a blacking brush, not high enough to obstruct the boot toe; and at *b* a place may be made for holding a small blacking-box.

How Tommy Celebrated the First of April.

BY AGNES (CARR) SAGE.

"It's April Fool's day, hurrah!" shouted Tommy Bangs, springing up in bed, and turning a double summersault over the footboard, endangering his spinal column—unless, as Aunt Selena declares, it was made of India-rubber. But, like many another boy, Tommy seemed to have as many lives as a cat, and now landed on his feet, and proceeded to put on his clothes, with a jig or pigeon-wing between each garment, for he was as fond of gymnastics as jokes. The first of April was a perfect gala day to him, as it gave an implied license to play all kinds of pranks, and to-day he expected to have "a jolly time," as he expressed it. The day was to end up with a party at Carrie Shaffer's in the evening, at which, as the merry little hostess had confided to him over a lump of taffy, there was to be the funniest April Fool supper, with everything a sham, from the cake and candies filled with cotton and pepper to the molasses and water lemonade.

"But will there be nothing at all good to eat?" Tommy had asked in some dismay.—"Oh, yes," replied Carrie; "mother will be sure to have plenty of goodies, to come on, after we have had all the fun we can out of the first course, but you must be sure and not tell a soul, Tommy, or it will spoil the whole thing."—Master Bangs vowed that wild beasts should not drag the secret from him.

So with these pleasing anticipations filling his mind, Tommy, having danced into his jacket and brushed his carrot-colored locks until they stood up like a halo about his comical little freckled face, slid down the banister and commenced the day's campaign by slyly exchanging the contents of the sugar-bowl and salt-cellar, emptying Aunt Selena's snuff-box into the tea-pot; and setting all the clocks ahead of time. Soon after he called to Dinah, the cook, that it was quarter to eight, and Miss Bangs would be down in five minutes. He laughed until tears came, to see how she flew around like a fussy black hen to hurry breakfast on the table.—"Why, Dinah, what makes you so early this morning?" asked Aunt Selena, descending the stairs at the sound of the bell, and holding up her watch, the hands of which pointed to ten minutes past seven.—"Lor sakes, Missus, I frought it was dret'ful late, and been spinnin' round hyere like a chieken wid it's head off. I bieve dem elocks is all bewitched I does; for shore as you live honey, dey's all a strikin' eight dis bressed minute."—"Guess April Fool has been meddling with them," said Tommy, preparing to attack a plate of hot muffins.—"Or a Tom Fool, which is much the same thing," remarked Aunt Selena dryly, while Dinah as she went off to the kitchen to steep some more oolong, muttered, "Dat ere boy am de berry biggest imp dis side o' Dixie, an' I spects he will come to some dret'ful end, shore!"

"There, Thomas, is a ham sandwich and a potato turnover for your lunch," said Aunt Selena, handing the lad a neat package, as he was about starting for school; "and I do beg that you will not go near Robinson's livery stable any more. I don't like the language you hear there, and besides you are so venturesome; one of the horses will surely kick you, and perhaps injure you for life. That black mare of his is very skittish and unmanageable."—"Gentle as a lamb, women don't know nothing about horses," grumbled Tommy ungrammatically, as he pocketed his lunch, and set off on a run for the schoolhouse. "I am sick and tired of bread and ham, and potato pie. 'Pore

trash,' as Dinah says, anyway."—But when, after a morning of rather more bent pins, and paper streamers, than pot-hooks and fractions, he discovered that his sandwich was made of turkey and his turnover of the nicest mince meat, and learned that Aunt Selena could April fool as well as her nephew; although in a much kinder and more satisfactory manner.—"She's a brier, if she does think a fellow is always going to break to pieces, or be kicked over the moon," soliloquised Tommy. But in spite of his gratitude, when school was out, he could not keep away from Robinson's stable, for he thought "the black mare is off in the country to-day, so there can be no danger, and I'm in for the best trick yet, if only Billy the hostler will help me."—So, with his chum, Diek, and his seat-mate, Harry, early in the afternoon he entered the barn where three men were polishing the harness and washing down the handsome earriages.

"Here comes Tom, Diek and Harry," remarked one; "well boys, what's up?"—"Oh! such a lark!" said Diek. "Tom is going to fool his old aunt, so she won't get over it for a week."—"But we want your help, Billy," said Tom, while Harry

.... Oh! art stopped short
At the cultivated court
Of the Empress Josephine,"

warbled Diek. "But I declare, Bill, you seem to be ruining it."—"Don't I look frightful?" exclaimed Tom. "But Aunt Selena's hair won't 'turn white in a single night,' for it's that already. So come on boys; anything for sport."—And Aunt Selena fulfilled the little seapegrace's greatest expectations, for she came rushing from the house, as they entered the gate, screaming, "O! my boy! my boy! It is just what I feared! He has been kicked by the black mare."—"Yes mum," said Diek, "he was quite insensible when we picked him up, but seems to be a coming around now."—"I am so faint, I shall die; I know I shall," groaned Tom, feebly, while his companions shook with inward convulsions, which, however, they hoped Miss Bangs would attribute to fright.—"Bring him right in here," said Aunt Selena, opening the door of the sitting-room, "and Dinah run for the camphor and arnica."—"O! my head! my eye!" moaned Tom, writhing as though in agony; at which Diek and Harry were so overcome with emotion they stuffed their handkerchiefs in their mouths and beat a hasty retreat, leaving their friend to the tender mercies of Aunt Selena and Dinah, who bore him off upstairs, and declared he must be undressed and put right to bed.—Tom now began to think the joke had gone far enough, and jumped up with a hearty laugh, exclaiming, "Don't be frightened, aunty, it was all an April fool."—"An April fool, indeed!" cried Aunt Selena, "with his head all cut in this way! Why! the blow may affect his brain!"—"No, Billy, the stable-man, painted it for fun. See, it will all wash

CARRYING A JOKE TOO FAR.

Drawn and Engraved for the American Agriculturist.

produced from his pocket several cakes of black, blue, and red paint.—"So you want to make Miss Bangs think you were kicked by black Sal," said Billy, when the boys had explained: "That would be a sell; I never set up for an artist afore, but I'll do the best I can for you," and mounting Tommy into the rung of a tall ladder, and watched by the admiring and critical company, Billy proceeded to surround the lad's left eye with circles of black and blue, and to adorn his forehead with a long gash, and drops of scarlet paint to represent blood.—"There," said Billy as he finished and stepped back to survey his work. "Now that's what I call artistic!" and he brought a bit of broken looking-glass for Tom to view the disfigurement.

off," cried Tom.—"Oh, he's quite delirious! quite!" said aunt.—"Crazy as a loon!" ejaculated Dinah, with a roll of her white eyes.—And in spite of the boy's protestations the two women popped him into bed, bound up his head in vinegar and brown paper, and applied mustard to his feet, to draw down the inflammation, while his tears and prayers—for he now began to be thoroughly frightened—only met with, "See how frantic he is getting. I only hope it won't result in a brain fever. Poor boy, how he must suffer! We must call in Dr. Emerson if he is not better soon."

The guests at Carrie Shaffer's that evening watched long and eagerly for Tommy Bangs.—"Hope his head didn't ache so hard as to keep him

at home," laughed Dick; and at length Harry volunteered to run around and see what was the matter.—He returned with his face as broad as a full moon, and between hursts of merriment chuckled out, "I guess Tommy has been caught in his own trap this time, for his aunt just told me he was very ill indeed, in bed, and she should'n't think of allowing him to go out after receiving such a blow."—Poor Tommy, meanwhile, was repenting his foolishness and watering his pillow with great briny tears, and when, at ten o'clock, Aunt Selena came in to inquire how he felt, he threw his arms about her neck, begged her pardon for his disobedience, and promised never to play such a practical joke again. Need I say that Aunt Selena kissed the forlorn little culprit and granted full forgiveness.—"But was it for a punishment," asked Tommy, "that you pretended not to believe me, and plastered me up in this style?"—"Partly, my dear," replied his aunt, with a sly twinkle in her eye, "and also as our April fool."—The next day, Tom, looking very sheepish, said to Dick and Harry that "it wasn't easy to catch old birds with chaff."

AN ILLUSTRATED REBUS.—Some odd-looking lines worth a careful reading by old and young.

The Doctor's Talks.

THE HATCHING OF EGGS.

This is one of the interesting things that come with spring. The awakening of life, in what appears to have no life at all, is wonderful to trace, but it is difficult to observe, and somewhat expensive, especially if spring chickens are marketed. Still something that takes place within the egg, can be shown by engravings, as we shall see presently. Almost as wonderful as the coming of a chick from the egg, is that of the coming of a plant from the seed. I say "almost," because in many seeds you can see a very tiny plant—the beginning of one, while an egg gives no hint that a chick would come out of it. In spring you will find much to interest you in watching the sprouting seeds, and

ALSO LEARN MUCH ABOUT PLANTS,

by observing the different young seedlings and how they appear. When we think of it, what a wonderful thing is a seed! Dry, apparently dead, it may remain lifeless for years, yet treat it properly, give it air, moisture and heat, and in time there will appear a green, living plant! There is nothing in the wonder books to equal it. In observing the different ways in which plants appear from the seeds, you can take up some where the seeds are

too thick, or you can sow seeds in a box. Observe how different the little pea is, from its relative the bean. How different the corn from the pumpkin, often planted with it. Also notice, when very small seeds are sown thickly and too deeply, what a weight of soil the tiny plants will break through and often lift, in order to make their way above the surface. But all of the awakening of plant-life in the spring, is not to be noticed in seeds.

OBSERVE THE BUDS ON THE TREES AND SHRUBS.

How lifeless they seemed all winter. Now, as soon as the warmer days come, they show that they are alive. See how they swell, and soon after throw off the blankets that covered them in their winter's sleep, and the plant that was within them rapidly pushes forth, or it may be a bouquet of flowers appears in full beauty. The shoot that comes from most buds is really a young plant, but growing on a branch instead of in the soil. Notice the different kinds of bud-scales, as the blankets that covered them are called; see how some of these are covered with varnish to keep out the water, and how in some buds a kind of cotton or wool was packed around the little plant to keep it warm. Many other things about the spring life of plants will reward close observation.

"KUT-KUT-KER-DA-A-R-KUT."

from the poultry yard, tells that there is a sprig awakening there also. The laying of eggs and the hatching of them is well known by every boy and girl, to be the spring occupation of the hens. But poor Biddy is likely to be reduced to a mere layer of eggs. She will be deprived of her three weeks of leisure in which she could sit and do nothing but meditate upon the probable number of chicks she would bring off, and be deprived of the pleasures and troubles belonging to her as a mother.

THE INCUBATOR OR ARTIFICIAL HATCHER,

has done this. Artificial hatching has long been practised, but of late, "brooders," or "artificial mothers," have come into use. These are heated by hot-water tanks of galvanized iron, and so useful are they, that one of my friends who hatches his chicks under the hens, as soon as they are ready to leave the nest, takes them from the care of their real mother, and places them under this galvanized iron hen, and finds that they are brought up with much less loss, than by a fussy old hen. Last spring, I amused myself by

PLAYING THE OLD HEN.

That is, I ran an incubator, and hatched out several broods. I did this in order that I might learn the difficulties in hatching by artificial means. But before I talk about the hatching of chicks, let me say that you will find it less difficult, and nearly as interesting, to watch the hatching in eggs of another kind—those of the frog or toad. In shallow ponds and puddles, you will readily find in early spring frog's spawn, or as it is often called, frog's spittle. This is at first in threads, and afterwards in a mass—a clear jelly-like substance, with dark spots all through it, which is the eggs of frogs or toads, for they can not be told apart. If you can find some of the threads or strings, prefer that to the mass, but take home a little, a spoonful of either, and place it in a dish of rain or river water. If you have the *American Agriculturist* microscope, or a magnifier of any kind, you can see what changes take place in the eggs, better than without this help. The mass is a great number of transparent eggs, surrounded by a clear jelly-like substance. The dark spots are the yolks of the eggs, and these are the parts to be observed. Keep the dish, either a saucer or something deeper, in a warm room, and as the water evaporates add more. If you have a microscope, take out an egg or two each day, and examine what takes place in it. You will find that the yolk divides up, first into two parts, then into four, which change their form and size; after a while you can see an imperfect form, something like a tadpole, but all head and little tail. This will increase in size, and eyes will in time appear. Some morning you will find in your dish,

SOME LITTLE SWIMMING THINGS,

which do not look at all like tadpoles, for they are long and narrow, and have some curious things on

each side of their heads. But they really are newly hatched tadpoles, and the appendages of the head are gills. Very few persons know that for a short time after hatching the tadpole has gills, and breathes water like a fish. It soon loses the

Fig. 1.—SECTION OF EGG, BEGINNING OF CHICK.

gills, and ever after breathes air, and must from time to time come to the surface for it. The tadpoles will continue to grow, and if you wish to watch their final changes, in which they lose their tails, and gain their legs, you must keep them in a large vessel of water. If there is a pool near by, you may see these last changes in "wild" tadpoles.

THE HATCHING OF CHICKS.

An incubator, if one can spare the eggs, will allow the progress of hatching to be watched from day to day. An incubator should be so contrived that the temperature can be kept steadily at one hundred and two degrees, and the eggs must have the needed air and moisture. If this heat, and air and moisture are provided, the eggs will have all that the old hen can give them. After the eggs have been in the incubator, or under the hen, for four or five days, it can be told whether they are good or bad, and whether they will hatch or not. If any egg is held up to the light, or better still, if an "Egg-tester" (an affair to allow the eggs to be held up before a candle) is used, and it is perfectly clear, that egg will not hatch. If, on the other hand, a dark spot is seen in the egg, it shows that a chick has been begun. When the contents of a fresh egg are turned out into a saucer you know that there are two distinct parts, the yolk, which is opaque and yellow, and the white, which is transparent. If you look carefully at the yolk you

Fig. 2.—EGG WITH CHICK FARTHER DEVELOPED.

will see a lighter place on it; as the scientific name for this place is a hard one, we will call it "the spot."

THE FIRST SIGNS OF LIFE APPEAR

at this spot. When the eggs have been in the incubator a few days, an artery or two, with blood rushing through it, may be seen, and after awhile a whole network of arteries will appear at the spot, as in figure 1. Some days after the circulation of blood is seen, the beginning of what will become the chick can be made out. It does not (figure 2) look much like a chick at first, but it will take its proper shape in time. A sort of membrane in which the blood vessels first appeared, is spread out over this tiny chick and helps nourish it. The chick has hanging to its lower side a bag, filled with what was a part of the yolk. But we must now leave this chick to grow, and talk more about this matter at another time. THE DOCTOR.

The Young Musician.

"Tu whitt! tu whitt! tu whee! Chick-a-dee-dee! Bobolink! bobolink! spink spank, spink!" and then such a burst of melody, one would have thought a whole aviary of song birds had been let loose in Farmer Milkweed's orchard. Where did it come from? Not from that sancey robin, surely; or the brown sparrow flying home with a worm in her beak! No, indeed; 'tis a rarer songster than either of these—a veritable human mocking-bird—no other than little Patsy French perched on the limb of an old apple-tree; his straw hat pushed

The squaky little iron instrument has wonderful charms for him, and "Like it?" asks the player, twanging out "Yankee Doodle."—"Stunning," is the terse reply. "'Tain't good for much, but yer can have it, if yer choose."—If a gold mine had suddenly opened at Patsy's feet he could not have felt more astonished, or more richly endowed than at this gift, and could scarcely stammer his thanks. What cared he for the scolding he received for loitering, or being sent supperless to bed, when he could creep up in the hay-mow, and there, in the gathering twilight, practice upon his new treasure. That was but the first of many a concert in the old

a professor in a Conservatory of Music, and was touched by the young player. An interview was held with the farmer, and he finally carried Patsy off to his "castle of delight." Years rolled away, but often as a famed musician, he sees again his first audience, the swallows, doves, and mice, listening to the jew's-harp in Farmer Milkweed's old hay-loft.

Our Tame Crow.

A man found a nest of four young ones and was about to destroy them, for though crows on the whole do more good than harm to the farmer, the visible concentrated injury done in a single corn field leaves a strong prejudice against them. But at the request of neighbors in a village near, these nestlings were spared; and after several unsuccessful attempts to destroy the wary parent birds, one of the youngsters was secured by a gentleman in the village and another by the writer, two being killed by accident. The survivors frequently visited each other. The first morning after receiving our pet he seemed quite at home, and rapidly devoured a handful of angle worms as fast as dropped into his open mouth, vociferously calling for more, until he was finally satisfied and contented. He was given a coop, and after a week or so it was left open, but he never left the premises except to soon return. He chose a roost on a tall oak near the house, and at early dawn lighted on the roof and pecked the shingles, and made all the noise possible, as much as to say, "wake up and give me my breakfast." He once came very near destruction when an old turkey gobbler got him under foot, but he was rescued in time; and again when a toddling cousin learning to walk fell upon "Dick," as we called him, and nearly squeezed him to death. When able to fly well he kept out of the way of these and other accidents.

Dick's methods of hiding things was very amusing. After covering a piece of food, for example, he would walk around it, cocking his eye, and if observing an exposed point he would lay a chip over the place, and again walk all around and examine the whole. He followed mother into the cucumber patch and imitated her in picking the fruit. Receiving a sharp rap for so doing he rolled on his back and threw up his claws in his fighting posture. She supposing him dead went on with her work. After sulking awhile he flew off to the fence and sat there angrily muttering curses. Soon after he revenged himself by removing the clothes-pins as fast as she placed them on the line, and letting the clothes fall to the ground, all the while uttering a harsh scolding sound. The old lady by a sudden motion caught and tied him to a stake. But when she was gone he got the string loose, and keeping clear of the clothes-line met us on the way home very cross and surly, but would not go near the house for a long time. A lady of the village having spread some clothes on the grass to bleach, Dick deliberately smeared his feet in a mud puddle and kept tracking all over the clothes until driven away. A neighbor shingling a barn left his knife sticking up in the roof. Dick seized it in his bill and flew off, and only dropped it after long chasing and hurling missiles at him. At another time he took great interest in the building of a boat, and frequently watched the operation. When the painting began Dick was particularly attentive. The man having gone into the shop Dick deliberately walked back and forth from stem to stern, filing the fresh paint with tracks, and then uttered a loud "caw" to call the owner's attention to his mischief. Dodging a stick hurled at him, he flew off in high glee.—Dick often went to the school-house, and lingered around the outside during study hours, but every now and then tapped the window panes, to the amusement of the children but to the disturbance of good order. His wings took him off safely when any attempt was made to punish his intrusion. Numerous thefts in the village were believed to lie at his door, yet he was so adroit and cunning that no one seemed disposed to harm him, and so he lived on in his mischief, until he disappeared one day in late autumn, probably a victim to a sportsman's gun.

MUSIC IN THE HAY LOFT.

Drawn (by W. M. Cary) and Engraved for the American Agriculturist.

back from his sun-burned face, piping forth sweet notes in imitation of the wild birds, that the little feathered creatures come fluttering round, taking him for one of their own. But a gruff bass breaks in upon the liquid treble among the apple-blossoms as Farmer Milkweed shouts, "Pat-sy, Pat-sy, where are you, you young rascal!" and as the bound boy slides down from his hiding-place, "Be off to the store, and bring me a penny worth of nails, in three shakes of a lamb's tail, or I'll make yer sing a different tune from that."—"Yis, sur!" and briskly the bare feet patter down the dusty road.

At the store door he encountered a lad of his own age, who, leaning against a post, is twanging away on a jew's-harp. Patsy comes to a standstill,

loft. There Patsy might be found, actually drawing melody from the second-hand jew's-harp, breathing forth "Robin Adair," "I Want to be an Angel," and "Home, Sweet Home," his only audience the swallows that flitted among the rafters, the brown hen, the comfortable pigeons, and the tiny mice, often rising upon their hind-legs as though about to take the first steps in a minuet.

Then Patsy was happy, in spite of his orphan lot, and hard task-master, while his musical soul overflowed with joy and rapture. A shower one day drove a stranger to take refuge in Farmer Milkweed's barn. He heard the weird strains, stole softly up the steps, and caught a glimpse of the brown-eyed "cherub who sat up aloft." He was

OUR RECORD OF Recent Agricultural Inventions.

Plow.—Geo. C. Avery, Louisville, Ky. Dec. 25; No. 290,959. The object of this improvement is to prevent the breaking of the cap plate of the plow standard by

sudden shocks to the plow. To this end the standard is secured to the socket so as to have a rocking movement in it on the retaining pivot, thus distributing the strain between the socket and the bracing of the plow beam.

Cultivator.—Sharon French, Silver Lake, Kansas. Dec. 11; No. 289,824. This "Lister" cultivator is designed for use in the cultivation of crops planted in a hollow between two ridges. The riding planks *a*, *a*, break the clods and sods on the tops of the ridges, while the knives *d*, and scrapers *f*, loosen the soil and destroy

the weeds on the slopes, the knives are adjusted by means of the arms *g*. The action of the cultivator is outward from the plants, instead of inward as in ordinary cultivators; and is such that the finer portions of the loosened soil are brought back to the plants, while the coarser portions are carried up the slopes, and deposited on the ridges to be broken fine by the clod breaking planks. The construction and operation of the machine are sufficiently shown in the engravings. This cultivator is intended to be used only when the plants are small.

Automatic Vehicle-Brake.—R. R. Pace, Lineville, Ala. Dec. 4; No. 289,698. This brake comes into action the moment the horse begins to hold back. The thills are attached to the front axle by means of shackles, and carry a system of pivoted levers, having brake shoes at their outer ends. When the vehicle runs

down hill and the horse has to hold back, the inner ends of the thills are swung up against the axle, and the brake shoes are pressed against the wheels. If the brake is not to act, as in backing or turning, the braces *j*, *j*, are unlocked from the levers *k*, *k*, and yield so as not to bring the brakes to bear.

Potato Digger.—A. Adam, Reno, Nevada. Dec. 18; No. 290,305. The patented claims of this digger, consist in the means of driving the sifters with a positive motion; in means for adjusting the sifters; and in

the manner of enclosing the gearing. The driving-wheel takes hold of the ground by a portion which projects through a slot in the bottom runner. It has an adjustable bearing, and by the medium of a belt, transmits its motion to the shaft of the sifters. The plow digs up

the potatoes, the side runners *n*, throw them up to the sifters which clean away the dirt, and the screen *o*, gathers them and prevents their scattering. The revolution of the sifters is positive and certain.

Sap Bucket Holder.—J. M. Lance, New Jerusalem, Ohio. Dec. 4; No. 289,662. The holder is a curved wire with hooked ends to catch the bark of the tree. Attachments for supporting and covering the

bucket are also included in the patent. Devices like this, if new, are sometimes valuable properties. The holder, and several ways of using it, are shown in the figures.

Hand Cultivator.—J. H. Thompson, Omaha, Neb. Dec. 11; No. 290,142. This cultivator and its attachments are clearly shown in perspective in the figures. The inventor claims as new, the perforated arm, and the

securing staple *k*, in combination with the cultivator frame, to which the various interchangeable implements may be attached, and so adjusted out of line so as to do work while the operator walks on the undisturbed soil.

Cotton Scraper and Cultivator.—W. C. Thompson, Covington, Ky. Dec. 25; No. 290,814. The knives *a*, one on each side of the machine, are fastened to the vertical braces *b*, and made adjustable both as to height and inclination. The longitudinal braces *c*, are

adjustably attached to the handles and to the knives. The handles are pivoted to the forward end and move up and down in slots in the upright standards *g*, these standards being adjusted to move horizontally in a slot

in the bench. By these connections and adjustments, the distance between the knives can be made to suit the requirements of the ground and the plants, and so that they will not only cut the weeds, but side up the stand at one and the same operation.

Plow Point.—Albert Ball, Canton, Ohio. Dec. 11; No. 289,797. This is a hollow plow point which may be attached and held firmly without the use of bolt or key, and yet readily removed and reversed when worn beveling. The point is made of malleable metal, only the solid edge being hardened. The plow-share point has a

recess, *d*, into which the rear part of *a* is sunk for attachment. The long holes, *a*, allow the depression at *b* to be made without springing the point. When the point is worn the bent part may be sprung out and the piece turned over and re-attached.

Corn Planting Attachment for Plows.—Philip Dougherty, Fort Dodge, Iowa. Dec. 11; No. 290,006. This invention is designed to provide a convenient means for dropping seed corn in hills in advance of a turning plow, and in the furrow previously turned, so that the seed will be covered by the furrow slice as it is turned. The construction is clearly shown by the engraving. As the plow is drawn forward, the revolution of the wheels acting on the connecting bar,

causes the slide, to work the valves in the seed box, so as to drop the seed into the spout. The motion of the vibrating bar, operates the valves, by which the further movement of the seed is controlled. The spout is jointed so as to be adjusted to drop the seed in the outer part of the furrow, so that the plants will come up between the adjacent furrow slices.

Stock Releasing Device.—Wm. Donlon, Eden Prairie, Minn. Dec. 4; No. 289,398. This invention is to be applied to stock barns, and consists of a series of rods, wires, chains, or ropes distributed through the barn, and provided with fusible or burnable parts, to be severed in the case of fire. This system is connected

with proper weights and springs, and also with the doors and the hitching straps of the animals, so that in case of fire, the animals will be set free and the doors opened for their escape. The details of the hitching device and its operation, are shown in the engraving; also a sectional view of a barn, with the system applied.

Steam Plow.—F. Pidgeon, Saugerties, N. Y. Dec. 4; No. 298,554. The engraving shows a longitudinal elevation of the plow, to which Mr. Pidgeon's improvements apply. Their object is to increase the traction of the plow and to facilitate the steering of it. The

plow frame can be propelled forward or backward; the plows at the (for the time) forward end are raised from the ground by means of windlass, *p*, and chain *o*, the bar, *l*, at the other end being lowered so that its plows will enter the ground. The wheels, *a*, grip the ground for traction. The guiding of the machine is effected by winding the chain, *m*, around the shaft, *n*, thus moving one of the bars, *k*, toward the forward end of the plow

frame in advance of the corresponding bar on the opposite of the frame. The plow can be guided from either end, but always by the plows at the rear end. If desired that end of the bar, *l*, farthest from the traction wheels can be raised higher than the nearer end to facilitate steering. The steering can also be facilitated by operating the wheels on that side only of the plow-frame from which the plow is moving.

Plow-Point.—Geo. P. Swift, Columbus, Ga. Jan. 22; No. 292,448. This invention consists in attaching to the front of a plow-point, of any desired

Fig. 1.

Fig. 2.

shape or size, a vertical blade, which is held in place by a fastening bolt having a grooved head to fit over the upper edge of the cutting-blade. A triangular head is preferred.

Cotton, Corn and Tobacco Fender.—M. F. Duncan, and R. E. Doyle, May's Lick, Ky. No. 290,009. This fender is intended to raise the leaves of plants, while soil is being thrown round the stalks by a

plow. Its form and the manner of attaching it are shown in the engraving. The point is slightly curved inward; the rear end curves upward and outward, and carries a hook to remove grass and weeds, and to loosen the soil close to the plants.

Farm and Flood Fence.—A. L. Cottrel, Sidney, Ohio. Dec. 18; No. 290,403. This aims to improve the construction of fences for lands subject to floods. It belongs to the class of fences supported by posts hinged at the bottom, so as to be tilted over by the

current when submerged. The special features of Mr. Cottrel's post are shown in the engraving. He claims the socket as constructed, into which a flat post is inserted and hinged. The twisted bottom-bar *k*, a socketed block secured in the ground to receive the point *g*, and the hooked and hinged brace *l*, supporting the post as shown.

Clover-seed Harvester.—H. H. Spears, Paris, Ky. Jan. 22; No. 292,377.—The object of this invention is to improve the means of raising, lowering and inclining the bed of a clover-seed header. The toothed por-

tion of the header is not shown in the engraving. The invention claims the combination of the frame *a*, mounted on wheels, the cross shaft *j*, provided with a sprocket wheel *h*, on each end, the suspension chain *e*, the slotted guides *g*, the body *c*, the lever *h*¹, rigid on the shaft, and the lever *k*, loose on the shaft. The rock-shaft *n*, and its connections, and the suspension rods *p*. The operation of these parts will be readily seen from the engravings.

Baling-Press.—C. C. Warren, and W. H. Oliver, Beauregard, Mich. Jan. 1; No. 291,489.—The inventors' aim is to provide a simple, easily made, portable and

compact press for baling hay, cotton, moss, and other fibrous material. The figure shows the construction clearly. The patent covers the compound lever, comprised of the parts *f*, *h*, *b*, *p*, and the driving wheel with its connections.

Centrifugal Creamer.—W. C. L. Lefeldt, Schoeningen, Brunswick, Germany. Jan. 29, '84; Nos. 292,661, and 292,662.—These patents cover improvements in the process and means of separating cream from milk

by centrifugal action. The cream is now withdrawn from the milk by a continuous process, the feed of fresh milk, and the discharge of skimmed milk going on at the same time. The engraving shows a longitudinal central section through the most approved form of apparatus, the vessel rotating on a horizontal axis while the cream is skimmed off at one end, and the

skimmed milk removed at the opposite end, the fresh milk being supplied through the axis at the creaming end. There are other forms of apparatus, which are operated vertically; and others open at the top and of simpler and less costly construction. In the engraving, *g* is the inlet pipe for new milk, *d* the outlet pipe for cream, and *h* the outlet pipe for skimmed milk.

Combined Seeder, Plow, and Harrow.—F. S. Armstrong, Secor, Illinois. Jan. 1; No. 291,125. The engraving shows a sectional elevation through the middle from front to rear. The T-shaped frame *d*, *e*,

is supported by the driving-wheels *h*, *h*, and a guiding-wheel *g*. The shaft of the front wheels operates the mechanism of the seed-hox *a*. The plow-frames are pivoted to the bar *d*, as also are the harrow frames *c*. The machine is guided by the wheel *g*, and the lever *g*². The plow and harrow parts may be used separately or together. The claims of the patent cover the parts named, with their connections, the lifting levers and notched bars *b*² and *e*² and the seat.

Corn-Planter.—W. G. Selby, Princeville, Ill. Jan. 1; No. 291,093.—The claims of this patent cover the pivoted frame *f*, *f*², in combination with the supporting

wheels, having bearings such that when the driver rests his weight on the free end *f*, the planter is raised out of the ground, and supported on the wheels; also the construction of the seed-hox *a*, the spouts *b*, the shoes *s*, having an adjustable gauge-plate and packer *p*, *p*, the seed-dropping disk *j*, and its operating mechanism.

Fence-Post.—Fannie S. Smith, Topeka, Kansas. Jan. 15; No. 292,141. This improved fence-post is made out of strip iron, bent as shown in the engraving.

ings, and notched and pierced for hindering wires and fence wires. The construction is extremely simple and cheap, the disposition of the parts being such as to secure stiffness with economy of material.

Butter Buyers

everywhere are refusing to take white, lardy looking butter except at "grease" prices. Consumers want nothing but gilt-edged butter, and buyers therefore recommend their patrons to keep a uniform color throughout the year by using the Improved Butter Color made by Wells, Richardson & Co., Burlington, Vt. It is the only color that can be relied on to never injure the butter, and to always give the perfect color. Sold by druggists and merchants.

Alley's Early Deep Head Cabbage.

Every one, who has raised that magnificent cabbage, the Fottler or Brunswick, has regretted that so fine a cabbage did not make a thicker head. The Alley Early Deep Head is the successful result of years of careful selection and high cultivation, to obviate these defects. As early as Fottler, it is as large, is thicker and heavier bulk, for bulk, and brings more in market than any other drumhead. **PERLITA**, 25 CTS. **PERLITA**, 25 CTS. **Early Etampes Cabbage** (new) earliest of all, 10 cts. per package. **Guerrande Carrot**, (new) remarkably thick at the neck, per packet, 10 cts.; per oz., 30 cts.; **Perennial Onion** (new) lives in the ground without protection all winter, and is ready for use weeks earlier than any other kind, per pkt., 15 cts.; per qt., 80 cts.; **Solid Ivory Celery**, (new) nearly self-blanching, per pkt., 15 cts. **White Bonniel Cucumber** (new), a mammoth white variety of extraordinary diameter, per packet, 15 cts.; **Dwarf Green Early Lettuce** (new) from France, per packet, 15 cts.; **Banana Melon** (new), it resembles in color and form a huge banana, and has strikingly the same fragrance; per packet, 15 cts.; **Kentucky Wonder Pole Bean**. I have not found in 60 varieties one so prolific, a capital string bean; per packet, 15 cts. **Marblehead Early Horticultural**, probably the earliest of all beans, and yet a true horticultural! per packet, 15 cts.; per quart, 80 cts. **Marblehead Early Sweet Corn**. The earliest of all, giving growers a complete monopoly of the early market; original stock, per packet 10 cts.; per quart, 60 cts. **Sea Foam Cauliflower**; decidedly the finest variety of all; per packet, 50 cts. To those taking the entire collection, I will present a copy of either one of my four books, on the raising of Onions, Cabbages, Squashes, Mangold Wurtzels and Carrots, the purchaser to make the selection.
 I offer **\$1,000.00 in Premiums**, for Vegetables raised from my Seed. SENT FREE TO ALL.
FLOWER SEED. I offer one packet each, of choice mixed selections, from the following varieties, for 40 cts.: Asters, Balsams, Nasturtiums, Drummond the retail price of which would be 90 cts.; Asters, Balsams, Nasturtiums, Drummond
JAMES J. H. GREGORY, Marblehead, Mass.

IF YOU PLANT SEEDS IT WILL PAY YOU TO GET

SMITH'S ILLUSTRATED SEED CATALOGUE
 Beautifully illustrated, 100 pages. Full directions for planting, culture, &c. I do not agree to send a package worth \$3 or \$4 for \$1, but you will get just what you want at the very lowest price consistent with real value. My name is so well known to most planters of Flower, Field and Garden Seeds, I feel confident that I shall be favored with your inquiries.
WM. H. SMITH, Seedsman
 (Late of firm H. A. DREER.)
1018 MARKET ST., PHILAD'A.

Our Superior Strain of Seeds, Sold under our mark O. K., are gaining friends everywhere, and **GARDENERS WHO KNOW THEM WILL HAVE NO OTHERS.**
 Smiling harvests result where O. K. Seeds are planted. Our large, new CATALOGUE is a beautiful book and very valuable. Free to those who expect to buy seeds; to all others 6 cts. Send for it. It will save you money.
J. A. EVERITT & CO., Watsonown, Pa.

CLEMATIS COCCINEA.

This beautiful novelty originated in Texas, and has been thoroughly tested all over the country. It is entirely distinct from all other climbers; grows 12 ft. high, covered with lovely bright scarlet flowers from July to Oct. (a much longer time South). Highly praised by all who have seen it, and offered in all prominent catalogues. Fine plants 2 for 60c, 4 for \$1, by mail. Send M. O. on Troupe. **Order Now.** **GEO. A. LONG, (Troupe Nurseries), Troupe, Texas.**

JOHN SAUL'S

CATALOGUE of New, Rare, and Beautiful Plants for 1884 will be ready in February with a colored Plate. It is full in really good and beautiful plants, as well as all the novelties of merit. My large Seed Catalogue free to all. **JAMES J. H. GREGORY**, Seed Grower, Marblehead, Mass.

BURPEE'S MAMMOTH IRON-CLAD WATER-MELON.

As the Introducers of the now celebrated Cuban Queen, we now bring before the public, for the first time, an entirely distinct and most valuable Water-Melon. Burpee's Mammoth Iron-Clad has such decided points of superiority that it will speedily become a popular favorite with all lovers of fine Melons, while for market it is unequalled. The shape is the most perfect; skin handsomely striped; seeds drab-white. The flesh is particularly beautiful, of a dainty red, and more crystalline than in any other Melon. Of most delicious, rich, sugary flavor, the heart is very large, and the flesh next to the rind is fully equal to the heart in luscious taste. The flesh is never mealy, but always firm, —remarkably solid. Burpee's Mammoth Iron-Clad grows uniformly to a larger size than any other variety known. Under ordinary cultivation we have had hundreds of Melons weighing from 60 to 70 lbs. each, and the entire crop averaged 50 lbs. Very vigorous growth, matures early, and is the most productive variety known. The Melons are truly Iron-Clad, and have frequently been dropped from the shoulder of a man, without bursting. The hardness and tenacity is in the outside

coating or enameling of the skin. Without exception, Burpee's Mammoth Iron-Clad is the best variety for shipping and keeping. 25 cts. per pkt.; 5 pkts. for \$1.00. Each purchaser is entitled to compete for \$100.00 in CASH PRIZES for 1884. **BURPEE'S GOLDEN-HEART LETTUCE**—Entirely new; most attractive, mammoth, firm heads; delicately curled leaves; beautiful golden-yellow color, and remains of superb quality for weeks during hottest weather. Pkt., 25 cts.; 5 pkts., \$1.00. **A REMARKABLE OFFER!** In order to induce thousands of new customers to give our Seeds a fair trial (knowing, from experience, that they then become regular customers), we make the following liberal offer for 1884:—On receipt of only 50 Cents, in Postage-Stamp, we will send one packet each of the two rare novelties above-named, alone worth the price, and also one packet each of Burpee's Netted Gem Musk-Melon, sweet, tender, and a gem indeed; Burpee's Imp. Blood Turnip Beet, best; Etampas Cabbage, earliest; Burpee's Surehead Cabbage, all head and always sure to head; Yellow Danvers Onion; New Red Rocca Onion, immense size, mild; Spanish Monstrous Pepper, large, sweet, red; Hollow Crown Parsnip, improved; Perfect Gem Squash, prolific and excellent; Early Long Scarlet Radish, quick growth; Burpee's Improved Long Orange Carrot, best; Purple Top Munch Turnip, earliest and handsome, and Livingston New Favorite Tomato. The above 15 Packets are worth, Retail Value, \$1.50; but we will send the Entire Collection, by Mail, to any address, for ONLY 50 CENTS, or Five Collections for \$2.50.

FOR ONE DOLLAR We will send above Splendid Collection of 15 Varieties, and ALSO One Packet each of the following: Ultra Sweet Corn, sweetest of all; New Telegraph Peas, immense pods, full of large, luscious Peas; Peerless White Spine Cucumber, none better; Imperial Dwarf Large Ribbed Celery, the best; Burpee's Superior Large Flat Dutch Cabbage, the standard; New No. 2 Cabbage, splendid second-crop; Veltch's Autumn Giant Cauliflower; Perpetual Lettuce, fine; Large Red Websterfield Onion; New Giant Yellow Rocca Onion, of most striking beauty, enormous size, and pleasant flavor; Golden Globe Radish, unsurpassed for summer; Salsify, long white; Spinach, new, thick-leaved, round, and Burpee's Climax Tomato, justly so celebrated.

THE 30 VARIETIES new and choicest Seeds, as named above, amount to \$2.75 ACTUAL VALUE; but we will mail the entire Collection for ONLY ONE DOLLAR. This is certainly the greatest offer ever made by any reliable Seedsmen. All full-size packets, with illustrations and full directions for culture, printed on each. We are ORIGINATORS and not imitators of this plan of placing a valuable Collection of the best Garden Seeds before the public at less than half usual prices. **BURPEE'S SEEDS** are warranted first-class in every respect, few equal, none better, and we are determined to prove their superiority to all who will try them.

\$1000.00 IN CASH PRIZES FOR 1884, to the Growers of the best Vegetables and Farm Products from Burpee's Seeds. Competition open to all. See our Catalogue for particulars. Show this advertisement to your friends and get them to send with you. 8 Complete Dollar Collections (in all 90 packages of Seeds,) mailed for \$2.50. Entire satisfaction guaranteed to every purchaser.

FLOWER-SEEDS **BURPEE'S GEM COLLECTION** of Asters, Balsams, Pansy, Petunia, Phlox, Verbena, Double Zinnia—in all TEN PACKETS—most beautiful varieties, with full directions for culture, for only 25 cts., or 20 Packets Choicest and most Popular Varieties, worth \$1.25, mailed for 50 cts. The 20 Pkts. Flower-Seed and the 50-Cent Vegetable Collection—in all 35 Packets—mailed for One Dollar—less than 3 cts. a Packet. **SPECIAL INDUCEMENT** for readers of *The American Agriculturist*. If you ORDER EARLY, we will send free a copy of **BURPEE'S FARM ANNUAL** for 1884, (price 10 cts.,) 120 pages, hundreds of illustrations, with 3 superb Colored Plates,—the best and most complete Catalogue of the kind. **BURPEE'S ABRIDGED CATALOGUE**, with large illustrated circular of **WELCOME OATS**, mailed free to any address.

W. ATLEE BURPEE & CO. PHILADELPHIA, PA. Warehouses: No. 475 and 477 N. 5th St., & 476 and 478 York Ave.

The Bogus Agricultural Journals.

All persons who in a foolish moment have been persuaded to purchase tickets in the bogus lottery schemes of bogus Agricultural Journals, and who have now become satisfied that they have been duped, will please send their tickets, their circulars and full particulars to this Humbug Department. The Editor proposes to fully ventilate this latest dodge for defrauding farmers, and desires the co-operation of those who have been victimized. We are assured of the aid of the Post-office Department. The scamps will not be able to employ the mails much longer, as the bill shutting them out has already passed the House and will be through the Senate probably this week. President Arthur, who has already taken such decided ground against all lottery schemes, will of course immediately sign this bill, which bars the bogus Agricultural journals out of the Government mails.

Mr. Gaylord, so long the efficient and popular Assistant Postmaster at New York, informs us that the "sample copy" business is to be suppressed. Spurious journals will no longer be able to send out to the rural districts through the mails as third class matter "sample copies" with displayed descriptions of lottery drawings or worthless wares for sale. The act before Congress goes a step further, and says these spurious sheets *cannot go through the mails in any shape.*

Scoundrels to the Back-bone

H. M. Stump, Union City, Ind.—J. Goldsmith & Co., who propose to distribute two hundred and sixty-six thousand dollars cash, in a lottery drawing March 31st, 1884, are scoundrels to the back-bone. Turn to your file of the *American Agriculturist* for 1883, page 205, and you will find a detailed exposure we then made of these chaps who advertised a similar colossal drawing for March 15th, 1883. Continue to send to us all such circulars you receive from the professional rascals who prey upon the farming community.

Justice on Their Track.

The Canadian Parliament has now taken hold of the St. Stephen, N. B., Lottery rascals, whose circulars have been sent to so many of our subscribers, and whose operations have so often been shown up in our Humbug Columns. An Ottawa dispatch informs us that the Attorney General of the Province will deal with the offenders as they deserve. It adds, "No prizes have ever been distributed, and the affair is a gigantic swindle," all of which has been repeatedly said for months by the *American Agriculturist*. These St. Stephen's swindlers having been driven by our exposures from the United States resumed operations in Canada.

The Counterfeit Money Fiend.

That dispenser of the "queer," whose career we have traced and recorded for so many years, and who has been, until now, a peculiarly American institution, has also gone across the border with all his confidential letters, and detailed introductions for the fly to meet the spider at the hotel. The same thousand dollars in bogus money for a hundred in good bills; the same newspaper slips, showing that the counterfeit can not be detected even by experts, all have gone. The Dominion papers give accounts of the introduction of this nuisance that are amusing reading to those of us who have kept the run of this miserable swindle. If we may laugh at the excitement the man with the "queer" has caused, this thing is to be said in favor of the Canadians; the very first "counterfeit money" chap who went over there and set his little trap, instead of catching any victim, was caught himself, and at last accounts was in jail awaiting trial, thanks to the shrewdness of a reporter of the "Toronto Spectator."

What the Chief of Police Says.

Under various names, the art of coloring photographs is advertised as a "nicelight work for ladies and young men at their own homes." One of our subscribers, before he answered the advertisement of a concern in Boston, Mass., took the precaution to make inquiry of the Chief of Police of that City. The note came back in-

dorsed by that official: "Should not advise sending any money." If all who are tempted to invest in doubtful enterprises would be equally cautious, we should have fewer complaints from the victims of swindles.

"The Matrimonial Bureau of Ill."

A subscriber in Lafayette Co., Ark., sends us the "prospectus" of the above named "Bureau," and asks: "What can you say of its reliability?" We only know of the "Bureau," by what it says of itself. It says it was established to "supply a want long felt in the community."—Such things always say that. It adds: "its power for good is simply inexpressible."—but not a word about its power for evil, though when we are told that its founders are citizens of "transcendent respectability," we ought not to think of evil. This Bureau proposes to fit out men with wives, and women with husbands. All can secure the services of this "Bureau," by enclosing an entrance fee of five dollars. Enclose a photograph, together with a three-cent stamp for return answer, and "an answer to the following questions."—The questions are, name, nationality, and a long string of others, including the important one of "means." If one would procure a wife as he would buy a horse or a cow, probably this Bureau might help him. We are so old-fashioned in our notions as to think that love, altogether ignored in this prospectus, should have something to do with marriage. This "Bureau" puts the whole thing down on a trade basis—money down, five dollars. "Compensation for final services to be determined by amount of services rendered, and other considerations germane to the transaction." That last shows, that even in Bureau matrimony, one has, so to speak, "to go it blind," and never knows what it will cost him. The whole thing is too absurd for serious consideration. Those who look upon marriage as a lottery, may take their chances in such a scheme. Those who take a higher view of it, will recoil from any such machinery.

An Old Tune with New Variations.

We have often alluded to the offers to sell counterfeit money as the oldest of swindles. This appeared soon after the first issues of Greenbacks, and has been kept up in one or another form ever since. The latest manifestations of this antiquated swindle, shows an amount of ingenuity that entitles it to a brief mention. A slip with every appearance of having been cut from a newspaper, bears on one side an item from Washington, showing the "Deficits in Uncle Sam's Cash Box," in which is the item: Counterfeit notes received in Redemption Division, \$129,340,00, and losses of packages stolen, etc., to which is added a note that counterfeiting "is reduced to an art," and that "our Treasury officials fail to detect counterfeiters from the genuine, the resemblance is so close." On the other side of the slip is a long letter from Washington, setting forth the loose management in the Bureau of Engraving and Printing, charging that counterfeiters are in collusion with the Bureau, and intimating that duplicate plates from which the notes are printed, have been allowed to go in the possession of counterfeiters, and making serious charges against the whole management of this department of the Treasury. This newspaper slip has every appearance of being genuine. The cutting is carelessly made, showing parts of columns each side of the column containing the items. At the heading, or top of the page, is the running title, "Thursday, June 1, 1882," and on the reverse is the same, "Thursday, June 1, 1882." This shows the thing to be a fraud. Take any New York daily, or other paper that uses these "running headings" at the top of the page—indeed, take this very page. *American Agriculturist* on this page, is, on the next page reversed—that is, *American* on this page, is backed by *Agriculturist* on the opposite page, as may be seen by holding it up to the light. A very ingenious trick, but spoiled by trying to make it too nice. This clipping was sent to a long-time reader, now in Iowa, with the following note, which is such an improvement on the long roundabout letter sheets of former times, that we give it in full:

"DEAR SIR.—Can you use such goods? I will supply you with them if you can. If I have made a mistake in asking the question, say nothing about it, but let the matter drop. I am a friend to a friend, and mean nothing wrong. Don't sign your name to letters, always use No. 1, I will know who it is from. Be sure to return this letter and strip, for I will answer nothing unless they are returned. Yours truly,"

Well James, as we do not advertise in these pages, we will withhold the rest. This pretended secrecy is very amusing.

THE STRANGEST OF ALL IS THIS.

Here is a partner in a large business house in a flourishing Iowa town, to whom this oldest of swindles is entirely new. He in all sincerity asks us to call the attention of the Post Master of New York City to the mat-

ter, that the sender may be apprehended, and adds: "If I can be of any service to you or the Department, please command me," and he does not say, "please don't use my name." Our friend would be less in earnest if he knew there was no counterfeit money in the case, but it is a trap for those who think there is, and are willing to buy and circulate counterfeit greenbacks.

New Benefactors of the Human Race.

For several months there has been an unusual dullness, an entire lack of novelty, in the medical line. At present there are indications of a revival, and we may look for, in nostrums, as in dress goods, new styles suited to the season.

INNMAN HAS RIVALS.

For these twenty years or more the Rev. Innman has had an almost entire monopoly of the free recipe business. His few competitors have been of short duration, and Innman has been left undisturbed to send out his bogus recipe written in a burlesque Latin, and pocketed the dollars for the stuff which could not be procured with the recipe, and which it was never intended should be.

THERE IS NOW A NEW-COMER

in the recipe business; his name it is Laurence, his home it is Brooklyn, and the peculiar infirmity he wrestles with is, Catarrh. The benevolent Laurence quite outdoes Innman, who only sends one recipe; he offers two, and both free of charge. The sufferer, or victim, having received the recipes takes them to the apothecary to have the healing stuff prepared, and is told

THE SAME OLD STORY.

The drugs upon which the invalid had based his hopes of relief, if not of cure, are not to be had. As Betsey Prigg said of Sairy Gamp's Mrs. Harris, "There ain't no sich pussen." The names have no meaning, save to the inventor—they stand for nothing known to science, in fact are made use of "the same with intent to deceive." There are two of these Catarrh prescriptions, one for stuff to be applied to the nose, as a douche, the other to be administered internally. We have room for but the last named, but the other is equally absurd. The recipe is:

Extract Arabian Calla Root.....	1½ oz.
Comp. Tinc. Arabian Red Lava Flower... 2 oz.	
Ferro Citrate Calcium.....	1 dr.
Bisulphate Quinecia.....	4 drs.
Potassi Iodide.....	1 dr.
Phosphic Salicylate.....	1 dr.
Glycerine.....	2 oz.
Verium Ferri.....	I. S. Plat 0. 1.

The educated apothecary or chemist will find much amusement in this attempt to appear scientific.

Of course the maker of that precious prescription knew that it could not be prepared, and the usual sequel follows. He would not have people suffer from Catarrh just because druggists are unable to prepare his prescriptions, so he goes and does it himself, and he informs those who have sent for his free prescriptions that the stuff can be had of him in a box.—"Free, like the prescription?" will be asked. Well, not quite free. A mere trifle of \$6.00 is asked, to cover cost, etc., that's all. It is easy to say that one who has sent to an unknown advertiser expecting to get in return something of value for nothing, deserved little sympathy if he was disappointed. But an invalid will catch at any straw that promises relief, and it is upon this weakness that the quacks trade. One of our correspondents suggests that this free prescription business is open to the charge of obtaining money under false pretences. It does look that way. The offer to send a prescription free, is only a bait to induce people to buy the bottled stuff. The public have had more than twenty years of this nonsense with Innman and still they are ready to run after any new-comers who play the same old trick. Another chap has started in Brooklyn with his

"CONSUMPTION CURED,"

and enred on the same free prescription plan. He is an old physician and he had "some stuff placed in his hands by an East Indian Missionary." It is always a missionary, and he always hails from the East Indies. He "feels it his duty"—they all do—"to make it known to his fellow sufferers." Then follows the offer of a free prescription. It is safe to predict that whoever sends for this, will receive a senseless jargon of made up names, and that an offer to furnish the medicine ready made, at a round price, will follow.

Cautionary Signals.

Bogus vs. Genuine Life Insurance.

Inquiries are made of us concerning a "Mutual Aid Society" in a Western city. Societies called "Mutual Benevolent" or "Mutual Aid" are common in cities, its

members belonging to the same trade or occupation, or drawn together by a common religious belief, and, as a rule, they are very useful. The Society in question appears to be a life insurance company, with a difference. In the regular companies the losses are paid at once from an ample fund, while in the present scheme when a member dies the amount of his insurance is assessed upon the survivors. There is nothing in the prospectus of this Association to show that it is chartered or that its officers give bonds for the proper performance of their duties. The directors may be highly esteemed at home, but they are not widely known abroad, and must not be surprised if people are cautious. To those who ask us about investing in such an Association we say: its safety depends entirely upon the personal character and responsibility of the management, and unless they can satisfy you as to these, wait a bit. There are abundant opportunities for insuring in offices, about which no questions need be asked, as they are as safe as the United States Treasury or the Bank of England. If you wish to insure your life, and too much forethought cannot be exercised in that direction, take out a policy in some such undoubted Company as the New York Life Insurance Company, for example, which has a surplus of more than five million dollars. Do not incur any risks or waste any time with new, untried, or questionable Companies, but insure direct in the New York Life, where safety, reliability and security are assured.

A Car Load of Cattle for a Fat Stock Show.—Eight, ten, and twelve head of one, two, and three year old cattle in this order, have been required to make up a car-load exhibition for a prize at stock shows, but the Illinois State Board of Agriculture has now decided to adopt five head only of all the above ages. We think this a much more reasonable decision, as it accommodates small breeders who often before were not able to make up a greater number, as the owners of a numerous herd could easily do. Now those possessing a moderate number of cattle can have an equal chance with those possessing large herds. Parties of this kind should always be favored as much as possible, in order to encourage and help them in their endeavors to improve, for this is much harder for them to accomplish than the rich, who are overflowing with an abundance.

Everlasting Flowers.—An article on Everlasting Flowers elsewhere (p. 165), has special reference to the Helichrysums. Besides these there are several others well worth cultivating. They have no common names, save the general one, "Everlasting," hence we are obliged to use the botanical names. Among the desirable kinds are *Acerolinums*, with white and delicate pink flowers. *Rhodanthe*, from New Holland, is the most delicate of all Everlastings, and like the preceding, of a charming pink color. *Heliotropium Sanfordii* has small flowers, resembling those of yarrow, but golden yellow. *Xeranthemum annuum*, has large and purple flowers. All we have named belong to the Composite Family. The *Gomphrenas* or "Globc Amaranthus," are often included among the Everlastings. They have small globular heads of various colors, which, if gathered early, are useful for winter decoration.

Nasturtium is the botanical name of a genus of plants, not at all related to the Nasturtium, or "Sturion" of the gardens. Its common name should be "Indian Cress." Its botanical name is *Tropæolum*. The two common species are *T. majus*, a climber, and *T. minus*, a dwarf, bushy sort. These plants are useful and ornamental. The flowers in both are brilliant and showy, while the unripe seed pods are used to make an aromatic pickle. The tall kind is usually grown for its pods, but those from the dwarf species, aside from being smaller, are equally useful. The varieties present numerous colors, for which we must refer to the catalogues. *Tropæolum peregrinum*, on account of the peculiar shape of its flowers is called "Canary-bird flower," and with the tall kind makes an excellent contrast; give these beautiful plants a very rich soil, and sow the seeds or transplant after you are sure cold nights are over.

His Apple Orchard.—"B" writes us: "I have an apple orchard of five acres, set more than twenty years ago. The trees are thirty feet apart, each way. I broke it up two years ago and planted corn each year since; it was well-manured and the sod is well rotted. What is the best thing I can do with it?"—We assume that our correspondent is a farmer. The best thing he can do for his orchard, and for his general farm economy is to sow clover, and convert his orchard into a pasture for his pigs. This will not only produce pork, but the soil of the orchard will be greatly increased in fertility. "B" asks about sowing grain to cut for fodder. By no means; no crop should be grown in an orchard, the larger share of which will be carried off. By pasturing with swine all but a very small proportion of the clover crop will be left upon the soil to enrich it.

FEARLESS.
The only machine that received an award on both Horse-power and Thresher and Cleaner, at the Centennial Exhibition; was awarded the two last Gold Medals given by the New York State Agricultural Society on Horse-powers and Threshers; and is the only Thresher selected from the vast number built in the United States, for illustration and description in "Appleton's Cyclopedia of Applied Mechanics," recently published, thus adopting it as the standard machine of this country. Catalogue sent free. Address MINARD HARDER, Cobleskill, Schoharie Co., N. Y.

U. S. WIND ENGINE & PUMP CO., BATAVIA, ILL.

Stockbridge Manures.**PRICES REDUCED.****STANDARD MAINTAINED.**

The Massachusetts Fertilizer Inspector's
Valuation of **STOCKBRIDGE MANURES**
for the past seven years

Average
\$4.45 per Bag.

The Average Price for 1884 will be \$4.50 per bag, or \$5 a ton less than last year.

In buying a fertilizer, its quality and by whom manufactured should be considered along with the price per ton. A ton of good English hay is considered by most farmers cheaper at \$20 than a ton of bog meadow hay at \$10; and for the same reason the Stockbridge Manures, which are made largely from chemicals, and are very concentrated, are cheaper at the prices asked than many fertilizers at half the price. They have stood the test of the field and State Inspectors for nearly ten years, and have been found the most reliable and richest fertilizers offered in the market. The fact that they have been well made in the past should be a sufficient guaranty of their strength and purity in the future; but, notwithstanding this, we are still under bonds to Prof. Stockbridge to maintain their standard. Send for pamphlet (mailed free), to

FOR THE FARM, GARDEN AND HOUSEHOLD.

JUST PUBLISHED.

Farm Conveniences.

A Practical Hand-Book for the Farm.

Over Two Hundred Illustrations.

Describing all Manner of Home-Made Aids to Farm Work. **NONE OF THESE CONTRIVANCES ARE PATENTED**, and all Farmers can Readily Make Most of them for themselves.

A Manual of what to do and how to do it. Made up of the best ideas from the experience of a large number of practical men. Every one of the two hundred and forty pages and two hundred engravings, teaches a lesson in itself in Farm Economy.

This invaluable book contains simple and clear descriptions of labor-saving devices, for all departments of Farm Work. It abounds in important hints and suggestions, to aid farmers in the construction of these labor-saving devices. The volume is, so to speak, a complete hand-book for doing every day work quickly and readily.

Among the many subjects treated are: Bins for Oats, Fastenings for Cows, Movable Hen's Nests, Management of Young Bulls, Hints for the Work Shop, Boat Building, Business Habits, Hay Racks, Manure, Relief for Spavin, Tool Boxes, Making Hinges, Watering Places for Stock, Shaving Horses, Doors, Ventilating Fodder Stacks, Harrows, Clearing Lands, Feed Racks for Sheep, Troughs, Stalls, Hog Killing, Cements, Improved Dump Carts, Prevent Washing of Hill-sides, Stone Boats, Unloading Corn, Fall Fallowing, Lime and Lime Kilns, Ringing and Handling Bulls, Mixing Cement.

It will be seen from the above that this book covers a large field, and the need of this has long been felt, and it is certain to fill a most important place in the farm library.

CLOTH, 12mo. PRICE, POST-PAID, \$1.50.

New American Farm Book.

Originally by R. L. ALLEN.

Author of "Diseases of Domestic Animals," and formerly Editor of the *American Agriculturist*.

Revised and Enlarged by LEWIS F. ALLEN.

Author of "American Cattle," Editor of "American Short-horn Herd-Book."

For the young man of rural tastes, but without a training at the plow handles, who asks for a general guide and instructor that shall be to agriculture what the map of the world is to geography, it is the best manual in print. For the working farmer, who in summer mornings and by the winter fireside would refresh his convictions, and reassure his knowledge by old definitions and well considered summaries, it is the most convenient hand-book.—*N.Y. Tribune*.

Cloth, 12mo. PRICE, POST-PAID, \$2.50.

Gardening for Young and Old.

The Cultivation of Garden Vegetables in the Farm and Kitchen Garden.

By JOSEPH HARRIS, M.S.

Author of "Walks and Talks on the Farm," "Harris on the Pig," "Talks on Manures," etc.

ILLUSTRATED.

Cloth, 12mo. PRICE, POST-PAID, \$1.25

Feeding Animals:

A Practical Work upon the Laws of Animal Growth, specially applied to the Rearing and Feeding of Horses, Cattle, Dairy Cows, Sheep, and Swine.

By PROF. ELLIOTT W. STEWART.

ILLUSTRATED. PRICE, POST-PAID, \$2.00.

JUST PUBLISHED.

HOUSEHOLD CONVENIENCES.

Fully Illustrated with over Two Hundred Engravings.

A Most Complete Volume, filled with valuable Hints and Suggestions, for doing all kinds of Work in the Household. **NONE OF THESE CONTRIVANCES ARE PATENTED**, and all Housekeepers can readily make them for themselves.

Every House-keeper can save many times the cost of the work by providing herself with a long list of cheap, easily constructed labor-saving devices. The secret of success in house-keeping is knowing how to do things quickly and well. "Household Conveniences" is a key to this secret.

CHAPTER I.—ABOUT THE HOUSE.

Hammocks and Tents, Garden Seats, Window Screens and Awnings, Clothes Lines, Ash Bins and Ash Sifter, Wood Racks, Disposal of House Slops, Crematories, Snow-Plows, Leaches, Lye and Soap, Screens, Carriage Steps, Vines at the Door, Cisterns, Fruit Driers, &c., &c.

CHAPTER II.—THE CELLAR.

The Cellar in General, Musty Cellars, Ventilating a Cellar, Ice Boxes or Refrigerators, Preserving Ice, Meat Safes, Water Filterers, Milk Cupboards, Cheese-Presses, Butter Stamps, Cellar Windows, Coal Bins, &c., &c.

CHAPTER III.—THE KITCHEN.

Flour-Boxes, Spice Boxes, Folding Ironing-Tables, Bread or Kneading-boards, Baking-Tables, Wash Benches, Wash Sinks, Graters and Slicers, Clothes-Driers, Summer-Drinks, Cooling-Frames, Coffee-Mills, Neat Wood-Boxes, &c., &c.

CHAPTER VI.—PANTRIES AND CUPBOARDS.

Chimney and Corner Cupboards, Well Arranged Pantries, Poison Boxes, Store-Room Boxes, &c., &c.

CHAPTER V.—THE DINING ROOM.

Cases for Silver, Convenient Side Tables, Table Decoration, Inexpensive Decoration Generally, Extension Leaf for a Common Table, How to Carve, Fruit Cans.

CHAPTER IV.—THE SITTING ROOM.

Plant Shelves, Rustic Window Boxes, Picture Frame, Vines in the Window, Decorative Art, Flower Boxes, Hanging Baskets, Care of Carpets, Carpet Sweeping, Hat Racks, Stove Pipes, Lamp Shades, Canary Birds, Overcrowded Wood Boxes, Paper Holders, &c., &c.

There are other chapters on the Library, the Sewing Room, &c., &c.—all making the most exhaustive work of the kind extant. This Volume abounds in common sense hints and suggestions from scores of experienced house-keepers, is within the reach of all, and should be a daily consulted work in every home.

CLOTH, 12mo. PRICE, POST-PAID, \$1.50.

Truck-Farming at the South.

By DR. A. OEMLER, of Georgia.

FINELY ILLUSTRATED.

A book for Southern Farmers and Gardeners, and full of invaluable information for those who would engage in a profitable industry.

Cloth, 12mo. PRICE, POST-PAID, \$1.50.

Mrs. Elliott's Housewife,

CONTAINING

PRACTICAL RECEIPTS IN COOKERY.

New Edition. Revised and Enlarged by the Author.

"For intrinsic worth in a bridal gift I would present my daughter with 'Mrs. Elliott's Housewife' in preference to a casket of valuable jewels," was the remark of a gentleman pre-eminent in the capital of his State; and his estimate of the value of this book to all house-keepers is the same as that of multitudes who have known it in former editions.

Cloth, 12mo. PRICE, POST-PAID, \$1.25.

New Edition. Revised and Brought

Down to Date by the Author.

Barry's Fruit Garden.

By P. BARRY.

ILLUSTRATED.

This is the standard work upon the Fruit Garden. It is written from the practical experience of the widely known author, who for more than 30 years has been at the head of one of the largest nurseries in America. It explains all the minutiae of fruit-gardening, and is invaluable to any one who would become fully informed upon the subject of which it treats.

CONTENTS.

PART I.—GENERAL PRINCIPLES.

Names, Descriptions, and Offices of the Different Parts of Fruit Trees.—Soils.—Manures.—The Different Modes of Propagating Fruit Trees.—Pruning, Its Principles and Practice.

PART II.—THE NURSERY.

Soil, Situation, etc.
PART III.—THE LAYING OUT, ARRANGEMENT, AND GENERAL MANAGEMENT OF PERMANENT PLANTATIONS OF FRUIT TREES, SELECTION OF TREES AND VARIETIES, AND PRUNING AND CONDUCTING TREES UNDER VARIOUS FORMS.

Permanent Plantations of Fruit Trees.—Pruning and Training applied to the Different Species of Fruit Trees under Various Forms.

PART IV.—SELECT VARIETIES OF FRUITS, GATHERING AND PRESERVING FRUITS, DISEASES, INSECTS, IMPLEMENTS IN COMMON USE.

Abridged Descriptions of Select Varieties of Fruits.—Gathering, Packing, Transportation, and Preservation of Fruits.—Diseases and Insects.—Nursery, Orchard, and Fruit Garden Implements.

Cloth, 12mo. PRICE, POST-PAID, \$2.50.

DAVID W. JUDD, Pres.

"ACME" PULVERIZING HARROW

AGENTS
WANTED.

It is the best selling
tool on earth.

CLOD CRUSHER
AND LEVELER.

The "ACME" subjects the soil to the action of a **Steel Crusher and Leveler**, and to the **Cutting, Lifting, Turning** process of **double gangs of CAST STEEL COULTERS**, the peculiar shape and arrangement of which give **immense cutting power**. Thus the three operations of **crushing lumps, leveling off the ground and thoroughly pulverizing the soil** are **performed at the same time**. The **entire absence of Spikes or Spring Teeth** avoids pulling up rubbish. It is **especially adapted** to inverted sod and hard clay, where other Harrows utterly fail; works perfectly on light soil, and is the only Harrow that **cuts over the entire surface** of the ground.

We make a Variety of Sizes working from 4 to 15 Feet Wide.

DO NOT BE DECEIVED. Don't let your dealer palm off a base imitation or some inferior tool on you under the assurance that it is something better, but **SATISFY YOURSELF BY ORDERING AN "ACME" ON TRIAL.** We will send the double gang Acme to any responsible farmer in the United States on trial, and if it does not suit, you may send it back, we paying return freight charges. We don't ask for pay until you have tried it on your own farm.

SEND FOR PAMPHLET CONTAINING THOUSANDS OF TESTIMONIALS FROM 46 DIFFERENT STATES AND TERRITORIES.

BRANCH OFFICE: **HARRISBURG, PA NASH & BROTHER,** Manufacture and Principal Office: **MILLINGTON, N. J.**

N. B. PAMPHLET "TILLAGE IS MANURE" SENT FREE TO PARTIES WHO NAME THIS PAPER.

INCREASE THE CROP BY THOROUGHLY PULVERIZING THE SOIL.

Whipple Spring Tooth Sulky and Floating Harrows, Cultivators, &c., &c.

The teeth are arranged to cut and move the earth like so many small plows. Every inch of ground is moved and pulverized five inches deep if desired.

THE "WHIPPLE" HARROW is strong and well made; is adapted to smooth or rough land, and the teeth being independent, adjust themselves to rocky and uneven surfaces. These Harrows accomplish more with the same power than any other Harrow known, and can be used for a greater variety of work.

THE SULKY HARROWS can be adjusted for use as Riding or Walking Corn Cultivators, and when desired Broadcast Grain Seeders are furnished.

Ample time for trial allowed before settlement. Send for pamphlets describing our various styles of Harrows and Cultivators; also the Champion Grain and Fertilizer Drill.

GERE, TRUMAN, PLATT & CO.,
Owego, Tioga County, N. Y.

STROWBRIDGE BROAD-CAST

SEED SOWER

THE BEST, CHEAPEST and SIMPLEST.
Sows all grains, grass seeds, lime, salt, ashes, fertilizers—and everything requiring broadcasting—any quantity per acre, better and faster than by any other method. Saves seed by sowing it perfectly even. Sows single or double cast, all on either or both sides of wagon. Not affected by wind, as the seed is not thrown up into the air. Perfectly simple. Readily attached to any wagon. Lasts a life-time. Can be used wherever a wagon can be driven. Team walking one mile sows four acres of wheat. Crop one-fourth larger than when drilled. Send stamp for circulars giving terms and testimonials. Mention this paper.

New Premiums FOR NEW SUBSCRIBERS.

To any present subscriber to the *American Agriculturist*, who before April 30th this year, sends us one new subscriber, English or German, at the regular price, \$1.50 a year, we will present, post-paid, any one of the following elegant volumes:

Tennyson,	Goethe's Faust,
Burns.	Lucille,
Owen Meredith,	Pope,
Spencer,	Schiller,
Goldsmith,	Goethe's Poems,
Moore,	Shakespeare,
Hemans,	Hood,
Byron,	Cowper,
Milton,	Campbell,
Coleridge,	Pilgrim's Progress,
Wordsworth,	Chaucer,
Scott,	Edgar A. Poe
Mrs. Browning,	Macaulay,

These volumes are well printed, bound in cloth, with the name of the author upon the back.

Here is a great opportunity for securing elegant standard works.

Just look at it for a moment! By spending a comparatively few hours among your neighbors and friends, and securing twenty-five new subscribers for the *American Agriculturist*, you can secure for yourself twenty-five handsome volumes, or a library in itself, delivered to you post-paid. If you wish but one volume, you have but to send one new subscriber; two volumes two new subscribers, and so on.

GET THE BEST

A NEW BUTTER-WORKER

TRY ONE

After three years of practical trial and public endorsement, we offer to Dairymen and to the Trade, our HAND BUTTER-WORKER, operating on the principle of direct

and powerful pressure, instead of rolling, grinding, or sliding upon the butter.

We claim that it is the only Butter-Worker which will certainly, quickly and easily, take out all the buttermilk, and which does not and cannot injure the grain of the butter. It works in the salt as easily and as well.

THE GENUINE

BLANCHARD CHURN

GET THE BEST

Five Sizes made for Family Dairies. Eight sizes for Factory use. We now make both the Round and Square form of Factory Churns. All our goods are of perfect stock and the best workmanship. They are strong, simple, efficient, convenient and durable. The continue to be

THE STANDARD CHURNS OF THE COUNTRY.

Sedgwick Steel Wire Fence

Is the only general purpose Wire Fence in use, being a

Strong Net-Work Without Barbs. It will turn dogs, pigs, sheep, and poultry, as well as the most vicious stock, without injury to either fence or stock. It is just the fence for farms, gardens, stock ranges and railroads, and very neat for lawns, parks, school lots and cemeteries. Covered with rust-proof paint (or galvanized) it will last a lifetime.

It is Superior to Boards or Barbed Wire in every respect. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick Gates, made of wrought-iron pipe and steel wire, defy all competition in neatness, strength and durability. We also make the best and cheapest All Iron Automatic or Self-Opening Gate, also Cheapest and Neatest All Iron Fence. Best Wire

Stretcher and Post Auger. Also manufacture Russell's excellent Wind Engines for pumping water, or geared engines for grinding and other light work. For prices and particulars ask hardware dealers, or address, mentioning paper,

SEDGWICK BROS. Mfrs., Richmond Ind.

AN

UNSEEN WORLD

Revealed to Every Eye.

The unaided eye sees but *very little* of the universe. The telescope brings to our knowledge vast numbers of worlds of the existence of which we

Fig. 1.—MICROSCOPE CLOSED.

should have had no conception, without its aid. There is also all around us a world invisible to our natural eyes; and only by using the Microscope can we see and study its wonderful inhabitants. By this we find that there are myriads of things hidden from us by their minuteness—indeed thousands, if not millions, for every one that is visible.

We find that there are animal forms that move, feed, multiply, and apparently enjoy themselves, yet so small that millions of them gathered in a space as large as a silver dollar, would each have abundant room to sport and play!

Not only are there minute forms of animal life, but there are innumerable plants so small that no

Fig. 2.—MICROSCOPE READY FOR USE.

one is aware of their existence until it is revealed by the Microscope. These Little Things are not only interesting, but to see and know them is of

Great Importance to Us.

The greatest harm to our Crops, our Animals, our Fruits, our Flowers, even to our Bodies, is found to be due to *living* things, both vegetable and animal, so small that they have until recently escaped our knowledge.

Do You Want to See some of these small but wonderfully interesting things? We are now prepared to help every reader of the *American Agriculturist* to some conception of them, to help look a little way down into this unseen world.

The American Agriculturist Compound Microscope.

This was specially devised for the readers of the *American Agriculturist*. [See the March *American Agriculturist*, pages 142 and 143, for full description of this wonderful Microscope, made expressly for us.] This instrument will enable one to examine, and to see very distinctly and clearly, a vast multitude of interesting things, each one a thousand times smaller than the tiniest thing that you can see with the unassisted eyes. This instrument, as you will learn from the description, is accessible to all our readers, either without cost, or at a cost far below anything like it was ever before offered—at a cost so small that if you knew how valuable it is, you would spare no sacrifice or effort to get it immediately.

Not a **Family**, not a **Teacher**, not a **School**, in all the land, should be without one. It would be of more interest to all, and to most people more useful, than anything else they could buy for many times the cost.

How Supplied.

This Simple Microscope is more valuable in the quality of its lenses, its arrangements, etc., than any thing we have ever seen offered for several dollars. Probably its equal can nowhere else be had under four or five dollars. But it will be supplied by us and sent *delivered free* to any part of the United States and Territories for two dollars, and *delivered free* to any actual subscriber to the *American Agriculturist* for 1884, for **One Dollar and twenty-five cents**.

FURTHER.—We will present one, delivered free, and send the *American Agriculturist* to a new subscriber, post-paid, during all of 1884, for two dollars.

FURTHER.—We will present this Microscope to any present subscriber, and **deliver it free** to him, who will send us two new subscribers to the *American Agriculturist* for one year, at one dollar and fifty cents each.

Take Notice ALL Subscribers.

Any person already a subscriber to the *American Agriculturist*, can have one of the above Microscopes delivered free to him for one dollar and twenty-five cents.

First Come, First Served.

The manufacturers who are making these beautiful *American Agriculturist* Microscopes expressly for us, are striving to bring them as near perfection as possible. If some little delay consequently occurs, it will be in the interest of those who are sending for the instruments, since they will be all the better for the longer time employed in perfecting them. We are however entering the names of the applicants for the Microscopes in the order in which they are received, and the Microscopes will be delivered in this order.

As above stated, the March *American Agriculturist* gives very full detailed descriptions of both the Simple and Compound *American Agriculturist* Microscopes, made expressly for us.

Catalogues Acknowledged.

Dealers, more than ever before, add new departments to their business and make it difficult to classify their catalogues. Thus seedsmen include in their lists the ordinary bedding plants and small fruits, while nurserymen generally supply florist's stock. We, as heretofore, enter the catalogues under what appears to be the leading department, and note the others:

SEEDSMEN.

C. E. ALLEN, Brattleboro, Vt.—Small fruits, seeds, and greenhouse and bedding plants.

ALNEER BROTHERS, Rockford, Ill.—A new name, but the firm issues a full and attractive catalogue.

HUGO BEYER, New London, Iowa.—An interesting catalogue with numerous novelties.

BOWMAN & BRECKBILL, Forgy, Ohio.—Fruits and ornamental trees, roses, etc.

H. L. BROUGHTON, Marblehead, Mass.—Price-list of small fruits.

J. A. BUEL & Co., Springfield, Ohio.—Besides seeds with very full descriptions, offer bedding and other plants, implements, etc.

J. G. BURROWS, Fishkill Village, N. Y.—Grape vines, small fruits, Atlantic strawberry, etc.

THOS. A. COX & Co., San Francisco, Cal.—Besides the usual stock many tree, shrub and flower seeds of natives of the coast.

C. W. DORR & Co., Des Moines, Iowa.—Issued as a seed list, but largely devoted to fruit and ornamental trees, etc. Also implements and farm seeds.

EDWARD GILLITT, Southwick, Mass.—List of North American perennial plants, orchids, rare ferns, etc.

THOS. G. HARROLD, Kingston, Md.—Bedding and greenhouse shrubs, etc., with new and beautiful sorts.

A. D. HUSON, Sheboygan Falls, Wis.—Besides vegetables is very full in seeds of wheat and other farm crops.

WM. B. JONES & SONS, Birdsville Seed Farms, Herndon, Ga.—Glad to know that seed-growing is followed in the Southern States. The catalogue includes many farm and garden seeds peculiar to a warm climate.

FRED. N. LANG, Baraboo, Wis.—Besides the useful varieties, a number of specialties of his own.

MICHEL PLANT & SEED Co., St. Louis, Mo.—As ample and as full as usual, not only with seeds, but plants and florist's supplies.

C. F. MILLER, Dundas, Minn.—A special circular relating to Northern cane seed.

J. A. MOODY, Youngstown, Ohio.—Compact, comprehensive, useful.

JOHN R. & A. MURDOCH, Pittsburgh, Pa.—Seeds, greenhouse and stove plants, fruit and other trees, in fact nearly everything that grows and tools to do the work.

PAGE & KELSEY, Des Moines, Iowa.—Greenhouse and other plants, fruit and other trees as well as seeds.

PARKER, GANNETT & WOOD, Boston, Mass.—Includes greenhouse and other plants, fruit trees and shrubs, many implements, etc.

PEARCE, WELD & Co., London, Ont.—Besides the usual vegetable and flower seeds, very full in those of the farm.

A. D. PERRY & Co., Syracuse, N. Y.—Very full, plain and business-like.

ROBT. C. REEVES, 185-187 Water St., New York.—A large catalogue, and about equally divided between seeds and implements.

E. P. ROE, Cornwall-on-the-Hudson.—Small fruits and grape-vines in abundance.

J. B. ROOT & Co., Rockford, Ill.—The business established by the late Mr. Root is kept up to its former high standard by Mrs. Root.

SCHLEGEL & FOTTLER, 26 So. Market St., Boston, Mass.—Very bright and fresh looking, with a long list of novelties and specialties.

HIRAM SIBLEY & Co., Rochester, N. Y., and Chicago Ill.—A list for the trade only.

WM. W. STERLING, Cutchogue, N. Y.—Selected seed corn and other seeds.

L. TEMPLEN & SONS.—Ornamental shrubs, vines, bulbs, and flower seeds.

R. T. THOMPSON, Muscatine, Iowa.—Neat, compact and sensible. Also poultry.

THORBURN & TITUS, No. 158 Chambers St., N. Y.—Crowded full in every department with the newest and best.

ISAAC F. TILLINGHAST, La Plume, Pa.—Contains the novelties besides the usual sorts, and condenses much useful instruction withal.

J. C. VAUGHAN, Chicago, Ill.—A corn and potato manual, with choice vegetable and flower seeds.

W. E. WELD, Ingleside, N. Y.—Descriptive price-list of seed potatoes.

WOODS, BEACH & Co., New Brighton, Pa.—A descriptive catalogue of roses, greenhouse and bedding plants.

NURSERYMEN.

EDWIN ALLEN, New Brunswick, N. J.—General stock of fruit and ornamental trees.

IRVING ALLEN, Springfield, Mass.—Very full in small fruits, including the newest.

H. S. ANDERSON, Union Springs, N. Y.—Trees and small fruits with ornamental stock.

GARRET H. BANTA, Riverdale, Bergen Co., N. J.—A general collection of fruit and ornamental trees and small fruits.

WM. F. BASSETT, Hammonton, N. J.—Small fruits with novelties and specialties in tree fruits.

FRANCIS C. BIDDLE, Chadd's Ford, Pa.—Specially devoted to small fruits with some others.

JOSEPH E. BONSALE, Salem, O.—Greenhouse plants, etc.

JOHN S. COLLINS, Moorestown, N. J.—As usual sends an abundantly illustrated catalogue, with all the desirable new things.

DINGEE & CONARD Co., West Grove, Pa.—A guide to rose culture, very full and richly illustrated.

N. K. EATON, South Sudbury, Mass.—A select list of small fruits.

FRANK FINCH, Clyde, N. Y.—A large broadside list, presenting small fruits, and vegetable and farm seeds.

FRANK FORD & SON, Ravenna, O.—A catalogue of small fruits and seeds. Illustrated.

HALE BROTHERS, South Glastonbury, Conn.—A full list of small fruits with several new kinds.

W. N. HOUGHTALING, Seymour, Conn.—Issues a special circular to describe his new strawberry, Connecticut Queen.

JACKSON & PERKINS, Newark, N. Y.—A special description of the Ohio Black Raspberry.

GEORGE S. JOSSELYN, Fredonia, N. Y.—A large list of grapes. The Fay's Prolific Crenant handsomely figured and advocated.

C. P. LINES, New Haven, Conn.—In a supplementary catalogue figures several recent grapes and other fruits.

WILLIAM H. MOON, Morrisville, Pa.—General nursery stock; very full and abreast of the times.

JOHN PERKINS, Moorestown, N. J.—Both orchard and small fruits, with all the new kinds.

E. H. RICKER & Co., West Elgin, Ill.—Manage to crowd a great deal in a small catalogue.

E. Y. TEAS, Dunreith, Henry Co., Ind.—Very full in all departments and abundantly illustrated.

T. WALKER & Co., New Albany, Ind.—The usual fruits and many flowers.

D. C. WILDEY, Albany, N. Y.—Announces the new fruits, devoting a separate manifesto to each.

STOCK, IMPLEMENTS AND FERTILIZERS.

BOWKER FERTILIZING Co., New York and Boston.—Stockbridge's Manures, and Bowker's hill and drill phosphates, with potash.

R. B. CHAFFIN & Co., Richmond, Va.—A real estate journal, with 600 farms and mills for sale.

CHENEY ANVIL & VISE Co., Detroit, Mich.—Improved anvils and vises.

CHILDS & JONES, Utica, N. Y.—Cheese factory, creamery and dairy supplies.

CLIPPER MACHINE WORKS, Keene, N. H.—Mowers, reapers, and other farm implements.

C-SPRING CART Co., Rushville, Ind.—Illustrated sheet of C-spring carts.

H. P. DEUSCHER, Hamilton, Ohio.—A descriptive list of farm implements.

A. A. & L. H. HALLADAY, Bellows Falls, Vt.—Pure Langshan fowls with prices.

FRANK KNOWLES, Little Hocking, Ohio.—Pure-bred poultry, and eggs for sittings.

LAMB KNITTING MACHINE Co., Chicopee Falls, Mass.—A neat catalogue and price-list.

MATHEWS & SMALL, No. 21 S. Market St., Boston.—Garden seed drills, hand cultivators, etc.

MAYWOOD Co., Maywood, Ill.—Manufacturers of Chicago screw-pulverizer and scraper.

METROPOLITAN AGRICULTURAL WORKS, No. 70 Cortlandt St., N. Y.—Large, fully illustrated catalogue and price-list of farm and garden implements, and fertilizers.

E. C. NEWTON, Batavia, Ill.—An improved animal tie.

L. PENNOCK & SONS Co., Kennett Square, Pa.—A fully illustrated catalogue of scrapers and other road machinery.

E. ROTH & BRO., New Oxford, Pa.—Saw file guides.

RUSSELL & Co., Massillon, Ohio.—A fine list of agricultural implements, and a brilliant cover to the large illustrated catalogue.

ST. LAWRENCE MANUFACTURING Co., Gouverneur, N. Y.—The Corbin Disc-harrow.

MAURICE H. STRONG, Cincinnati, Ohio.—The "perfect hatcher" and "Pacific Queen" artificial mother.

J. J. SYTER, Concordville, Pa.—Wyandotte and Brown Leghorn fowls.

TURNER MANUFACTURING Co., Indianapolis, Ind.—Improved harvester trucks, and binder covers.

Two Excellent Cakes.—The two cakes here described, eaten at the house of a friend, were so excellent that we asked the specifications for the *American Agriculturist*: 1st. For a large loaf, rub to a cream one coffee cupful of butter with two and one-half cups of sugar; then stir well with it one cup sweet milk, four and one-half cups flour, and flavoring to taste. Just before baking mix thoroughly with the above one cup of finely grated cocoanut, the whites of seven eggs beaten to a stiff froth, and three teaspoonfuls baking powder. After baking, frost with the well-beaten white of one egg and sprinkle uniformly over it a cupful of finely grated cocoanut. By using about half a cup more of flour, the above may be baked as a layer cake, requiring, of course, more icing.—2d. Beat the yolks of the above seven eggs thoroughly, add one-half cup butter previously rubbed to a cream with two cups sugar, two-thirds cup milk, three cups flour, three teaspoonfuls baking powder, and flavoring desired. When well mixed, take two-fifths of it and stir into it two or three tablespoonfuls of chocolate previously well dissolved in a little hot water. Bake in two layers, and place between three layers baked from the other three-fifths. Frost with an icing made of one whole egg, a tablespoonful of chocolate, one-half cup sugar, and a little water.

Profitable Employment

FOR

Men and Women, Boys and Girls,

DURING

SPRING AND SUMMER MONTHS.

You can secure valuable Premiums which sell for cash, or make several dollars daily, by canvassing for the *American Agriculturist*. Everybody knows the paper. It is not like canvassing for some new and unknown journal. Nearly every farmer in the United States has at one time or another taken the *American Agriculturist* or seen it in the family. Thousands of our present subscribers write, sending their subscription money, and saying that their father took the paper before them. You can easily persuade those who used to take the paper to take it again, and readily influence persons whose fathers have been subscribers to subscribe themselves.

We offer unusual inducements to canvassers from March 25th to June 25th, inducements such as were never before given to canvassers, and we want a man, a woman, a boy or a girl, in every village in the land, to work for us during the coming three months. Write immediately to us for special and confidential particulars.

We will mail you a full reply the same day your letter is received. Write on paper and not on a postal, directing the envelope to

Canvassing Department,
ORANGE JUDD CO.,
751 Broadway, New York.

Subscriptions can Begin any Time.

Every copy of the *American Agriculturist* is complete in itself. You can therefore have your subscriptions begin with April, instead of January, or with any other month the Subscriber may desire.

The Premium Dictionary

is still presented to every one who sends us a new subscription (at \$1.60).

CRAZY PATCH WORK
How to Make It; how to obtain the silk for it. We send ten samples of elegant silk, all different and cut so as to make one 10-inch block of Crazy Patchwork, for 25 cts.; 12-inch block, 35 cts.; with diagram showing how it is put together.
We send 20 perforated patterns, working size, of birds, butterflies, bugs, beetles, bees, spiders and webs, reptiles, Greenaway figures, etc., etc., and 10 sprays of flowers of various kinds, all for 60 cts., with powder and distributing pad for transferring, to ornament the silk. These patterns can be instantly transferred to any material, and can be used a hundred times over.
Our book, "How to Make Home Beautiful," has instructions for making a variety of patchwork, with diagrams and illustrations of many fancy stitches for joining and ornamenting the silk. Also, has illustrations of all the Kensington and Arasene stitches, with instructions for doing this kind of embroidery and for making many beautiful and useful articles. It also contains a descriptive and illustrated list of nearly 1,000 patterns for various kinds of embroidery. Price, 15 cts. All the above, with ten varieties of silk for 10-inch block, 90 cents; with silk for 12-inch block, \$1.00, with silk for both blocks \$1.25, all post-paid. Silks in \$1.32 and \$5. packages. J. L. PATTEN, 47 Barclay St. New York.

VALUABLE SPRING PREMIUM. A SPLENDID GUN

At a Remarkably Low Price.

The W. Scott, Belgium, Double Barrel Breech-Loading Shot-Gun.

The Barrels of this Gun are of **FINE LAMINATED STEEL** thoroughly tested and finely finished; the action is the **RELIABLE, SAFE AND DURABLE** Lefancheaux Lever Action, that for strength **IS INCOMPARABLY SUPERIOR** to any side lever action now made, and it will outwear a dozen side levers; this Gun has Steel Freed Locks, the stock is solid walnut, oil finished, and full checked; and we can supply either 10 or 12 bores, 30 or 32-inch barrels, and weighs from 8 to 9½ pounds.

This Gun we will supply to the readers of this journal for the low price of \$19.00—not half the usual cost of equally serviceable guns.

We will **PRESENT** one to any one sending 25 subscriptions to the *American Agriculturist*, at \$1.50 a year each.

Express prepaid on this gun to any point east of the Mississippi River, when \$1.00 extra is sent us.

FLAG SPRINGS, Mo., Jan. 8, 1884.

ORANGE JUDD Co.—*Dear Sirs*:—The W. Scott arrived safe and gives good satisfaction. It compares well with Guns of twice its cost. Yours truly, J. M. SHEPARD.

DRIPPING SPRINGS, Texas, Jan. 12, 1884.

ORANGE JUDD Co.—*Gentlemen*:—The parties for whom I ordered the Guns were more than pleased with them. Yours respectfully, J. C. P. McLENDON.

BUTLER, Ky., Jan. 15, 1884.

ORANGE JUDD Co.—*Gentlemen*:—Received the W. Scott Gun in due time; have tested it. Proves to be a strong and accurate shooter. Am well pleased with it. Yours truly, C. A. WANDELOHR.

MURDOCKVILLE, Pa., Jan. 17, 1884.

ORANGE JUDD Co.—Received the W. Scott Gun all right, and am well pleased with it.

Yours truly, A. D. BIGGER.

ATLANTIC CITY, N. J., Jan. 17, 1884.

ORANGE JUDD Co.—*Dear Sirs*:—W. Scott Gun received, and have tried it and report well satisfied.

J. WOOTTON, JR.

COSHOCKTON, Ohio, Feb. 1, 1884.

ORANGE JUDD Co.—*Gentlemen*:—I have tried my Gun with a fine English Gun and a Modern American \$45.00 Gun, and mine does as good work as either of the others. I am well pleased, and can recommend the W. Scott Gun. Yours, E. C. BRYANT.

PROVIDENCE, R. I., March 4, 1884.

ORANGE JUDD Co.—*Dear Sirs*:—I have received the W. Scott Gun you sent all right, and it has proved very satisfactory. I have shown it to a number of my friends, and they all wonder how you can afford to sell so good a Gun so cheap. Hoping to furnish you with some more customers soon, I remain, yours, JAMES ANNIS.

Orange Judd Co., David W. Judd, Pres't.
751 Broadway, New York.

The Scientific Angler.

BEING A

GENERAL and INSTRUCTIVE WORK
on ARTISTIC ANGLING.

By the Late DAVID FOSTER.

Compiled by Lis Scns, and Edited by

WM. C. HARRIS,

Editor of the "American Angler."

ILLUSTRATED.

Cloth, 12mo. PRICE, POST-PAID, \$1.50.

Orange Judd Co. David W. Judd, Pres't.
751 BROADWAY, NEW YORK.

BOOKS FOR SPORTSMEN. FLORIDA,

AND THE

GAME WATER BIRDS

of the Atlantic Coast and the Lakes of the United States.

ILLUSTRATED.

With a full account of the sporting along our seashores and inland waters, and remarks on breech-loaders and hammer-less guns.

BY ROBERT BARNWELL ROOSEVELT.

CLOTH, 12mo. PRICE, POST-PAID, \$2.00.

Every reader of the *American Agriculturist*, who wishes to know about Florida, or contemplates going there, should send for this entertaining volume.

NOTICES BY THE PRESS.

Of great interest to sportsmen.—*Gazette*, Boston.

Conveys information which every sportsman will find practical and helpful.—*Boston Journal*.

The story of the cruise is fresh and fascinating, and the general reader as well as the sportsman will enjoy it.—*Chicago Evening Journal*.

Besides its abundance of facts, the book has a genial but natural air, with a fine taste of out-door life about it, which adds not a little to its value.—*The Times*, Phila.

Tells all that he knows about game water birds, and the most approved and successful methods of shooting them.—Bright and cheery reading.—*Mail and Express*, New York.

Sold at \$2, which is a low price for a duodecimo of 450 pages, unusually handsome and well made. It is a long time since any kind of a sporting book has appeared that seemed to possess so much real value.—*Cultivator and Country Gentleman*, Albany, N. Y.

A full account of the sporting along our shores and inland waters is given in such a captivating manner, that the reader almost imagines himself one of the happy party that made up the excursion.—*The Signal*, Babylon, L. I.

A book of pleasant descriptions of sporting experiences, full of interest and instructiveness in their way, with many particulars in regard to birds of different sorts, their habits, and the way to shoot them.—*Congregationalist*, Boston.

Written in a familiar and attractive style, and will not only interest the "mighty hunters," but our many amateur sportsmen, who find in the gun and reel the best active recreation for the summer vacation.—*Zion's Herald*, Boston.

The contents of the volume fully justify its comprehensive title, while the Publishers, Orange Judd Company, have done their share of the work well, thus making the book attractive as well as instructive.—*The Spirit of the Times*, New York.

Sporting literature receives a valuable addition in the publication of Roosevelt's "Florida and the Game Water Birds of the Atlantic Coast and the Lakes of the United States." The author is an enthusiastic sportsman, and his experience has been a wide one.—*Evening Transcript*, Boston.

Characteristics and habits of game water-birds are given in detail. Game protection is discussed. Guns and rods are treated of at length, and the handling of these is described as carefully as the art critic would exhibit the technique of a work of difficult execution.—*Boston Daily Advertiser*.

The Florida excursion, of which Mr. Roosevelt gives a lively and interesting history, was undertaken with an eye to sport, and exhibits the practical application of a great deal of the technical knowledge set forth in part second. Mr. Roosevelt and a congenial party, including ladies, made a winter trip to Florida in a small yacht, or sharpie, drawing one or two feet of water, and spent a delightful season, hunting, fishing, and exploring in waters, of which the ordinary tourist knows nothing whatever. The descriptions are clear without prolixity, the sporting episodes show the same touch of an expert, the narrative is easy and vivacious, and the whole record is permeated with good humor.—*New York Tribune*.

Complete Manures.

Three Years Trial.

H. T. BAKER & BRO., 215 Pearl St., N. Y.—We have used your fertilizers for corn and cabbage at the rate of 800 lbs. per acre. We had the best cabbage this season, at the time they were marketed, of any in this neighborhood. We also used it on potatoes, alongside of two other kinds, and where your Fertilizer was applied they were one-third better than those raised on other fertilizers. We used your Fertilizer for three years on the same piece of ground. Crops, potatoes and turnips with no other manure. The crop was better this last season than ever before. We also grew the finest carrots on your Potato Fertilizer that we ever raised. We shall continue to use your fertilizer, as we consider it a good thing.

(Continued from last month.)

How Watch Cases are Made.

This process of manufacture was invented by James Boss, who started in business in 1854, and the methods and tools used in making these watch cases are covered by patents. *This is the only watch case made under this process.* For many years the introduction of these goods was slow, owing to popular prejudice against "plated" goods, but gradually the public learned that the *James Boss' Gold Watch Case* was not a cheap gold-washed or electro-plated article, but was made of genuine gold plates of standard quality and thickness. Conscientious adherence to the determination to make the best watch case ever put on the market, and the adoption of every improvement suggested, has made the *James Boss' Gold Watch Case* the STANDARD. In this watch case the parts  most subject to wear—the bow, crown, hinges, thumb-catches, etc., are made of SOLID GOLD.

Send 3 cent stamp to Keystone Watch Case Factories, Philadelphia, Pa., for handsome Illustrated Pamphlet showing how *James Boss'* and *Keystone Watch Cases* are made.

(To be continued.)

Onward.

The host of new subscribers brought by old friends, together with the generous patronage of our advertising patrons, enable us to consummate our most enlarged plans for making the *American Agriculturist* of the very greatest value and interest to every member, old and young, of its great family of readers. As still another step to this end, we make what will be, especially to our long-time friends and readers, a most pleasing May Day

Announcement.

Mr. Andrew S. Fuller, author of "Small Fruits," a long recognized authority on horticultural matters, is hereafter to resume those labors which constituted so valuable a feature of the *American Agriculturist* in former years.

Col. Mason C. Weld, whose name, like Mr. Fuller's, is a household word among the *American Agriculturist's* readers, likewise resumes, with this issue, his "Among the Farmers." He will devote special attention to live stock matters.

Dr. D. D. Slade, the Veterinary Professor of Harvard University, is to write on the various Ailments of Animals, and to hereafter attend to all questions pertaining to such matters. He has no superior in this field, and writes direct from the farmer's standpoint.

Henry A. Haigh, the recognized authority on Farm Law, will discuss and reply to the various legal questions arising among the farmers and farm owners who are subscribers to the *American Agriculturist*.

Robert B. Roosevelt, the genial writer on out-door life for so many years, and the popular author of various books, will entertain and instruct our readers with his pleasant views of forest, field and river.

This strong array of old and new writers, together with our present powerful staff, indicate what the *American Agriculturist* is to be in the future. Beginning with this May issue, we leave each number to speak for itself.

Writers for the May American Agriculturist.

Dr. D. D. Slade, Mass.	Andrew S. Fuller, N. J.
Dr. George Thurber, N. J.	Robert B. Roosevelt, N. Y.

Six Months for 75 Cents.

Beginning with this May issue of the paper, the remaining numbers for the year—seven in all—will be sent to any address for Seventy-five Cents. In order, however, to secure the Premium Engravings, it will be necessary to subscribe for one year, inasmuch as no premiums are given on any subscriptions for a shorter period than a year's time.

No Beginning and no Ending.

But inasmuch as every issue of the *American Agriculturist* is complete in itself, the annual subscriptions can commence now as well as at any other time. Subscribers can begin with any month, and have a complete year from that date.

Amerikanischer Agriculturist.

See elsewhere an important Prospectus of our *Amerikanischer Agriculturist*, of which a specimen copy will be mailed to any Post-office address on the receipt of two two-cent stamps.

GARDEN

AND

Do not plant corn until the soil is warm and settled weather has come. A field planted the middle of April may be less advanced in June than one planted two weeks later. The corn crop makes nearly all its growth within a hundred days, and requires food in abundance and close at hand. Corn responds rapidly to any available plant-food, applied either as well-rotted manure or as a quick acting commercial fertilizer. Soak the seed in tap water and roll in plaster before planting, to keep off the cut-worms. Frighten away crows with bright strips of tin, small clapping wind-mills, and fine twine stretched from pole to pole throughout the field. If the ground is weedy, plant in hills, otherwise drills will be the most profitable. Mangels should be sown this month on rich mellow soil. Other kinds of beets may be sown early next month. Every farm should have a root crop as a part of a rotation. A root crop cleans the land of weeds and furnishes an abundance of food for farm animals. Do not pasture meadows in the spring; this is asking too much of any field. It is cheaper to buy fodder than to rob the meadow. If any tramping of the meadows in early spring is allowed by animals, let it be done by the horses while drawing out a good top-dressing of fine manure. Potatoes should be planted as soon as the soil is ready, and if early sorts are grown, the crop may get ahead of the beetles.

Live Stock Notes.

The work horses need the best of care and an abundance of wholesome food. The shoes may be removed from farm horses if the fields are free from stones. All horse labor should be pushed forward rapidly, so that during the hot weather of next month some leisure may be taken at noonday. Oxen are slow of motion, but most useful for many kinds of farm work. They need considerable time for feeding, and can not be hurried much at their work. Change the cows gradually from dry feed to pasture. Bring them to the stables early, and feed hay with some roots; give dry fodder the next morning before turning the animals out to grass. Calves need special care, as this is the time when "black quarter" and other serious troubles come upon them. Ewes, with their lambs taken from them, sometimes need some of the milk removed from their udders. After shearing, the ticks gather on the lambs, and may be quickly destroyed by dipping in tobacco water or some other effective dip. Tag the sheep before they leave the sheds for the pasture. Pigs thrive with a good run of clover. The orchard is the proper place for swine; they have good grazing and destroy many insect pests. Keep young chickens clean and dry. There is no better place for the coops than in the vegetable garden, where the young chicks will destroy many injurious worms.

Orchard and Fruit Garden.

Trees that have been heeled-in may be retarded by shading them. Planting should be finished as

soon as possible. If the trees have started, great care will be needed in handling them. Such trees should not be trimmed at planting. Grafting for the renewal of old trees may continue, taking great care in cutting away the branches to make no bad wounds, as the bark now peels readily.

Grafting Wax.—Four parts of rosin and one part each, bees-wax and tallow, make a good preparation. If too hard, add more tallow, or if too soft, take less. The best way of using it is upon cloth. Take an old sheet or the skirt of a well worn dress; tear it into strips two inches wide, make the strips into rolls, and let them remain in the melted wax until thoroughly soaked through; remove and let them drain and cool. This waxed cloth may be torn off in pieces of convenient size to cover the wounds, and can be applied to make a complete covering. Squashes are a good crop for a young orchard. Potatoes, mangels, turnips, or other roots may be grown between the rows of fruit trees.

Tent-caterpillars.—If any eggs escaped, their "tents" or webs will soon appear in the trees. Remove them while small. Cureulios attack the young plums soon after the blossoms fall, and the thorough jarring of the trees should begin early.

Mulching is far better than watering to save newly planted trees. Cover the ground over the roots with bog hay, old straw, or litter of any kind.

Strawberries.—Beds that were covered last fall should have the straw left on them until after the fruit is picked. The straw should be pulled away just over the plants. Pull up such coarse weeds as appear through the muleh of the bed.

Watch for the first appearance of holes in the leaves of Currants and Gooseberries, and use White Hellebore dusted on, or better mixed with water, a large tablespoonful of the powder in a pailful of water, and apply with a syringe or pump. Repeat a few days later, to destroy those which escaped or have hatched since the first application.

Young grape vines set this spring, should be allowed to push but a single shoot. If two or more buds were left, to guard against accidents, rub off all but the strongest, and keep the shoot from this tied up to a stake. Rose-bugs destroy the flowers of the grape, shake off these pests in early morning, catching them in a pan in which there is a thin film of kerosene floating on a little water.

Kitchen and Market Garden.

In many places the first of May is moving-day, and many change their place of residence this month. Though it may seem late to begin gardening, seeds sown and plants set out now will come forward with great rapidity, as the soil is now well warmed. Asparagus beds that were planted two years ago may be cut sparingly. Established beds should have every shoot cut, allowing none to grow until cutting stops. If a cold rain comes on, the seed of Lima beans will usually rot in the ground. Examine and re-plant. Weed beets and carrots as soon as large enough, and thin, using the young beets for greens. Keep cabbages and cauliflowers well hoed. Sow seeds for late crops in a seed-bed in open ground. Try some Savoy. Make a small planting of corn as soon as the season will allow, but do not put in the main crop until settled weather. Cucumbers may be forwarded by starting seeds in pots or on inverted sods, in a hot-bed or sunny window. When they are set out, cover at night by some kind of a hand-light or screen. Sow seeds in the open ground, protecting the plants in the same manner. Sow sage, thyme and other sweet herbs in a seed-bed, to be transplanted later. Plant a few horseradish sets in rich soil. It should always be taken up in the fall to prevent it from becoming a weed. Continue to transplant lettuce for a succession, and hoe often. Do not sow melons until the soil is warm; use an abundance of seed to provide for insects and accidents. Early weeding of onions by hand in the rows, and thorough cultivation between the rows, are needed, whether grown from seeds or sets. Early kinds of potatoes should be forwarded by good culture. A sprinkling of ashes and plaster at hoeing on some soils helps wonderfully. Tall peas

should have brush or other support early. If allowed to fall over before they have these, they rarely do well. The best substitute for brush is wire, as described elsewhere. Sow for a succession. Cut away the rhubarb flower stalks as soon as they appear. In cutting spinach for use thin it, to leave plants at six or eight inches apart for the final cutting. Sow weekly. When the soil is warm, sow New Zealand spinach for summer use. For squashes make richly manured hills eight or ten feet apart for the running sorts, when the weather is settled, and sow an abundance of seed. Give a trellis or some kind of support for tomatoes when they are first set out, and keep them tied up as they grow.

The Houstonia or Bluets as a Basket Plant.

For those who cultivate wild flowers, writes Margaret Donaldson, the *Houstonia cerulea* is fine for rock-work, and it is one of the best of our early wild flowers for baskets. On points of worn-out land, I have seen single flowers growing in the grass, on branchless stalks not more than two inches high. But when set in a basket of leaf-mould they branch freely, spreading over the sides of the basket, and bloom profusely long after their companions have disappeared from the meadows. Their roots are so diminutive, that they will thrive in a very small vessel. I once saw a clump growing in the inverted lid of a tea-pot. Give them sunlight, keep the soil moist, and they will grow in a cup, scarcely larger than an egg shell. They bloom in April, and some seasons one may look long before they find them, at other times they make a feature of the landscape. In the spring of 1882, there were acres of sloping meadow land, sky-blue with these flowers; on the same slope the following spring, they bloomed under the grass, but nowhere thick enough to be seen at a distance. Their time of continuing in bloom is not much over a month, but their earliness, faint fragrance and delicate beauty, amply repay one for the small amount of labor required for their cultivation.

Side Grafting.

To those who have never attempted grafting the operation seems to demand peculiar skill, and they are deterred from trying for fear of failure. One

SIDE GRAFTS.

of the simplest forms is the side graft, which is more easily performed than the common cleft-graft much used by florists and nurserymen in propagating camellias, some conifers, and other shrubs and trees. Unlike some other grafts it is not necessary with this to remove the top of the stalk. A clean downward cut is made in the side of the stock, and the cion, carefully cut to a wedge, is inserted, bringing its inner bark, on one side at least, in close contact with that of the stock. It is sometimes practised on fruit trees to replace a lost branch. It is not necessary to wax grafts of this kind; they are merely tied closely with bast matting or worsted yarn. The amateur will find much interest in practising with this graft as it will give him confidence to attempt more difficult kinds. It has been practised on herbaceous stems, even on those as tender as the melon, with success. The

engraving shows the method, giving the stock, the prepared cion, and the two united.

Narcissuses.—Old and New.

Those familiar spring flowers, the Jonquil and the Daffodil, are really species of *Narcissus*, and these, together with the beautiful Poet's *Narcissus*, are to be found in large clumps in all old gardens. In most cases they have received no care since they were planted, but have gone on, sometimes for years, increasing and crowding and starving one another until we frequently find masses that have ceased to bloom. These are the only kinds of *Narcissus* generally known; the *Polyanthus Narcissus* not being perfectly hardy is rarely seen in gardens, though it is sometimes grown in pots. There are over twenty species of *Narcissus*, while the number of varieties is very large. The

THREE LEADING FORMS OF THE NARCISSUS.

flowers in all have six spreading petals, the perianth. These are united below to form a tube, at the mouth of which is a petal-like appendage called the eup or crown. It is this crown that gives to these flowers their peculiar beauty; it often differs in color from the rest of the flower, and varies greatly in size, being in some species the most conspicuous part of the flower. The relation this bears to the divisions of the perianth (or petals) serves to arrange the species in three groups. The Long-crowned *Narcissus* have the crown as long or rather longer than the divisions; figure 1, represents a flower of this group. In the Medium-crowned group the crown is half or three-fourths the length of the divisions, as in figure 2, while the Small-crowned division has the crown less than half the length of the divisions, as seen in the well-known Poet's *Narcissus*, figure 3. The species, many of them at least, have produced double varieties; the crown is lost, its place being filled by a mass of irregular petal-like bodies. Of late years, some of the European cultivators have hybridized and crossed the species with most excellent results, some of the hybrids having larger and more beautiful flowers than the species. Some of the hybrids of *N. incomparabilis*, figure 2, are extremely beautiful. In their present improved condition *Narcissuses* are attracting more attention from cultivators than they have formerly received, and they are well worthy of it. It is likely that the majority of the new kinds will prove hardy, and when they become more abundant cannot fail to be popular. In some of the new forms are exquisite tints of yellow, the crown and perianth each being of a different shade. The Poet's *Narcissus*, though one of the commonest, is one of the most beautiful. The perianth is of the purest white, the very shallow crown, a mere eup, pale yellow, with its margin crisped and of a deep scarlet. By giving it good soil and preventing it from forming large clumps, the flowers will be finer than we usually see them.

Bee Notes.

REMOVING BEES FROM WINTER QUARTERS.—Like many others, bee-keepers are often deluded by a few first warm days into the idea that spring has really come, and they proceed to remove the bees from the winter repository to the summer stands. Even should warm weather continue a week or two, so much the worse for the bees, as they spread out and commence rearing large quantities of brood. When the usual "cold snap" follows, the bees are driven into a compact cluster in the center of the hive, and all brood outside of the cluster—brood reared at the expense of many an old worker's life—is chilled to death. Leave the bees in their winter quarters until sure that warm weather has really come to stay, which, in this latitude (Genesee Co., Mich.,) is usually about May 1st.—The laborious task of carrying bees to or from the

Fig. 1.—A HIVE CARRIER.

cellar, and the swaying about of the combs can be greatly lessened by two persons carrying the hives on a sort of hand barrow, like figure 1. Strips of some light, tough wood are bolted together, the legs extending several inches above the side rails, to prevent the hives sliding off when going up or down the cellar stairs. With this two men can carry four colonies with more ease and comfort to both themselves and the bees, than one man alone can carry a single colony.

GETTING READY FOR THE BUSY SEASON.—Now is the time to get everything ready for the busy season. This advice is not superfluous, for not only farmers who keep a few bees, but some of the "professionals," are prone to delay getting hives and other fixtures until swarms are actually hang-

Fig. 2.—WIRE COMB FOUNDATION.

ing in the bushes; and supply dealers are weeks behind in filling orders. Let the hives be made, painted and stacked up all ready for those swarms that are always coming "before they were expected."—Also put together the section honey boxes, supplied with comb foundation "starters," and place them into cases; then no honey will be lost when the white clover harvest comes. The edge of foundation where fastened to the box must be warm and soft.—For this purpose place the face of a hot flat iron near a pile of "starters," and when one iron becomes cool replace it with another hot one.

WIRED COMB FOUNDATION.—The large sheets necessary to fill the brood frames have given much trouble by stretching, warping and breaking down. To remedy these difficulties pierce the top and bottom bars of the frame with small holes, through which stretch and fasten fine wire drawn taut (fig-

ure 2) and imbed these in the foundation sheet warmed until it is soft. To imbed the wires many bee-keepers use a lady's shoe button hook, with a small groove filed in the back side. The groove is passed back and forth on a wire, applying some pressure. With a press the foundation can be manufactured directly into these wired frames. The wires, being at the bottom of the cells, do not in the least interfere with brood raising.

The "one piece" section boxes, now so largely used, are necessarily made from basswood that will bend into shape; but this soft wood absorbs every drop of honey coming in contact with it and leaves a discoloration. Another objection to the one-piece section is, that the openings between both the bottom and top bar do not extend their whole length, and the shoulders left cause much trouble by contact with adjoining combs. The dovetailed sections made of white poplar are fully as white as basswood, do not absorb honey, and do not have the mischievous projecting corners. The one-piece sections can be put together a trifle quicker.

Cultivating Sorghum in the West.

The rapid increase in the amount of sorghum planted from year to year, has stimulated ingenuity to discover ways and means of doing the entire cultivation by horse-power. Sorghum is a feeble plant and grows slowly at first, and unless the land is freshly turned up, weeds are apt to get up faster than the crop. The following seems to be the most successful plan: the land is plowed immediately before planting, or if done earlier, or in the preceding fall, the entire surface is cultivated with a two-horse corn cultivator before planting. The seed is planted quite thickly in drills, by using a two-row corn planter with small holes, moving the dropping lever quite fast, so as to drop the seed in an almost continuous stream. Those planters, that have a drilling attachment, are very convenient for doing this. At least twice as much seed is planted as is expected to grow, about six or seven pounds per acre is not too much. The most common mistake is to plant too deep, and much care is needed when a horse-planter is used, to avoid this difficulty. If the ground is moist, half an inch is deep enough, or even less will do. As soon as it is safe to do so without covering the young plants, go through the field with a straddle-row cultivator, taking care to have the inside shovels turned so as to throw the soil away from the plants. By setting them in this way, you can go much closer to the row than otherwise. Enough soil in any case will be thrown towards the plant, while you will stir the soil close to the young plants. After cultivation is completed, cross-harrow with any good harrow, going over the ground twice. This will destroy a good many of the plants, but as they were planted thick with reference to this treatment, no harm occurs, while those which are left are thoroughly hoed, and the soil mellowed. The whole surface ridged by the corn plow, is leveled down and put in fine condition for the next plowing. Should the cross-harrowing not thin the plants enough, the land may be harrowed the same way as the rows run. In ordinary seasons and on moderately clear land, this method of treatment will usually enable a grower to raise a crop without resorting to the hoe.

Seeding, Propagation, Covering.

The most carefully seeded meadow is the most productive. Grass seed should be sown with winter grains, because they grow thinner on the ground than spring grain; the young plants are less shaded, and the growth forms with stronger roots, and is better able to withstand the hot sun and dry weather. After harvesting the grain, the seeding is often destroyed, because the roots of clover and timothy are so near the surface that they dry up. The ground is crusty for want of cultivation and weight of snow after the grain is sown. The remedy is simple, but rarely used. The grain should be harrowed into the ground after it has settled, and is dry enough to mellow under the

harrow. Winter grain is improved by harrowing, affording a lighter soil for the spread and growth of the roots, covering the field with stronger growth, consequently increasing the yield. This process insures the certainty of grass-seeding; as seed is expensive, farmers cannot afford its loss, or "trust to luck." Two crops cannot grow in the same place simultaneously. Filling the ground with all it can support of spring grain, and sowing grass-seed at the same time, expecting to produce a fine meadow after the grain, results in a feeble product and after harvesting the grain, the weak plants shrivel and die. Spring grain must be sown thinner when sown with grass—then what is lost in grain, is gained in thickness of the clover or grass crop. Thinly sown grain generally produces heavier, larger heads and more stems, consequently the crop is not lessened. Grass is as important to farmers as grain, and should not be sacrificed for the chances on the latter. It should be made the primary crop, for the soil is renewed by it while it is exhausted by grain.

Surface manuring and thorough tillage are absolutely necessary—the more mellow the land, the surer and better the crop. The seed should be sown after the grain is harrowed in, and levelled by a roller, which smooths and settles the surface, insuring quicker germination. When winter grain is harrowed, the teeth do not penetrate sufficiently to cover too deeply the grass seed. More care in this preliminary work will save the loss of seed and secure better crops. Dragging brush over a stumpy or rough field is a good method for covering grass-seed. Four quarts of timothy is sufficient to seed an acre of land prepared in this way; five quarts of clover upon same conditions. Double these quantities are sown because farmers expect losses that occur by careless preparation. Better expend in careful tillage the cost of seed wasted, and reap the benefit, than be burdened with a poor crop and an impoverished ground.

Draining Suggestions.

In laying drains, especially if tile-drains in quicksand, begin at the upper end and work down. Earth, silt, and settling mud would be likely to

A WOODEN SILT BASIN.

collect behind the workers if commencing at the lower end. In laying tile without collars, and even with them, it is important to cover the joints at least with straw, hay, spent tan, or inverted sods, lest sand work in, and by collecting in chance depressions caused by uneven settling, choke the passage. A silt basin is important in drains subject to much sand and clay. This may be a simple box of double boards or plank, nailed to two by four-inch scantling, its interior one by two feet, and high enough to extend from the ground surface, to a foot below the bottom of the tiles. The cover may be fastened on with hinges and a pad-lock, if likely to be disturbed by boys. This is set near the outlet or other point needed, with the entrance pipe a little above the outlet one. The sand and mud will collect in the space below, and may be lifted out with a hoe, after heavy showers or a strong flow of water in spring. To keep mice from nesting in drains in a dry season, cover the outlet with a screen of galvanized wire; or drive iron rods in front; or attach to the tile a short piece of pump-log, and drive nails or spikes inward toward the center, thickly enough to exclude toads, moles, and mice, and all small vermin.

Poultry—Breeds for Laying.

The best breeds of fowls for laying, are those that suit the climate in which they are kept. It is an oft-repeated inquiry as to which breed is most suitable, by those who contemplate poultry keeping. Such inquiry can only be answered by those who have experimented with different varieties in different locations. There is no doubt that the Leghorns are equal to any other breed for egg-production, but it does not follow that they are the most profitable fowl under all circumstances. They are divided into two classes—the single, and rose-combs—and there is a further subdivision, according to color. The single-comb varieties of fowls are subject to frozen combs in very cold weather, but when properly managed they escape harm. The difficulty may be overcome by “dubbing” them, as is done with Games, but as the principal points of the Leghorns are given to the comb, they would thereby be disqualified from competition at the fairs and poultry shows. A frosted comb would not be very objectionable to those who only breed fowls for profit and not for exhibition, but when the comb becomes frosted, the hen ceases to lay until the injured member is completely healed. As the comb may be frozen several times during the cold season, the loss of time from egg-production, owing to the effect of the temperature, would be quite an important item. The double-comb varieties, though exposing quite a large surface to the action of cold, have their combs closer to the head.

In thus noticing so small a matter as the comb, the object is to present one of the difficulties in the way of keeping a breed that never sits, but lays well. While the breed may not find favor in cold climates, that is no reason why it should not be popular in other sections. As the Leghorns have their virtues and faults, so do the other breeds of fowls. In raising fowls for market, many object to the Brahmas and Cochins on account of their slow growth, and this objection may be a strong one if the fowls are to be sent to market as chicks, as they do not feather until well advanced. If matured fowls are intended for shipment, the largest carcasses, with fine appearance, may be obtained from such breeds. The Plymouth Rocks, which grow fast, and are uniform in appearance when young, also make good market fowls when grown, but, while they are excellent layers, they are liable to become excessively fat when highly fed, especially when they are confined, which is a hindrance to egg-production. This may also be an objection to the Brahmas and Cochins. The best results are derived from Plymouth Rocks when they have free range. All breeds do best with freedom, but the larger ones are more contented under restriction. It is best, therefore, in selecting a breed for laying, to take into consideration its hardiness, fitness for market, time of maturity, adaptability to climate, and disposition. By selecting that breed which possess qualities adapting them to the conditions of the particular section of country, the best breed for laying as well as for other purposes will be secured.

SPASMODIC COLIC.—“J. B.,” Lincoln Co., Kansas, writes: “I have a mare that acts very strangely. She paws and lies down about the same as though she had spasmodic colic. She eats and drinks not quite so heartily as when well. The attacks come two or three times a year.”—The animal undoubtedly suffers from sudden pain of a spasmodic character, most probably in the intestines. Spasmodic colic is due to a variety of causes, but more especially to food, excessive in quantity or improper in quality, and too much cold water immediately after fatiguing exercise. Sudden and complete change of food may also bring about this condition, as will exposure to wet and cold. Of course cramps, or excessive sudden pain, may be due to other causes, and may affect other organs. It is well to note in this case the exact circumstances under which an attack comes on—the kind and quantity of food and drink taken, whether it occurs before or after exercise, the condition of the bowels, and whether food is swal-

lowed greedily without proper mastication. Only thus can the cause be arrived at, and the proper treatment be selected. Some animals will continue to have spasmodic colic for years without appreciable cause. It is very important to keep the bowels loose, never constive. Bran mashies or roots given at intervals will be generally quite sufficient for this purpose without resort to drugs.

Very Cheap, Convenient Truck.

Mr. C. J. Long, Morgantown, W. Va., sends us a sketch and description of a cheap, easily made truck which he uses in cleaning out stables, etc. Selecting a grocery box of suitable size, he cut

A STABLE TRUCK.

from an old well windlass a roller one inch shorter than the width of the box, and bored a hole in each end, into which hard-wood pins were driven. A half-inch washer was put on each pin. The roller is held in place by two small strips of some strong wood. These have holes near the ends to fit the pins, and are strongly nailed to the sides of the box and extend back to a convenient length for handles. Any fairly regular round stick of hard-wood from the woodpile may take the place of the old windlass.

Willows and Willow Culture.

The common Osier, as stated in a former article, is not suited to the finer kinds of basket-work. The choicer willows are known to the English growers by names which give no clue to the species to which they belong, such as “Red Dutch,” “Pack-thread” and “Whip-cord” willows. The common Osier is largely used for making coarse and serviceable baskets, though it is not so good as the Golden-willow, which is always seen with us as a tree, but when properly cultivated, yields excellent rods. It is generally supposed that a damp soil is required for willow culture. This is a mistake, as the crop thrives best on a good grain land, and such is chosen in establishing a plantation. If the land is not in good condition, it is manured and prepared as for a grain crop. Willows are always propagated from cuttings, made from stems of a single year's growth. The cuttings are made a foot long, and sharpened at the lower end. The common Osier is set out twelve by twenty inches, and some of the finer kinds as close as eight by sixteen inches. These are the extremes, and other distances are given to other varieties, according to their size. All kinds are set as closely as they will flourish, in order that the shoots may grow up straight and without branches. In setting out the cuttings a planting frame is used. This is made of slats, held in place by end pieces. These slats mark the distances of the rows, and the places for the cuttings in the rows, are shown by notches on the slats. The planter sets a cutting opposite each notch, and forces it, in a slanting direction, quite into the ground with his hand, which is protected by a heavy glove. The surface of the plantation must be kept clean, using a cultivator at first, and when the shoots prevent this, hoes are used. When the leaves fall, the crop is cut. A strong curved knife is used, and the cut is made close to the ground. Though the first year's crop of rods may be of very little value, they must be cut in order to be out of the way of the next year's growth. The second year's crop is usually a profitable one. By this annual cutting the roots do not extend far, and are not difficult to remove when the soil is required for other crops. Every farmer would find it convenient to have a few willows to furnish rods for

withes and other uses. By cutting them close to the ground each fall, they will last indefinitely.

Steamed or Cooked Food, Profitable.

Mr. B. J. Stone, Westboro, Mass., has for twelve years fed steamed food to his herd of forty-five animals, from early fall until pasturing time the following spring. He has a twelve horse-power boiler in the basement of an L adjoining the barn, over which is a six horse-power engine, a plunge pump that raises water into the boiler, and a tank near the steam box and mixing trough. In the story above there is a large power cutter, that cuts all the corn-fodder, straw, and second quality of hay used. It is cut into one inch lengths. To three hundred lbs. of this cut fodder, one hundred lbs. of grain, four qts. of salt, and enough water to moisten it are added, and mixed in lots of eighty lbs. each to insure thorough mixing. This provender is pitched into the steam-box, which holds enough for one day's feeding. The first feeding is at seven P. M., the second at seven the following morning. At noon the animals are watered, then fed one hundred and twenty-five lbs. best quality of dry hay. The water which settles under the false bottom of the steam box, from about eighty gallons used at a steaming, is converted into a hay tea. This is mixed with sufficient wheat bran to make a mash, and is fed to milch cows and young calves. This food being well seasoned, is very palatable, readily eaten, and quickly digested. The warm food, together with the warm stable, keep up the animal heat, and a large flow of milk is the result. The cause of so many failures in steaming food is, in part, due to not using any grain, and allowing the steam to come in contact with the feed direct from the boiler. Here the steam is let into the bottom of the steam box, and softens the whole mass. The cooked grain is taken into the stomach of the animal, masticated with the cud, and nearly all of its nutriment thereby extracted. Below is an estimate of the daily cost per head. One-half of the fuel consumed, has been deducted and charged to the house, as this same boiler supplies steam, and heats sixteen rooms.

300 lbs. hay,	@ \$10.	per ton	\$1.50
125 “ “	@ 20.	“	1.25
100 “ grain,	@ 30.	“	1.50
75 “ bran,	@ 20.	“75
125 “ coal,	@ 6.40	“40
				\$5.40

Forty five animals at five dollars and forty cents daily, gives twelve cents per head a day.

Simple Head-Gear for Vicious Bulls.

Dr. L. D. B., of Vista, N. Y., writes us, that a young Jersey bull, inclined to exhibit a cross disposition, and to make too free use of his horns, yet being too valuable otherwise to part with him, the following device rendered him harmless and docile. With a quarter-inch auger a hole was bored near the tip of

A BULL WITH HEAD-GEAR.

each horn. Through these holes a number ten copper wire was tightly stretched between the horns, and three wires run to the ring in his nose, as shown in the engraving.—This will answer for younger animals not very vicious, but very large fellows would need something much stronger than a number ten copper wire; and even if a half-inch steel rod were used, a very unruly animal would crush a man with the rods themselves.

A Double-Latched Gate.

In answer to several calls for double-latched gates, we present the form shown in the engraving. There are two latches fastened to a jointed lever, so that when the upper end or handle is pushed backward or forward, the latches both move in the same direction. The construction of the gate, and the form and arrangement of the latches and lever,

A GATE FOR ALL LIVE STOCK.

are plainly shown. The importance of a double-latch to a gate is understood by all those who wish a secure barrier to both large and small farm animals. Horses and pigs, cattle and sheep, are alike kept within bounds by this method of fastening a gate.

Lumbering in California.

M. E. BAMFORD.

In riding through the coast range of hills east of Oakland, one sometimes sees by the roadside piles of wood ready cut and waiting for the Portuguese wood-chopper to bring it on his wagon down the long, dusty road to town. These men are met every little while, in the road, driving their carts to their daily labor, often carrying with them two or more dark-eyed children.—These Portuguese are very proud of their small, brown, two-roomed houses with their queer gardens of hollyhocks and marigolds seen once in awhile away down in some little nook shut in by hills. Many of them, who knew what poverty meant in their native country, feel rich as a king in the possession of a little garden-patch and a regular income from wood-chopping. What these are doing in miniature here is done on a much larger scale throughout the great forests of the northern half of California.—One of the most extensive lumbering regions is Humboldt County. Another lies between Truckee and Auburn. Along the Sacramento and its branches and the Pit River and its tributaries there are thousands of acres of fine wooded land yet untouched, and the Sierras themselves are an inexhaustible source of lumber, as the forests of the western slope cut down thirty years ago are already replaced by new trees.—The chief kinds of lumber in California are the redwood, the cedar, and the sugar and yellow pines of the Sierras. The redwoods are mainly found near the ocean, between thirty-seven and forty-two degrees. Those north of forty degrees are mingled with cedar forests.—The redwoods of Humboldt County are large to handle, and there have been different inventions for reducing them to lumber. Many logs are nine feet through, sometimes twice that, and of course much too large for an ordinary circular saw, which is never over six feet in diameter. Such logs are often first halved by wedges or powder. Those seven feet or more in diameter are divided by a "triple circular saw," as it is called, in reality there are four saws. Two of these take off a top slice, while the double circulars are cutting through the rest, the whole being done by one motion of the saw. This is peculiarly a Californian invention, necessitated by the great size of the trees.—Steam logging-machines are used in Humboldt County, the invention of John Dolbeer, of San Francisco, and are a great improvement on the former long ox trains.—A queer contrivance is used in loading redwood lumber on vessels when there are no harbors. Vessels are fastened off the shore by buoys, and a long wooden lumber-chute is stretched to them from the shore, the land-end being somewhat elevated above the other. Down this the boards and rail-

road-ties fly with great velocity, but a strong brake is arranged to check the speed near the vessel, and the lumber is let quietly down.

In the Sierras the sugar-pine is most highly esteemed for lumber, and is sent down the mountains in slides. Drives are used wherever there are streams, but in certain regions would be almost impossible without the V-flume, invented by James Haines, a Nevada man. He had expended all his capital on a square flume for transporting wood from the mountains, but, to his utter dismay, the wood stuck fast in places, and the water running over washed out the foundations of the flume. Not utterly disheartened, he mended the flume, but only to fail again; and others had a similar experience. Haines studied over the matter a long time with no success, until finally his little children helped him out. He noticed them throwing cobs and chips into a small V-shaped trough used in irrigating his garden, and that however many were thrown in there was no clogging. He changed his square flume to the V-shape by putting in boards to form a right angle at the bottom, flaring outward at the top. It was a success, he regained his money and this form has been in general use ever since in the Sierra Nevadas. They usually cost about three thousand dollars a mile, but in some steep, difficult places have run up to twenty thousand dollars a mile.—A great deal of the sugar-pine is made into doors, sashes, cornices, etc., and shipped to Central America, Mexico and Australia. The sugar-pine is much more durable than the white, is but little heavier, and is easily polished. It grows at an elevation of five or six thousand feet.—Though many thousand men are employed as wood-choppers the demand for more laborers is constant, and frequent notices in the mountain newspapers call for wood-choppers. Truckee, in Nevada County, on the Central Pacific Railroad, in the midst of a forest, carries on a large lumber-trade, and much charcoal is made here. All the snow-sheds of the Sierra Nevadas were constructed of lumber furnished by this town, as were also the railroad-ties and bridges of the Central Pacific. A single Truckee firm has contracted to supply ten thousand cords of wood annually for the next ten years. Then, too, the Southern Pacific Railroad is carrying enormous quantities of Truckee lumber to the treeless districts of Arizona and New Mexico, for use in the mines, on railroads and in building little towns springing up everywhere. In fact, about all the lumber used along the whole country traversed by the Southern Railroad comes from California, and there is a large demand for our lumber from South America and China.—Little narrow-gauge railroads are being built in several northern parts of the State to bring timber down to the main railroad lines. On Lake Tahoe is a steamboat specially made for towing rafts across the lake, whence the lumber is taken by a railroad to the top of the mountains and sent through a flume to Carson. A great deal of this timber is used in Virginia City and in the mines.—The first lumber ever prepared for sale in California was cut in Sonoma County, in 1838, by a Mr. Dawson, who prepared it with a whip-saw. The first saw-mill in the State was started, in 1843, at Bodega Bay, in the southwestern corner of this county; and this was the only saw-mill in the State until after the Americans took possession of it. The second one was begun in San Mateo County, and the third was Sutter's saw-mill at Coloma, but it did nothing with lumber, for it was while excavating the tail-bed of the mill that gold was found, and California was soon filled with an excited crowd too eager for gold to bother with lumber.—There are now seventy-nine manufactories of lumber in San Francisco alone, and the lumber stevedores there have quite an association, the "Lumberman's Protective Union," which spends several thousand dollars yearly in caring for their sick.—There is a good deal of interest just now in buying up the timber lands; the Government price being the same as that for mineral land, \$2.50 per acre in divisions of one hundred and sixty acres. This interest dates from last summer, when a Buffalo, N. Y., syndicate purchased the finest lumber tracts in the

State. Now the newspapers are teeming with advertisements of timber lands, and there is every prospect that many places yet left undisturbed because too far from any railroad transportation, will soon be opened.—But though there is so much lumber in the State, the production being about three hundred billion feet annually, yet we have no hard-wood suitable for making plows, casks, etc., and are obliged to import about three million feet of hard-wood annually from the Mississippi Valley.

Wild Vines About the House.

EBEN E. REXFORD.

While admitting that many foreign plants are all that is claimed for them, I like our own native ones best, because I see great merit in them. I never have understood why persons of excellent taste should neglect them, unless it is because they are not familiar with them. There is no finer vine for use about the house than the Virginia Creeper, (*Ampelopsis quinquefolia*). It is found almost everywhere at the North and is hardy. It grows rapidly, is easily transplanted, has beautiful foliage, and is a miracle of gorgeous coloring in autumn. After the leaves have fallen its purple berries are more ornamental than the flowers of many plants. It is, or should be, to us Americans, what the Ivy is to the Englishman. If you want something to drape the veranda, you can select nothing better. If you wish a vine to climb up to, and all along, the eaves and around the second-story windows, this is the very plant to get. The Virginia creeper is a robust, self-reliant vine, and will take care of itself and delight all with its luxuriance if it is given half a chance.

Another very desirable vine is the Bittersweet (*Celastrus scandens*). It has beautiful, bright foliage, which is seldom infested with insects. During the later part of the season its clusters of scarlet berries, enclosed in orange husks, which part and disclose the fruit within, are showy enough to suit any one. These berries hang on all winter if the birds let them alone. For verandas and porches the Bittersweet or Wax-work is quite equal to the Virginia creeper, and that is high praise.

Another most beautiful plant for those who do not consider that beauty depends on bright and vivid color, is our native Clematis, or Virgin's Bower. This vine has fine and vigorous foliage, and in July is covered with thousands of delicate, white flowers, of delicious fragrance. One of the finest effects that I have ever seen produced by growing two plants together on a trellis, was made by training a Clematis among climbing roses. The contrast of the pink and white flowers was simply exquisite, and the dainty grace of the Clematis added a greater charm to the roses. For use in vases in the house, the long sprays of Clematis, when in bloom, are finer to my mind than anything else to combine with flowers of vivid color. It is easily transplanted and, like the other two native climbers, will take care of itself.

A Grind-Stone Rest.

The accompanying engraving shows an attachment to a grind-stone, upon which tools may rest

A GRIND-STONE TOOL REST.

while being sharpened. It consists of two small upright pieces, firmly fastened to the sides *a, a*, of the grind-stone frame, and bearing a cross-bar, *b*, at their upper ends. One of these rests can be made in a short time, and will add greatly to the comfort and convenience in grinding various tools.

A Convenient Pasture.

A pasture close to the farm buildings is a great convenience, and will save much valuable time during the busy season. The work horses may be turned into such a pasture in the evening after they have eaten their ration of hay and grain. It is an easy matter to bring the horses in again in the morning for their feed, before it is time for work. The cows may go to the back feeding ground for the day, and into the front pasture to pass the night. Boys who are tired from hard work through the day, appreciate the convenience of a pasture close by the milking ground. The cows are more contented if kept near the barns at night. The gates and other entrances to this night pasture should be arranged to save all possible steps, both from the horse stable and the milking yard. Some may object to having horses and cows in the same field, but the writer has concluded, after several years' experience, that there is no danger with any ordinary animals. Young stock of all kinds will be safer if kept from the old in a separate pasture.

This convenient night pasture should be permanent, and furnish good feeding to the horses and cows throughout the whole season. It therefore needs to be kept in good heart. If naturally rich, the droppings from the animals will keep up the fertility for several years. A man with a manure pick or mallet, should go over the pasture each spring, and loosen and scatter the droppings. The mallet consists of a block of wood a foot long, square at one end and pointed at the other, into which a stout handle is fastened near the middle.

A top-dressing of well-rotted manure should be given every two or three years, or still better, a light dressing each winter. A hundred pounds of nitrate of soda per acre in early spring, aids greatly in giving a vigorous start to the young grass. If coarse weeds appear, they should be rooted out before they become thoroughly established or ripen any seed. A flowing spring in a central location, is of great value in any pasture, and especially here where cows may drink after being milked, and again early in the morning. It will also save much labor in watering the horses before and after work. If a flowing spring cannot be found, the next best water supply is a well with a wind-mill pump.

A pasture properly manured, kept free from weeds, and thickly seeded with a large variety of grasses, may be as permanent and profitable as any field on the farm. The night pasture does not enter into the regular rotation adopted for the other fields.

Horse-Power from a Mowing Machine.

Mr. C. S. Currier, Almont, Mich., sends us a sketch and description of a horse-power and "jack" made from an old mowing machine. The whole cash outlay was fifteen dollars and sixty-three cents. The upright frame of the power is

Fig. 1.—A "MOWING MACHINE HORSE POWER."

the old machine woodwork set up sideways with one of the drive-wheels on top. To this is attached a draft lever twenty-two feet long, with hooks on each end so that one or two horses may be used. The lever and lead stick are bolted to the rim of the wheel by a hook bolt on each side. The fly wheel on the "jack" is the other wheel of the mower. This wheel was removed and the shaft cut off even

with the frame. The end timbers of the "jack" below the wheel are cut half down so as to let the wheel as low as possible and have the belt clear. The left side shows the way the tumbling rod is attached, and let down for the horses to pass over easily. The rod is attached in the same manner to the power. In figure 1 is a collar in which the "shipper" worked to throw the mowing machine in gear. The "shipper" was removed. The collar is held down by its weight. When the

Fig. 2.—THE "JACK" OR BELT WHEEL.

"jack" wheel runs faster than the power this collar rises and lets it run until the power obtains the same speed, when it falls down and the power is in gear. This machine is light and strong. It will furnish all the power that is required to shell corn or cut fodder, and in fact anything a two-horse power is able to run. Use a four-inch rubber belt.

Among the Farmers.—NEW SERIES.

BY ONE OF THEM.

In going about more or less among the farmers, I find that those who make money, do so by producing specialties, and rarely by their general farming. He who has been farming for ten years, or even for five, to say nothing of him who was brought up on the farm, and has not found out what he can raise that pays best, is not wide-awake. One class raise hay to sell, buying manure from the town, and find this more profitable than to feed it. Another makes early potatoes a specialty, or perhaps combines these with milk (most country boys know potatoes and milk go well together). Others calculate upon some other crop for their principal source of money. Fruit farming has attractions for those who can secure pickers at the time small fruits or peaches are ripening, and a good many try some particular vegetable, like sweet corn, celery, Swedish turnips, or cabbages. Even where the old system prevails, and the ancient rotation of corn, potatoes, or oats, winter grain, and grass is the universal order, one man's specialty is well-fatted beef, another's early lambs, another's turkeys, and yet another prides himself on his pork. The class of those who raise thorough-bred animals, horses or cattle, sheep or swine, dogs or poultry, is larger, and so attractive is this, that many more undertake it than have either the knowledge or patience to make it a success. They are good customers for those whose herds and flocks have achieved fame, and thus they are useful.

Cattle Ties.

Their name is "legion," and while there may be no novelty in the one which I write about, there is merit in it, and for most people that is better.

The stanchion has its advantages, which are so great that farmers who are not cruel, and who may on the contrary be regarded as intending to be merciful to their beasts, use them. The cattle are resigned to them, much as the man said his wife was resigned to dying, "there was no help for it, she had to be." Neck chains attached to a ring to slide up and down upon a perpendicular bar or rod, give the cows more freedom. They can lick one side at least, and lie down with the appearance of comfort which they can not do in the stanchions.

The chains which I am now using, and with which I have no fault to find, combine the advantages of both stanchions and the common neck chains, besides sundry merits of their own. The idea is not original, I saw something of the same kind at a breeder's establishment some time ago.

My floors were arranged for stanchions, which never were put in, but instead, I had round bars set perpendicularly four feet apart, upon which the common neck chains were used, there being short partitions between the cows. These partitions I had recently cleared away. A two-inch plank, eight inches wide, set on edge, forms the front of the manger or feeding trough, and the round bars stand close to this. The tie-chains each consist of two rings, *r*, which slide up and down on two of these bars; the rings are connected by a chain which has a small ring, *s*, in the center; attached to this ring is the usual neck-piece *n*, and a snap-hook, *h*. Thus the cow is fastened to the middle of the chain, between the posts. She has free motion of her head, up, down, and sideways. She cannot reach her neighbor on either side. She cannot steal their feed, nor touch them to do injury with her horns. Yet she can lick both her own sides, can get up or lie down without straining or slipping, and has a limited back and forward motion, so that she can neither step forward into her manger, nor backward off the floor, over the edge of which the manure is dropped as nicely as if she stood in stanchions. The accompanying engraving gives the reader an idea of how to have these chains made. I obtained mine through a wholesale chain dealer, who had a few dozen made up according to my description.

If I was to suggest an improvement, it would be to have the center ring furnished with three snap-hooks, one to fasten the neck-piece, and one to connect with the ring-chain on each side. Thus the chain might be made shorter by taking up one or two links at will, in order to fit posts set a little closer, or to give the cows a little more liberty. I have never had a cow get her foot over the chain, or when one place was not filled, attempt to lie down across the stall.

Farm Chains.

Speaking of chains, I am amazed to know the difference in chains. I have been in the habit of buying at agricultural warehouses the best trace-

CHAIN CATTLE TIE.

chains I could, and nothing has been more common than for them to break. Links snap off, the chain breaks in two, the links bend sometimes, and they wear out very fast. We wire them or link them together, and so make out to use the patched things. Other people have the same experience. The reason is, that the store-keepers buy cheap American made chains, trusting to our ignorance of better ones, charging a round price for them, and expecting us to buy more as soon as they break. One advantage of being near New York, is that for some things which a farmer must purchase, one can go to headquarters. Now I have a set of trace chains, which will last as long as I shall have use for them.

Profitable Pork.

There is a constant demand in the New York market for small pork, and people are becoming fastidious. The effort to supply this demand by thin, poorly grown pigs of eight months to a year old, is vain. Such are not wanted, but plump four or five months' pigs that weigh one hundred to one hundred and twenty-five pounds. These pigs bring the highest market price, and may often be disposed of to special customers, at a considerable advance upon the prevailing prices in the market.

I was visiting a large farm a few days ago, where big Chester white brood sows are used, crossed with small Yorkshires, and a really beautiful class of pigs produced. They seem always fat, are extraordinary easy keepers, and are so plump, small-boned, small-headed and white as snow. The sows are great milkers, have big litters, and the pigs

grow like weeds. They are fed chiefly on skimmed milk, with a little meal and bran, and are hardened off before killing with corn or other grain, but require very little. These pigs until a short time before they are killed, have the run of an extensive manure cellar, where it is warm in winter and cool in summer, so that they are always comfortable, and their growth always rapid. I do not know that the market is ever glutted with this style of pork. For its economic production, however, skim-milk is almost an absolute necessity. I believe the best pig pork that can be made, is that of a first cross between large Berkshire sows, and small Yorkshires. They are always white, compact, small-boned, very quick growers; keep fat with food upon which pigs of the coarse breeds would half starve, and the pork partakes of the character of the Yorkshires; the fat and lean is interlarded, and juicy and tender. The Essex produces a similar cross with Berkshire sows, but the

the roots, they will anchor the tree, and serve as an excellent mulch to keep the surface soil moist.

After the fall-planted bulbs—Tulips, Hyacinths, Narcissuses, etc., have bloomed, do not disturb them as long as the leaves remain green. When the foliage begins to turn yellow, the bulbs may be taken up, dried, and kept until time to plant next autumn. Gladioluses, Lilies, etc., may now be planted. Tuberose may be left until the soil is well warmed, or they may be started in boxes of earth in a sunny window. If no hot-bed is at hand, place dahlia roots in a sunny corner, and cover them at night. When the buds start divide the roots.

Northernmost Garden in the United States.

In the summer of 1883, a small exploring party, under command of Lieut. Schwatka, of the U. S. Army, crossed the coast range of the Alaskan Mountains from Chilkat, and reached the head of

and cultivation almost out of the question. Mr. Harper has chosen a southeastern slope on the river bank, and here the immediate drainage has helped him to raise this phenomenal garden. The northernmost spot on the globe where rye and oats ripen, is at Kengis, in the Swedish Province at Norrbotten, forty-nine miles to the north of the Arctic Circle. The northernmost place where corn matures is at Muoniovara, ninety-eight miles north of the Circle, and is located just the same distance above, that Mr. Harper's garden is below it.

The Great Laurel, or Rose Bay.

Among the finest native flowering shrubs in this country is the Great Laurel (*Rhododendron maximum*). So far as foliage is concerned, there is nothing finer among the cultivated Rhododendrons. Were it without bloom, it would be an attractive shrub in any ornamental ground. But the blossom, though inferior to most of the seedlings of the *R. Catawbiense*, is still charming in a state of nature, and both foliage and flower have been wonderfully improved under proper treatment. Of course the best are to be chosen where means are abundant, but the prices of the cultivated varieties are still so high, that our rural population do not feel that they can afford them. But the *R. maximum*, in many localities, is as common as almost any other shrub, and can be had for the trouble of transplanting. This Rhododendron is found from the southern part of Rhode Island, through New Jersey, southward, and is seen in great profusion in the mountainous regions of Pennsylvania and further South, and is one of the attractive features of a railroad trip through that region in the early part of July. It was a great favorite with the late Asa Fitch, and his place at Fitchville, Ct., had large plantations of this shrub. It was the most striking feature of the place, both in summer and winter. In its natural state, under the shadow of large trees, the shrub grows to fifteen or twenty feet high, has a straggling habit and the trunk reaches a diameter of six or eight inches. In a congenial soil, which should have a large portion of peat and sand, or leaf mould and sand, it grows much more compactly, the foliage is more dense, and the flower buds, which form in the latter part of summer, are greatly multiplied. In village lots, where room is scarce, it can be planted in the border near the house, or by the live fence, though, like most other plants, it needs room and sunlight for perfect development. In its natural habitat it grows freely from the seed, and young seedlings are readily gathered for transplanting to nursery rows, or to be set in place. There is no special difficulty in transplanting or managing the plants, aside from the peat and sand which best meet its wants. In the wild state it has a tendency to bloom more profusely in alternate years. In cultivation, the early removal of the very numerous seed pods after blossoming will remedy this imperfection.

Green-house and Window Plants.

It is usually the custom to turn everything out of the green-house on the approach of warm weather, but with a little care in watering and shading, the plants will do much better, and be less liable to injury from insects, and accidents, than if turned out. If plants are to be removed, place them where they will be sheltered from heavy winds, and not be exposed to full sun. They should also be where their condition as to water will be noticed. Plants turned out from the pots and planted in borders, are seldom worth taking up again at the end of the summer. It will be well to make cuttings of such plants and start anew. Fuchsias and cactuses for the most part are summer bloomers, and may be usefully employed in decorating the veranda. They show best when seen from below. All repairs in green-houses, glazing, painting, etc., should be made in summer, that the houses may be all ready long before they will be needed.

THE NORTHERNMOST GARDEN IN THE UNITED STATES.—Engraved for the American Agriculturist.

pigs are black, hence rarely favorites at the North, though prized in hot climates as they are free from skin diseases, and not poisoned by the "Paint-root."

The Flower Garden and Lawn.

It is late to expect the best results from sowing grass seeds, and if the lawn is of but moderate size, it will be better to lay sods. The turf from a road-side or pasture should be well beaten down to bring its roots in contact with the soil. If grass-seed is sown as late as this month, it is customary to add a sprinkling of oats—say a quart to a bushel of grass-seed. The object of this is to afford shade to the young grass, and it is well enough if the oats are not allowed to go to seed. They should be cut early. The lawn should be mowed with a lawn mower, every week or ten days, until dry weather comes, and then the frequency should depend upon the growth. Do not cut up the lawn with too many beds. Place them near the drives or walks where they will be seen. They may be planted in masses of one kind each, or in ribbons of contrasted colors. In either case make the soil rich, and keep the grass margin well defined.

This is the month in which nurserymen advise evergreens to be transplanted. Success with evergreens depends upon keeping the roots from drying. If the roots of a deciduous tree dry out, they can be restored. Not so with the conifers. If their roots are once allowed to dry, no moisture will restore them. Whether evergreens are to be removed from a nursery, or from pastures, keep the roots well covered. When they are set out, if several stones, as large as one can lift are laid over

the great Yukou River, over two thousand miles long, and there built a raft and floated down this stream over one thousand three hundred miles, exploring and surveying it as they went along. At Nuklakayet, some seven hundred odd miles from its mouth, the first white trading station was encountered, although a few abandoned ones had been met before—and the raft exchanged for a civilized boat. Nuklakayet is near the junction of the Yukon and Tanana, in latitude 65° 08' North, and therefore eighty-five geographical, or ninety-eight common miles from the Arctic Circle. The station was kept by Mr. A. Harper, and here he had raised a small garden of vegetables, as shown in the illustration from a photograph taken by Lieut. Schwatka's party. This garden is the most northern one in the United States, within a day or two's journey of the Arctic Circle itself. The predominating vegetables were turnips, the largest of which raised last year weighed a trifle over six pounds. A few other hardy plants make up the small, but interesting garden. The greatest obstacle in gardening in this valley, is the dense swarms of mosquitoes that abound from the time the snows disappear in the spring, until frost comes in the fall, and makes life a burden for all kinds of animal existence. Another almost equal, is the character of the ground. In winter, with the thermometer at from 50° to 60° below zero, the soil freezes to six or seven feet in depth, and in the short hot summer it thaws but two or three feet, leaving a substratum of ice that holds the water, and makes even the sides of the hills marshy, and more like a bog than tillable soil. This marshy character gives rise to a luxuriant superficial moss, that grows everywhere and makes walking toilsome,

The Laying Out of Small Grounds.

ELIAS A. LONG.

If one has grounds of several acres to embellish, a garden architect is likely to be employed, as it requires not only taste, but skill and experience, to manage so large an area to the best advantage, while the small areas are frequently undertaken by the owner himself. In the embellishment of small plats, such as the front yards in cities and villages, a considerable variety can be produced by the proper management of grass and shrubs, with climbers over the verandas or porches at the doors. In figure 1, two shrubs only are used with climbers at the house. These shrubs may be a Weigela and a Rose of Sharon, or any others that may be preferred. In figure 2 a larger number of shrubs is used, and these arranged in masses or groups. If the ground where they stand is somewhat undulating, a greater variety in the effect will be produced. Only few shrubs being used, the selection should be choice, consisting of those that afford a good variety of tints, in foliage, and flowers, and in their season of bloom. Some of the number might be dwarf evergreens, to give the eye something to rest on in winter. Small-sized shrubs proportioned to the size of the ground are to be chosen usually in such places; the geometrical or straight lines of the house, street and walks have such an overpowering influence, that there is little chance to work for the higher garden effects of breadth and freedom. And yet in these plans the principle upon which such effects depend is observed to the full degree allowable in so small an area, and with good results.

The Parisians have a pleasing mode worth noticing of using flowers in decorating their lawns. It consists in running a narrow border several feet

The following excellent suggestions apply only to places of considerable area. Where a beautiful garden fronts on a public highway, it is as commendable in the owner to allow passers on the street to get glimpses of the interior, as it is to have thought of the effect of a fine house upon a neighborhood. But then a garden is designed chiefly for the pleasure of the owner's family and

Fig. 4.—LONG VIEW THROUGH GROUNDS.

friends, and he likes to enjoy it in seclusion. It is a luxury to sit at ease or swing in a hammock on a summer's day, and drink in the sights, sounds and perfumes peculiar to a garden, without fear of interruption, and this seclusion should be provided for. Figure 4 shows how masses may be set so as to give the public some benefit of a garden, and yet render portions of it secluded. It will be seen that an extensive view of the grounds may be had from the street, while by proper arrangement of trees and clumps the house is little if at all exposed.

The Law of the Road.

The "Law of the Road" regulates the conduct of persons travelling on the highway. Farmers make so much use of the highways leading to and from their farms, that this subject is to them one of much importance. A highway is any road which every citizen has a right to use. The law applies to every highway which the public uses, whether it is a legal road or not. If the public uses the road even wrongfully, this law applies to all persons, while there.

TURN TO THE RIGHT.—The most important law of the road is, that when two persons in vehicles coming from opposite directions are about to meet, each shall reasonably bear to the right of the middle or travelled portion of the road, so that they can pass each other without interference. A traveller is not required to keep on the right side of the road all the time; he can drive where he pleases or where the going is best, so long as he turns to the right when he meets another vehicle. If the middle and usually travelled portion of the road is very muddy, and for this or any other reason persons are travelling along the side of the road, then the one who is on the left side of the road is in duty bound to turn out. In Massachusetts it was held that when the part of the road which is wrought for travelling is hidden by snow, and a path is, beaten and travelled on the side of the wrought path, persons meeting on such side path are each required to drive their vehicles to the right of the middle of it. It should, however, be remembered that this law of the road is not an absolute and inflexible one. Circumstances may arise which would justify a deviation from it, and when they do arise, a traveller cannot stick blindly to the law, and then claim damages if he is injured. In the crowded streets of a metropolis drivers are required to exercise very great care, and when this high degree of care dictates a departure from this law of the road, then it is not only justifiable, but a failure to observe it might cut off one's right to recover damages if he is injured. This turning to the right is just the opposite of that in England, which requires all drivers to turn to the left. The rule of turning in England is based on long-honored custom; our rule is established by statute in the several States of the Union.

AS TO PASSING.—When travellers are driving in

the same direction on the highway, and one wishes to pass ahead of the other, the rule in England requires the foremost traveller to bear to the left and allow the other to pass on the off side. In this country there is no rule on this point. The foremost traveller is not obliged to turn out at all, but may continue to travel the middle or either side of the road at his pleasure, if there is room for the

other to get by on one side or the other. If there is not sufficient room for this, it is a duty to afford it if possible, by yielding up an equal share of the road, on being requested to do so. If one refuses to do this, he is answerable for the damage caused the other by delay; though such refusal would not justify the other in forcing his passage, and so causing a collision, as he has redress by due course of law. Neither of the foregoing rules of the road apply to horse-cars. The owners of horse-

car lines have the right to the unrestricted use of their tracks, though it is not unlawful for others to drive on the tracks if they do not unnecessarily obstruct them.

CROSSING ROADS.—Where roads cross each other, the rule is that travellers on each road must use due care and prudence to avoid accident and delay. They must act as reasonable and right-minded men would under the circumstances. Some early cases hold that travellers approaching from the side street must see to it that they do not interfere with the rights of travellers on the main road. As there may be dispute as to which is the main road, the rule above stated that the travellers in each road must take care to avoid injury, is the safe one to follow.

HORSEBACK RIDERS.—In England equestrians are subject to the same rules respecting conduct in the road as are persons driving in vehicles; but in this country there is no law of the road respecting them. A man on horseback meeting a horse or vehicle is not with us required to turn to any particular side, as to the right or left, but he "must govern himself in this respect according to his notions of prudence at the time and under the circumstances." There is an honored custom with us, sanctioned by common consent and immemorial usage, giving it the force of positive law, that a person on horseback should yield the travelled path to one who is travelling in a wagon or other vehicle. Common sense and propriety indicate such to be a fair rule. An equestrian or a foot passenger has just the same right of way that the driver of a vehicle has, but the enjoyment of the right is to be regulated by reason, and it is not such that either can compel a teamster, especially with a heavy load, to leave the beaten track of the highway, if there is sufficient room for them to pass on either side.

It has been held that where two travellers in the highway strive to get into the same place at the same time, the one is at fault who first uses force.

FOOT PASSENGERS.—All persons have the same right to walk in the highway that they have to drive there, and they have the same right to walk in the middle of the street that they have to walk on the foot-paths at the side. When one is walking in the wagon track, he must observe greater care to avoid collision with vehicles, but the fact of his being there is not of itself negligence. It is his duty to turn out for teams, especially if heavily laden, but teamsters have no right to run over him simply because he happens to be in the way. They would be liable for the injury if they did. Foot passengers have the undoubted right to cross the street at any time and place, and persons driving along it must use due care not to run into them, and must hold up to let them get by. The foot passenger must also exercise due care to avoid injury, for if he does not, he can recover no damages if injured. If he sees a team coming at a rapid rate he is not justified in attempting to cross ahead of it, or should he attempt crossing a crowded thoroughfare without first looking carefully both ways.

RATE OF SPEED.—The rule that persons using

Fig. 1.—ARRANGEMENT OF TWO SHRUBS. Fig. 2.—SHRUBS IN MASSES.

in from the edge of grass plats, on four sides, with some openings to the center, as shown in figure 3. These borders are usually from three to six feet wide, with the plants arranged in the mixed irregular style and quite uncrowded, with usually an edging of some bright low plants. It is a charming style, and the effect is largely due to preserving an ample central plat of grass. A pleasing feature

Fig. 3.—PARISIAN LAWN DECORATIONS.

is the introduction of some handsome shrubs along the center of the borders, at equal distances apart. Altogether the arrangement is very satisfactory to the eye, and worthy of adoption in our gardens when they are of sufficient area to admit of it.

the highways must exercise due care to avoid accident and injury, includes an observance of the duty to drive at a moderate rate of speed. To drive faster than an ordinary reasonable travelling pace upon the highway, and especially upon the streets of a city, is not only culpable negligence, but is prohibited by statute or municipal ordinance. What is an immoderate rate of speed, in the absence of a statute upon it, is a question for the jury to decide. The Supreme Court of the United States said it was "such rapid driving as under the circumstances amounts to rashness." In Pennsylvania it was held that driving at a rate of fifteen miles an hour, or an hour in four minutes, on a public highway was unlawful, and that if death resulted from a collision caused by such driving, without any fault of the injured party, it would amount to murder in the second degree.

HENRY A. HAIGH.

A Seed Bed for Forest Trees.

A. S. FULLER.

For most of the deciduous trees the open field is a good situation for a seed-bed, no shade being required for the young seedlings, except in rare instances. The preparation of the soil should be most thorough, not only should it be plowed deep, but cross-plowed and pulverized with a harrow, until in fine tilth and free from all lumps and stone. If the land is not rich it should be made so, by liberal applications of very old and well decomposed barnyard manure, or some other good fertilizer, but no fresh stable manure or other kind that will make the soil too open and loose, should be used. When all is ready, the seed should be sown in drills far enough apart to admit of cultivation, with plow or cultivator. There are two methods of sowing, the single drill and in double or narrow beds. The first is more convenient for thorough and clean cultivation, but the latter is sometimes preferred, where the space to be devoted to the purpose is limited, or where it is desired to raise a very large number of plants on a given area. Small seeds may be sown with a seed-drill, when convenient, or the single drill may be opened with a plow or marker made for the purpose, or even opened with a hoe drawn along by the side of a line for a guide. The depth of the trench must be varied according to the size and kind of seed to be sown. For maple, ash, locust, and similar kinds one-half inch of soil is sufficient for covering, but the larger nuts should be covered a little deeper. Judgment should be used in all cases, and the depth of covering be varied not only with the size of the seed but with the nature of the soil. If this is light and sandy, or contains so much vegetable matter that it does not become compact, and the surface hard after heavy rains, the seeds may be covered deeper than in one of an opposite character.

On sowing in what are termed double trenches or narrow beds, a trench a foot wide and of proper depth is opened, the soil being thrown upon one or both sides. The seeds are scattered in the bottom of the trench, and the soil drawn back over them.
